An alternative understanding to these traditional concepts of stateness was proposed by Linz and Stepan (1996), who argue that stateness is an undertheorized concept: "our point about undertheorization concerns in particular the triadic inter-relationship between the modern state, modern nationalism, and modern democracy" (Linz and Stepan 1996, 16). They continue that "a modern democratic state is based on the participation of the demos (the population), and nationalism provides one possible definition of the demos, which may or may not coincide with the demos of the state" (Linz and Stepan 1996, 16). An analysis of state capacity is the study of the "stateness problem": when there is a difference between actual territorial boundaries of the state and territorial boundaries of the political community of citizens, who identify themselves with the state. The "stateness problem" is as big as, as much citizens of the population of the state territory are not recognized by the state as citizens or as many of the citizens do not identify themselves with the state. Linz and Stepan define stateness through "identification with the state" when "large groups of individuals in the territory" do not want "to join a different state or create an independent state" (Linz and Stepan 1996, 7). This definition should be specified by adding such indicators of high state capacity as a low level of citizen identification with alternative state identities (global and local), the lack of public wish to emigrate (including inner migration), and other identifications with the state (national pride, knowledge, use of national symbols, etc.). This tradition to identify stateness can be called the ***"socio-cultural approach"*** as it raises the identity issues – not only the question of citizens' identification with the state – but also the questions of national and civil identity of the people.

The fourth tradition for state capacity analysis is the ***"synthetic approach"*** that tries to combine all three above approaches or traditions and give a generic definition. One of the attempts to synthesize these traditions was made by Russian political scientist Il'in (2008). He compared different dimensions of stateness with Aristotle's "four causes of change": driver or moving cause (kinoyn), substance or material cause (hyle), prototype or formal cause (eidos), and aim or final cause (telos). Accordingly, there are four aspects of the state: statehood as being a part of community of recognized independent states; stateness as the capital and resources which allow the state to function; stateness according to Linz and Stepan as citizens' identification with the state; finally, the state's aspiration for autonomy, self-sufficiency, independency, and sovereignty. In other words, state capacity is high, when, first, it is recognized by the other states as an actor in the international arena; secondly, the state has successfully concentrated enough recourses to govern; third, as the result of the first and second, the state is recognized by its citizens as the motherland; and based on all these three dimensions state became a central actor in the national political system.

**The concept of governance** is much more complex and complicated than the notion of stateness. More complexity is added because of the close tie between the phenomenon of state as "in political and administrative theory, governance used to imply statecraft" (Stivers 2008, 15). The universality of the phenomenon of governance leads to the existence and multiplication of many definitions of governance. Rod Rhodes (1996) identifies six, Kees van Kersbergen and Franz van Warden (2004) – nine different meanings of governance. Endless lists of governance concepts lead Claus Offe to conclude that governance is "an expression without any precise content" (Torfing et al. 2012, 12–13). The notion of governance is used in many different contexts and often in conjunction with a particular adjective: global governance, corporate governance, good governance, etc. But this makes things even more complicated (Torfing et al. 2012, 12–13). To manage this complexity the governance definitions can be summarized in four general approaches.

***The first approach*** in defining governance can be called ***"state-limited"*** as it first of all argues for a shift in governing from rowing to steering, from command and control regulation to "soft" regulatory regimes, paying attention to government accountability, transparency, client orientation, the

reduction of corruption, and other features of "good governance." This approach correlates with using the concept of governance in Developmental Studies and Legal Theory, to grasp the processes of the limitation of state functions and authority and a new public management movement.

*In Developmental Studies* governance is defined with reference to the "less developed countries," which need to develop "good governance." It means that the government has to reduce corruption and establish other elements of more accountable and transparent government, like free and fair elections, increased administrative and fiscal capacity, following the rule of law principle in public administration, and opposed to nepotistic and clientelistic structures, a personalistic form of governing and informal patterns, and institutions (Torfing et al. 2012, 36–38). This approach to conceptualizing governance is very close to the historical and functional approaches to define stateness.

*Legal theory* does not propose an alternative conceptualization of governance but focuses on the interaction between governance and other related notions of "rule of law" (that "good governance" is viewed as an element of effective governance), "reflexive law," and "soft law." The pathos of this discourse is a switch from command and control regulation to "the use of instruments such as benchmarks and voluntary agreements" (Torfing et al. 2012, 45–47). Government has to base its decisions on rules and regulations developed in interaction with other stakeholders and nongovernmental actors. Thus, "rule-based governance" (World Bank 2016a) and "regulatory governance" (Levi-Faur 2011; Minogue and Cariño 2006) are the notions with adjectives, which try to specify this aspect when the government needs to coordinate the interests of diverse policy actors to establish rules for policy-making.

In *Public Administration* there is the widespread understanding and practice of delegation of public services to governmental agencies which are more or less autonomous from higher state-officials and to nongovernmental agencies (market organizations or NGOs). Through contracts, public-private partnerships, or networking these agencies are becoming involved in policy-making. The new public management movement is an example of the "variety of "governance" approaches to public administration" (Torfing et al. 2012, 40–42).

***The second approach*** defines governance as a process of bargaining with different institutional levels of decision-making (local, regional, national, supranational, and global). This approach was developed in *Urban Politics Studies* and is connected with the process of decentralization and can be called ***multilevel governance***. In the literature, this precise concept is used with an adjective – decentralizing governance (Cheema and Rondinelli 2007). The multilevel character of governance first means that cities have to establish dialogue with higher regional and state authorities to solve specific municipal issues, then was used to explain relations between diverse levels of government in such supra-national institutions like EU. This understanding of governance means not only "vertical" interactions between governmental institutions of diverse levels (local, regional, national, supra-national), but also "horizontal" relations of government with other nongovernmental actors (businesses, corporations, NGOs, civil associations, etc.) to increase the efficiency of policy-making (Torfing et al. 2012).

***The next approach*** has close ties with the multilevel governance approach as it is rethinking governance in the context of decentralization and democratization processes and figure out such dimension of governance as multilateralism. ***Multilateral governance*** is a process of interaction between governmental and nongovernmental actors "in order to formulate, promote, and achieve common objectives by means of mobilizing, exchanging, and deploying a range of ideas, rules, and resources" (Torfing et al. 2012, 15). The concept of governance within this tradition is used in *International Relations studies* (IR) and *Economics*. Interactive Governance and Democratic Governance are the concepts "with adjectives" which establish a more precise understanding of this aspect of the concept of governance.

Study of governance in *IR* developed differently than in Developmental studies, Legal theory,

or Urban studies because of the specificity of international relations, when there is no hierarchy between states, and there is no "global government" that rules despite conspiracy theorists. That is why governance in IR was developed as "governance without government" (Torfing et al. 2012, 35–36), where at least formally equal states have to negotiate and agree about the ways to solve global problems (such as global security, poverty, climate change). Main mechanisms in global policy-making are soft power instruments, as the use of force and coercion is restricted or directly prohibited by international law. Globalization strengthens the role of global nonstate actors (e.g., global NGOs, global corporations, global media) that have become an integral part of the modern policy-making processes on an international level. The idea of the interaction among all these actors appeared and dominated the conceptualization of governance, which was documented by such concepts as global governance. The last conception is very close to "interactive governance" as a process of the interaction of governmental and nongovernmental actors to reach public goals and "multilateral governance" (or multilateralism) that has become a key feature for this approach to define governance (Torfing et al. 2012, 35–36).

*In Economics* an important discovery was made by Elinor Ostrom (1990; Ostrom et al. 1992) that institutions (rules and procedures) for governing the limited resources or commons (such as oil, joint grazing areas, and water for irrigation that are limited and easily exhausted) "are argued to emerge from voluntary cooperation without the use of formal governmental interventions from the public sector" (Torfing et al. 2012, 40–42). This discovery is very close to the idea of "governance without government" in IR.

Finally, a ***new approach*** to governance conceptualizes it as a more impartial, more reflexive, and more responsive process based on ***effective participation*** of government, private, collective and public actors, and learning operations that allow citizens to act collectively, redefine public interest, and reach public good more effectively. This approach is summarized using the concept of governance in contemporary political philosophy, which can be seen in producing new concepts "with adjectives" – "reflexive governance" (Lenoble and Maesschalck 2010), "governance of the common ground" (Stivers 2008), or "governance from the ground up" (Stivers 2008).

The conclusion from this brief analysis of theories of governance and the state is that the position of the state and government with appearance of new theories over time being rethought from state-centric understandings, where the state has a monopoly in policy-making (the historical approach to stateness) towards more state-limited conceptions, where the state is limited by the effective implementation of their functions or by some principles of "good governance" or by "vertical" and "horizontal" governmental or public control (functional and synthetic approaches to stateness and state-limited and multilevel governance), and finally to an understanding that state is important but only one of many other significant actors, and only their interaction and participation can effectively solve collective problems (sociocultural approach to stateness and multilateral and participatory governance traditions).

## But Why Has This Shift of Meanings of the Concepts of State and Governance Happened?

This happened due to **several processes** over the last three decades: globalization and the New Public Management (NPM) movement of the 1990s, which can be put in the broader processes of the Neoliberal movement in economics and politics starting from 1980s (Harvey 2005) and also because of decentralization and increasing participation in policy-making.

The advocates of ***new public management*** argued that "governments should 'steer rather than row' and oversee service provision rather than deliver it directly; further, governments should encourage local groups to solve their own problems by deregulating and privatizing those activities that could be carried out by the private sector or by civil society organizations more efficiently or effectively than by public agencies" (Cheema and Rondinelli 2007, 4).

***Decentralization*** in the 1970s and 1980s was understudied as the deconcentration, devolution

and delegation of authority, responsibility, recourses, and functions within government (e.g., from national to supranational (regional) and local authorities); in the mid-1980s the power of policy-making was actively shared with the private sector; during the 1990s decentralization became very close to democratization as it "was seen as a way of opening governance to wider public participation through organizations of civil society" (Cheema and Rondinelli 2007, 2–3).

Moreover, in the literature we can find the argument that the ***democratization*** processes within governance developed through the shifting from empowerment of nongovernmental actors by the state to the construction of equal partnerships between government and civil society actors to improve public policy (Stivers 2008, 115).

That is why the evolution of governance as a concept connected with a rethinking of the term and the development of ***participation***. Previous conceptions of governance (especially within NPM framework) proceed from the "transformation of citizen to customer," new concepts of governance deny this "economic thinking" and return us to "citizen thinking" on governance, which puts citizens into the core of policy-making. Participation of nongovernmental actors in governance should be not on the basis of public contract but through the creation of "common ground" between government and nongovernmental actors (Stivers 2008, 106). To do so another quality of participation in policy-making in needed. Not simple involvement (inclusion) and participation in governance lead to the "unconscious repetition" of old patterns and practices and does not allow real private, collective, and public interests to be identified, and finally prevent the finding of optimal solutions to public problems in public interest. What is needed is "reflective participation" based on learning operations that "puts forward an epistemological shift from one type of attention, a rational attention focused on actors' 'ability-to-do', to another type of attention, focused on actors' 'collective identity making'" (Lenoble and Maesschalck 2010, 15). In other words participation has to start, first, with "public building" (Stivers 2008, 115), which is the process of building a common identity of the participants of the policy process, when they agree about common values, goals, and interests. An integral part of this common identity is agreement about common democratic ideals and practices. Common identity became the ground for any further collective actions. Public-building and collective actions are repeated activities as through this repetition public learning and knowledge accumulation by participants about policy-making takes place. Participation through reflection on participants' identity, mission, and results of collective actions brings a new level of understanding of governance.

G

## The Practice of Measurement of the Governance and the State Capacity: "State-Centric" Biases of International Comparators

International comparators that produce indices of stateness and governance are using only some of the theoretical approaches and traditions which were described above (see Tables 1 and 2).

Within the "historical approach" to define state capacity, the Stateness Index was developed by specialists of Moscow State Institute of International Relations (MGIMO-University) and published in 2007 (Melville 2009). This index covered 192 states. Stateness is defined as the "state's capacity to maintain its existence, sustain its independent development, and deal with domestic and external problems, that is, to exercise the prerogatives of a sovereign" (Melville 2009, 53).

The "functional approach" to the conceptualization of stateness is represented by Stateness Combined Index by Bartolini (Cheema and Rondinelli 2007, 318). Within this approach we can find other indices: e.g., State Fragility Index and State Failure Index developed by the Center for Systemic Peace (2014), Government Effectiveness Index of World Bank (World Bank 2016b), Functioning of Government Index of Freedom House (Freedom House 2016).

We already know how Bartolini define stateness. As for the State Fragility Index – stateness or more precisely "a country's fragility is closely associated with its state capacity to

**Governance and the State: Theory and Russian Specifics, Table 1** Stateness indices and corresponding approaches to stateness conceptualization

| | Approaches | | | |
|---|---|---|---|---|
| Associated meanings or dimensions | Historical | Functional | Sociocultural | Generic or synthetic |
| Being independent and autonomous from other actors; primacy, autonomy, and sovereignty of the state | Yes | | | Yes |
| Capacity to perform governmental functions, establish effective structures, and concentrate recourses (or capitals) for state-agency activities | | Yes | | Yes |
| Citizens' identification with the state, problems with national and civil identity within state | | | Yes | Yes |
| EXAMPLES OF AUTHORS | M. Weber. Ch. Tilly | P. Bourdieu S. Bartolini | J. Linz, A. Stepan | M.Il'in |
| EXAMPLES OF INDEXES | **The Stateness Index** (MGIMO) | **Stateness Combined Index** (S. Bartolini), **State Fragility Index**, State Failure Index (Polity IV Project), Government Effectiveness Index (World Bank), Functioning of Government Index (Freedom House) | – | **Stateness Index (Bertelsmann Stiftung)** |

manage conflict; make and implement public policy; and deliver essential services and its systemic resilience in maintaining system coherence, cohesion, and quality of life; responding effectively to challenges and crises, and sustaining progressive development" (Marshall and Elzinga-Marshall 2015, 7).

The next indices – State Failure Index, Government Effectiveness Index, and Functioning of Government Index – do not precisely measure stateness. The State Failure Index measures such specific aspects of stateness such as political instability (ethnic war, revolutionary war, adverse regime change, and genocide/politicide). Government Effectiveness Index and Functioning of Government Index mix performance of governmental functions parameters with governance indicators. Also, the latest index, strictly speaking, was developed for the measurement of democracy and used as a subindex for the Freedom House index of democracy (Freedom House 2016).

The Stateness Index of Bertelsmann Stiftung is trying to measure stateness in the Generic or Synthetic tradition to conceptualize stateness (Bertelsmann Stiftung 2016a). Stateness here is "examined through questions specifically dealing with the state's monopoly on the use of force and basic administrative structures" (Bertelsmann Stiftung 2016b) and also with the legitimacy of citizenship and the acceptance of the nation-state.

International comparators do not work within the "Socio-Cultural Approach" to define stateness. The Bertelsmann Stiftung as one of four indicators of stateness uses "state identity" by asking the experts: "To what extent do all relevant groups in society agree about citizenship and accept the nation-state as legitimate?" But this is not the same as what Stepan and Linz mean, when they established their "stateness problem" as an "identity crisis" at a personal level with nation-state and when a citizen has a problem identifying him/herself with the nation and chose other forms of identity (global, local, etc.).

**Governance and the State: Theory and Russian Specifics, Table 2** Governance indices and corresponding approaches to governance conceptualization

| | Approaches | | | |
|---|---|---|---|---|
| Associated meanings or dimensions | State-limited governance | Multilevel governance | Multilateral governance | Participatory governance |
| Steering society and economy using soft regulation on the basis of accountability, transparency, client orientation, reduction of corruption, and rule of law | Yes | Yes | Yes | |
| Bargaining with different institutional levels of decision-making (national, supranational, regional, local, and global) | | Yes | Yes | |
| Interaction between governmental and nongovernmental actors | | | Yes | Yes |
| Reflexive participation of government, private, collective, and public actors through learning operations | | | | Yes |
| EXAMPLES OF CONCEPTS "WITH ADJECTIVES" | Good governance, rule-based governance, regulatory governance | Decentralizing governance | Global governance, interactive governance, democratic governance | Reflexive governance, governance of the common ground, governance from the ground up |
| EXAMPLES OF DISCIPLINES | Developmental studies, legal theory, public administration | EU studies, urban politics studies | IR studies, economics, urban politics studies | Political philosophy |
| EXAMPLES OF PROCESSES | NPM movement | Decentralization | Decentralization, democratization | Democratization in advanced countries |
| EXAMPLES OF INDEXES | Functioning of Government Index (FH), Index of African Governance (World Peace Foundation), property rights and rule-based governance, index of objective indicators of good governance, governance indicators (WB) | – | Management Index (Bertelsmann Stiftung) | – |

Indices of the governance can be associated with only two out of four approaches to define governance (see Table 2).

The most popular for international comparators (or agencies that make indices to compare countries on different societal parameters of development) is the "state-limited governance" approach, within which a lot of governance indices are made: Functioning of Government Index (Freedom House, FH), Property Rights and Rule-

based Governance (World Bank, WB), Index of African Governance (World Peace Foundation), Index of Objective Indicators of Good Governance (WB), Governance Indicators (WB).

The most popular governance comparator – the World Bank – defines governance as "the process by which governments are selected, monitored and replaced; the capacity of the government to effectively formulate and implement sound policies; and the respect of citizens and the state for the institutions that govern economic and social interactions among them" (World Bank 2016b). The Worldwide Governance Indicators (WGI) project measures six dimensions of governance: Voice and Accountability, Political Stability and Absence of Violence, Government Effectiveness, Regulatory Quality, Rule of Law and Control of Corruption – and does not aggregate it in an averaging index.

Also the World Bank assesses indices of Property Rights and Rule-based Governance – "the extent to which private economic activity is facilitated by an effective legal system and rule-based governance structure in which property and contract rights are reliably respected and enforced" (Teorell et al. 2016, 387). The three dimensions of this type of governance are: "(a) legal basis for secure property and contract rights; (b) predictability, transparency, and impartiality of laws and regulations affecting economic activity, and their enforcement by the legal and judicial system; and (c) crime and violence as an impediment to economic activity" (Teorell et al. 2016, 387).

Index of Objective Indicators of Good Governance by the World Bank (Knack and Kugler 2002) consists of nine indicators: "the regulation of entry, contract enforcement, contract intensive money, international trade tax revenue, budgetary volatility, revenue source volatility, telephone wait times, telephone faults, and the percentage of revenues paid to public officials in bribes, as reported in surveys of business firms" (Teorell et al. 2011, 85).

Index of African Governance by the World Peace Foundation (Rotberg and Gisselquist 2009) defines governance very broadly but still puts the state and its responsibility to provide and deliver political, social, and economic goods and services for citizens in the center. This index is based on five subindicators: "safety and security; rule of law, transparency and corruption; participation and human rights, sustainable economic opportunity; human development" (Teorell et al. 2016, 347).

Index of Functioning of Government by Freedom House examines to "what extent the freely elected head of government and a national legislative representative determine the policies of the government; if the government is free from pervasive corruption; and if the government is accountable to the electorate between elections and operates with openness and transparency" (Teorell et al. 2016, 275).

"Multilateral governance" could be illustrated by Management Index by Bertelsmann Stiftung and consist of five criteria: level of difficulty – structural difficulties (such as poverty, disasters, pandemics), civil society traditions, and social, ethnic, and religious conflicts intensity; steering capability – "the government manages reforms effectively and can achieve its policy priorities"; resource efficiency – "the government makes optimum use of available resources"; consensus-building – "the political leadership establishes a broad consensus on reform with other actors in society, without sacrificing its reform goals"; international cooperation – "the political leadership is willing and able to cooperate with external supporters and organizations" (Donner et al. 2016).

International comparators do not conduct any rankings to evaluate countries' success or failure in establishing multilevel and\or participatory governance.

## Russian Specifics: Failures of "State-Centric" Approach in Practical Policy-Making

According to the main indices of stateness provided by international comparators, Russia has good and moderate positions. For comparison we took the three main indices that measure stateness directly (The Stateness Combined

**Governance and the State: Theory and Russian Specifics, Table 3** Positions of Russia in international indices of stateness

| | The Stateness Index (Melville 2009) | | The State Fragility Index (Center for Systemic Peace 2014) | | The Stateness Index (Bertelsmann Stiftung 2016a) | |
|---|---|---|---|---|---|---|
| | Rank | Decile[a] | Rank | Decile[a] | Rank | Decile[a] |
| Russia | 27 (192) | 2 | 91–102 (167) | 6 | 43–47 (129) | 4 |
| Brazil | **9 (192)** | **1** | 59–67 (167) | 4 | 38–42 (129) | 3 |
| India | 81 (192) | 5 | 118–130 (167) | 8 | 62–75 (129) | 5 |
| China | **12 (192)** | **1** | 68–75 (167) | 5 | 28–31 (129) | 2 |
| South Africa | 30 (192) | 2 | 86–90 (167) | 6 | 48–61 (129) | 4 |
| USA | **1 (192)** | **1** | 42–50 (167) | 3 | – | – |
| Norway | 31 (192) | 2 | 29–41 (167) | 2 | – | – |
| Poland | 32 (192) | 2 | **1–22 (167)** | **1** | **7–10 (129)** | **1** |

[a]Country got 1st position, if less than 10% of states have the same position; 2nd – less than 20%, 3rd – less than 30%; etc.

Index by Bartolini measured the stateness directly but was not included here as limit its "sample" only by Western European states.) (the Stateness Index by MGIMO, the State Fragility Index by the Center for Systemic Peace, and the Stateness Index by Bertelsmann Stiftung) and compared Russia with seven countries (other BRICS countries: Brazil, India, China, and South Africa; the USA, because Russia always was challenging US ambitions as superpower; Norway, like Russia, one of the largest producer of oil and gas in Europe; Poland, like Russia, one of the post-communist bloc country) (see Table 3).

The highest position Russia takes on the Stateness Index (7.5 points out of 10 and 27th place out of 192 countries), which put it in the top quintile.

Russia has more moderate positions according to the State Fragility Index. Here Russia got 9 points out of 25, where ranges differ from 0 "no fragility" to 25 "extreme fragility." The State Fragility Index provides its rankings in dynamics: Russia little improves its state capacity from 10 points in 1995 to 9 in 2015 but not significantly. Russia shares 91–102 rank with other 12 countries and belongs to the top 60% of countries in the world, like South Africa, and enjoys a better position than India.

The Stateness Index by Bertelsmann Stiftung has fewer countries in its sample (it excludes "developed countries" like the USA and Western European states). Russia here is in the top 40% of countries, like South Africa, ahead of India, and behind Brazil, China, and Poland. The stateness of Russia in the Bertelsmann Stiftung interpretation did not change significantly (index value changed from 7.5 out of 10.0 in 2006 to 8.0 in 2016).

From these indices of international comparators we can conclude that Russia is independent enough from other actors, enjoys its primacy, autonomy, and sovereignty; has moderate problems with state capacity to perform governmental functions; but in general has a stable place in first 40% of "developing countries."

However, political scientists and public policy analysts highlight that the main problem of policy-making in Russia is its reduction to the distribution of social benefits obtained from the high revenues from oil and gas sales. Serious social reforms cannot be properly contested and deliberated by different political actors and stakeholders; policy options and tools became the product of backstage coordination within a closed system of high-level federal bureaucracy. Therefore, any social reforms beyond distributive policy are faced with public protests or sabotage by local elites or stakeholders, who were excluded from the policy-making process. In case of sabotage, the policy change remains on paper and is never implemented. The main style of policy implementation when protests arise is "manual government": "direct and personal intervention from the highest levels in order to respond effectively" and "constant manual control by top leaders" is required. "This is because the increasingly centralized system gives very little incentive

**Governance and the State: Theory and Russian Specifics, Fig. 1** How proud are you of your nationality? (% of respondents said "very proud"). (Source: World Value Survey 2016)

for lower levels of government [and to other policy actors] to try something new and, more importantly, gives them little real authority to do so – even when it comes to resolving local problems" (Petrov et al. 2010, 22–23). Examples of such "manual government" are the cash-for-benefits reforms in 2005, policy of banning all right-hand-drive cars in Russia in 2005–2006, and restrictions on housing policy in 2006 (Greene 2014).

Moreover, the analysis of stateness using the "sociocultural tradition" gives us more insights to the main "stateness problem" for Russia: the lack of citizen identification with the nation-state. Because international comparators do not work within the "sociocultural tradition," we used as a proxy-parameter the perceptions of national pride to illustrate this problem (see Fig. 1).

Less than one third of Russians are very proud of their nationality, and this has not changed significantly over time (only in 2006, 45% of Russians were very proud of their nationality). In other countries (India, South Africa, Poland, the USA) majority of the population are "very proud" of their nationality. Together with Russia other leaders of "state consistency" rankings Brazil and China have problems with "national identity." For Brazil it can be temporary phenomenon, as in 1991 the majority (64%) of Brazilians were "very proud" of their nationality; for two authoritarian polities with the elements of former empires – China and Russia – this problem is more persistent.

About 20% of Russians would like to emigrate outside the former USSR for permanent residence (Levada center 2016). The number of potential emigrants has the tendency to grow, as in 1990 only 11% wanted to do so. Willingness to emigrate is declared more by the youth (18–24 years old) and respondents with higher education (Levada center 2015).

Therefore, we can conclude that international indices do not show the real contemporary problems of stateness, because they still work in a "state-centric" paradigm to measure stateness and do not capture such important questions as

**Governance and the State: Theory and Russian Specifics, Table 4** Positions of Russia in international indices of governance

| | Functioning of Government Index (Freedom House 2016) | | Governance Indicators (World Bank 2016b)[b] | | Management Index (Bertelsmann Stiftung 2016a) | |
|---|---|---|---|---|---|---|
| | Rank | Decile[a] | Rank | Decile[a] | Rank | Decile[a] |
| Russia | 141–159 (195) | 8 | 157 (202) | 8 | 114 (129) | 9 |
| Brazil | 71–84 (195) | 4 | 99 (202) | 5 | 14 (129) | 2 |
| India | 56–70 (195) | 3 | 104 (202) | 6 | 24 (129) | 2 |
| China | 160–170 (195) | 9 | 130 (202) | 7 | 74 (129) | 6 |
| South Africa | 71–84 (195) | 4 | 76 (202) | 4 | 27 (129) | 3 |
| USA | 31–55 (195) | 2 | 24 (202) | 2 | – | – |
| Norway | **1–19 (195)** | **1** | **3 (202)** | **1** | – | – |

G

citizen identity with the state, including "national identity." The "state-centric" approach to policy-making can lead to state failures, if it ignores the "sociocultural" dimension of stateness and state-building.

To illustrate Russian specifics with governance we took three indices that provide indices for all or the majority of the countries (Index of African Governance by World Peace Foundation is made for 53 Africa's countries; Property Rights and Rule-based Governance by World Bank is made for 80 countries, mostly of African continent; Index of Objective Indicators of Good Governance by World Bank was made only in 2002 (Knack and Kugler 2002)) (Table 4).

Russia has low positons according to all three indices of governance. The situation for Russia is worsening if we move from "government-based" definitions of governance towards more "polycentric" conceptions, which is trying to measure not only government success in public administration but also democratic governance and non-governmental actors involvement in the policy-making process.

Functioning of Government Index by Freedom House gives to Russia three points out of 12 (where 0 is the worst performance of government and 12 is the best). The position of Russia in this ranking has not changed during the last 10 years.

According to the Governance Indicators, ranging from −2.5 (weak) to 2.5 (strong) for governance performances, World Bank assesses Voice and Accountability in Russia at −1.07 points; Political Stability and Absence of Violence/Terrorism −1.05 points; Government Effectiveness −0.18 points, Regulatory Quality −0.52 points; Rule of Law −0.72 points; Control of Corruption −0.86 points. The average of all six indicators is −0.73 points. During the last 10 years of observations this assessment does not change significantly, except for a decrease in Voice and Accountability, which "reflects perceptions of the extent to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media" (World Bank 2016b).

During the 10 years of observation the Management Index of Bertelsmann Stiftung for Russia decreased from 3.86 to 3.17 (out of 10); in 2006 it was 87 out of 129 developing countries (BTI in its rankings does not include "developed countries" of North America, Western Europe, Australia, etc.), and in 2016 Russia was in 114 place. Negative changes occurred in all five categories of the management index, except recourse efficiency, which stays the same. If we look into subcategories we see that most of all, the quality of management in Russia suffered due to the decrease in the assessments of Civil society traditions, GNI per capita, government policy learning capability, the ability of reformers to overcome the antidemocratic veto actors, civil society

participation, effective use of international support, and credibility of the government in relations with international community. These subcategories, except civil society traditions and policy learning capability in 2016 get the lowest grades (1 and 2 out of 10). The majority of them related to a multilevel and multilateral understanding of governance.

The Russian political leadership recently lost control over such antidemocratic actors as the Russian Orthodox Church, whose influence on policy-making became more and more significant (e.g., Church supports Russian "anti-gay legislature," introducing religious studies at schools) (Soroka 2016); some governors of Russian regions (e.g., Ramzan Kadyrov, the head of the Chechnya) pursue a policy of violating human rights in the region and became known for their extremist statements in relation to the political opposition (Dubnov 2016); oligarchs – high state officials, who control big state corporations, and businessmen, who had friendly relations with high state officials – enjoy privileges and profits due to their close ties with power (Kolesnikov 2015); governmental nongovernmental organizations, GONGO (such as the "Night Wolves" movement, which is financed by the government to conduct "patriotic" public campaigns sometimes using violence against political opposition). Civil society participation become more and more restricted, for example, by implementing draconian legislation towards NGOs independent from government (such as "foreign agent law" and "antiextremist laws" that are used to close independent NGOs and abuse opposition activists) (Greene 2014). After the annexation of the Crimea by Russia and the armed conflict in Eastern Ukraine, where Russian troops were involved, and the sanctions imposed by the USA and EU against Russian policy in Ukraine, Russia as an international partner is not considered credible and reliable. In Russia any hint of agreement with "Western countries" or disagreement with official state positions on the burning political issues (such as the Ukrainian crisis, repressions of political opposition, election results) will automatically make you a "foreign agent" and an "enemy of the state," which are becoming synonymous.

As we can see from this brief analysis of the Russian specifics of governance, the problem to raise its effectiveness is on the level of democratization. The problem also is that we have no instrument to measure a country's success in the introduction and development of the advanced version of governance – participatory governance – which has become an empirical fact in "embedded democracies" and increasingly demanded by public in "developing countries." What we have is different indices of democracy, where Russia has very modest positions (Russian politics in the last 25 years has changed considerably. Political regime in Russia is called differently "partly free" (1991–2003) and "not free" (2004–2015) (Freedom House 2016); "open anocracy" or "hybrid regime" (1992–1999 and 2007–2015) and even "democracy" (2000–2006) – Polity IV project (Center for Systemic Peace 2014); "hybrid regime" (2006–2010) and "authoritarian regime" (2011–2015) (Economist 2015); "defective" "nonliberal" democracy in relation to the presidency of Boris Yeltsin (Merkel and Croissant 2002) and "plebiscite bureaucratic regime" in relation to the presidency of Vladimir Putin (Holodkovsky 2009). Nevertheless, common place is that the Russian political regime has highly personalized nature and political dynamics of the last 25 years was towards the strengthening of authoritarian tendencies.), and sociological surveys, based on which we can conclude that even Russian citizens are very skeptical about the level of democratic governance in their own country (see Fig. 2).

Compared with BRICS countries, the USA, and Poland, Russia is assessed as the least democratically governed country. Next to Russia to the level of public skepticism about democratic governance performance in the country is Brazil. Here, they have similar rankings as they did in their level of national pride. Thus, we can assume that both countries have a "stateness problem" and a democratic governance performance problem. Surprisingly, China appeared in the cluster of countries, where citizens are more satisfied with

**Governance and the State: Theory and Russian Specifics, Fig. 2** How democratically is this country being governed today? (1 – "Not at all democratic," 10 – "Completely democratic," % of respondents). (Source: World Value Survey 2016)

democratic governance performance. Because China in the democracy rankings is considered an authoritarian country, as is Russia, we can assume that Chinese citizens are just more optimistic about their governance. This puzzle also proves that we need more instruments to measure such new forms of governance as democratic and participatory governance.

## Conclusion

The main watershed between the different traditions of the conceptualization of stateness is between the "old" ("historical" and "functional" approaches to define stateness) and the "new" ("sociocultural" approach). The "old" tradition pays attention to such dimension of stateness as autonomy of government (from other states and international actors or from actors within state through effectively providing governmental functions). This tradition goes back to the notion of sovereignty. The "new" tradition concentrates on such dimensions of stateness as the identification of the citizens with the state (through participation in the political process, nation- and state-building). Therefore, this tradition works with and is based on such notions as, first of all, "identity," "nation," and "democracy."

International comparators mostly work within the "old" tradition and prefer "historical," "functional," or "synthetic" approaches to define stateness, which is reflected in the domination of this discourse in stateness studies. Alternative discourse and research program for stateness studies should be developed within the "new" tradition or the "sociocultural approach" to define stateness.

To develop it there are some limitations or conceptualization problems. First is the under-theorized (or under-conceptualized) position of stateness as a concept including its positioning

around such notions as identity, democracy, and nation. Second is the under-operationalized character of the concept of "stateness as identity," that means few attempts were made to understand and calculate the parameters and terms which could help to describe "stateness as identity" that will help to switch from parameters to measurable indicators.

For the concept of governance, the line of demarcation lies between the "government-centric" tradition to define governance (state-limited, multilevel, and multilateral governance approaches) and the "participatory governance" approach.

The first tradition gives the government a central role in governance through *steering society and economy using soft regulation on the basis of accountability, transparency, client orientation, reduction of corruption, and rule of law*, despite some upgrade of the concept through adding such dimensions of governance as *bargaining with different institutional levels of decision-making (local, regional, national, supranational, and global)* and *interaction between governmental and nongovernmental actors*.

The second tradition pays attention to learning operations and knowledge as core elements of governance and participation based on knowledge of government, private, collective, and public actors. The key idea here is that knowledge in contemporary societal systems could not be monopolized by one actor (government, business, or civil) – everybody has knowledge, and the one of the main purpose of governance is to actualize this knowledge for decision-making.

The first tradition is dominated in discourse about governance. International comparators work only within this paradigm. The limitations and conceptualization problems, the under-theorized, or under-conceptualized, and under-operationalized character of governance as *reflexive participation of government, private, collective, and public actors through learning operations* can be fixed.

Therefore, governance practices of some states (as we illustrated in the Russian example) and governance instruments (such as indices of international comparators) have not kept in step with recent developments in the theory of state and governance and with the demands of civil society and different publics for more responsive and participatory governance. State and government are no more the centers of the policy-making universe.

# Governance and Trust

Adila Reza Hasan
Department of Public Administration,
University of Dhaka, Dhaka, Bangladesh

## Synonyms

Administration; Citizen-government relationship; Governance capital; Public commitment; Regulatory institutions; Social capital

## Definition

Governance and trust refers to the civic trust on the government's implementation of public affairs including policy formulation and execution.

## Introduction

Trust in governance is crucial to manage future change and to engineer innovations and reforms that help citizens to get access to reliable and quality public services and also facilitate subjective well-being. The government cannot meet the future challenges if there exist "trust deficit" so it is important to restore trust in governance. Researches on cross- and within country exhibits individual and organizational specific determinants of trusts. Numerical studies found that trust is associated with religiosity, education, demography, accessibility of public services, institutional quality, and involvement in political-democratic system. Moreover several studies expressed that trust in government is linked with citizen's assessment of government performance. In different literatures multifaceted definitions and determinants of trust have been developed.

The purpose of this entry is to provide a succinct overview of trust and governance as these two are inextricably linked and are crucial to explain citizen's satisfaction with political-administrative system and nongovernment institutions and services. It begins with an introduction which demonstrates a brief introductory notes on the topic. It then provides a concise literature review on governance and trust. It then turns to overview the interface between leadership, change, and trust and with trust and governance. Furthermore, it provides an overview of the reasons and consequences of decline of trust from a public sector perspective. Finally the entry is enclosed with a conclusion.

## Governance and Trust: Conceptual Framework

### Governance

There have been numerous attempts to define the term governance by scholars and international donors. As a result multifaceted definitions of governance have emerged with different connotations. Governance is not synonymous to government. Government is an organization and governance is about implementation of nation affairs and management of social and economic issues. Governance is a process of coordinating and integrating multifaceted actors and institutions to discourse, determine, and accomplish policy goals in a complex political realm. Governance is the government's ability to formulate and reinforce law and distribute public services regardless of the democratic or undemocratic nature of the government (Fukuyama 2013). Fukuyama (2013) identified four comprehensive approaches to evaluate quality of governance: *procedural measures* (evaluation of recruitment and promotion processes, technical expertise, and overall formalism in bureaucratic procedures), *input or capacity measures* (measuring degree of professionalization in bureaucracy), *output measures* (measuring the quality of output of the government services), *and measures of bureaucratic autonomy* (assessing the degree of political influence in bureaucracy or degree to which bureaucrats are unconstrained by political mandates).

The United Nations Development Programme (UNDP 1997) define governance as social, political, and administrative authority to run the state. According to the World Bank (1994) there are three facets of governance: (1) nature of political

regime, (2) use of power in the management of a country's economic and social resources for advancement, and (3) ability of government to plan, formulate, and execute public policies and nation affairs. The definition of UNDP coincides with World Bank's definition as both give importance to the role of political actors in the process. Governance involves power and authority relationships through which government officials are held accountable for their actions by the stakeholders. With time the term governance has been expanded to corporate governance, global governance, local governance, institutional governance, project governance, environmental governance, and so on. Scholars have defined governance as *hard (formal and structural aspect*) and *soft (behavioral and relational aspect)*. In short, governance encompasses processes, mechanisms, norms, values, and institutions through which the citizens can formally and informally arbitrate their conflicts or disagreement, divulge their interests, and exert their legal rights.

The legitimacy and credibility of the government can be achieved through effective and accountable institution, democratic representation, and fair electoral process and responsive governance structures. Governance can be determined from different modes such as governance as network (governance through actors involved in policy web, i.e., collaboration or partnership), governance as structure (governance through political and economic institutions), governance as market (governance through empowering economic actors, i.e., buyer-supplier transaction), and governance as hierarchies (governance through top-down steering state structures, i.e., bureaucratic organization). The failure of government resulted from failure in governance process, i.e., *knowledge problems* (lack of insights)*, implementation problems* (lack of efficacy), *capability problems* (lack of mechanisms), and *motivation problems* (lack of compliance) (Dixon and Dogan 2002).

## Trust

Many scholars have expressed that trust is difficult to define as it is context or situation specific; besides there is absence of universal applicability of the definition of trust. Citizen's trust in the government may vary due to ideological differences and stereotypical and generic images. However, trust can be defined as reciprocal relationship based on mutual cooperation and commonly shared norms and expectations that others will restrain from securing personal advantage and will act efficiently and equitably. Kramer (1999) defined trust as *choice behavior* (individual decisions to make rational, calculative, or relational choices) and *psychological state* (perceptual or attitudinal view on trust). In a nutshell trust is the expectations, beliefs, and assumptions of other people who are embedded in the social system to act fairly without being detrimental to one's interest. The common characteristics of trust found in different literatures are *vulnerability*, *risk-taking*, and *expectations.*

According to Mayer et al. (1995: 712), trust is "willingness of a party to be vulnerable to the actions of another party based on the expectation that the other will perform a particular action important to the trustor, irrespective of the ability to monitor or control that other party." Moreover, in the opinion of Mayer et al. (1995), there are three antecedent factors that determine trustee's trustworthiness, i.e., *ability* (expertise needed to perform a job), *benevolence* (positive relationship based on selflessness and loyalty), and *integrity* (adherence to sound ethical and moral principles). Thus, it can be concluded that trust in the government depends on the level of integrity and benevolence attitudes of the elected and non-elected actors as well as their ability to effectively implement public policies and programs.

Hoy and Moran (1999) in their empirical study identified five faces of trust: willingness to take risks, benevolence, reliability, competence, honesty, and openness. This study is similar to the study done by Mayer et al. (1995) which identified three antecedent factors of trust where "integrity" is related with "honesty" and "ability" is related with "competence." Barney and Hansen (1994, cited in Blomqvist 1997) identified three scales for measuring trustworthiness: *weak-form trust* (found in competitive commodity market where low scope for opportunism and no liabilities exist*), semi-strong-form trust* (parties behave non-opportunistically in fear of losing reputation),

and *strong-form trust* (internalized values, principles, and behavioral standards of the parties which neutralize opportunism). According to OECD (2017) there are two dimensions of trust: *cognitive trust (national or experience-based trust) and affective trust (emotional trust).*

Most of the public administration literatures are predominantly based on citizen trust in public sectors or government administrators. Scholars have identified three forms of trust: *interpersonal* (trust in colleagues, leader, supervisors, etc.), *organizational* (individual trust in workplace), and *institutional* (individual trust in institutions like police, parliament, etc.). Many empirical surveys have examined the influence of trust in public or private organizations and institutions like school, parliament, police, health, and hospitals (Holmberg et al. 2017; Boateng 2012; Zayim and Kondakci 2015; Platt et al. 2017). Trust is important when complexity, uncertainty, and risks surface in governance and governance networks. Trust stimulates learning and also reduces uncertainty by enabling innovation, knowledge transfer, and information sharing among the actors.

## Leadership, Change, and Trust Interface

Empirical studies exhibit that there is positive correlation between leadership style and trust in the leader. People who perceive their leader as effective, trustworthy, empowering, participative, and supportive will feel valued and show more willingness to support change. Transformational leadership facilitates trust building; stimulates learning, productivity, commitment, and morality of employees; and also inspires for goal accomplishment. Leader's integrity and ethical leadership are positively associated with trust in leader and employee engagement, performance, and growth. Ethical leadership can stimulate employee commitment and trust, thus fostering welfare and growth of the overall community (Bligh 2017; Engelbrecht and Mahembe 2017). Notwithstanding, leadership commitment regardless of style is crucial to drive the process of governance and trust, to create effective context for change, and to carry quality policy decision-making.

Scholars have expressed that there is a crucial role of trust in successful implementation of change strategies. Change is likely to be successful in the organization that exhibits values like trust and openness. Individuals show trust in management when treated fairly which reduces uncertainty and increases interpersonal relationship and commitment to change (Zayim and Kondakci 2015; Komodromos 2014). The success of any change efforts largely depends on the leader's ability to motivate employee by enhancing their capacity and to stimulate trustworthy climate to sustain support during transformation process. Leaders need to efficiently manage the human resource by focusing on subjective commitment, trust, participation, coalition, and empowerment for leading innovation in organization. Lack of leadership support can create distrust and unwillingness of employee to comply with change. The sustainability of trust is affected by strong control-oriented management system. Trust is a crucial factor between leader-follower relationships for successful implementation and management of change efforts. Leadership theories have identified three core bases of leader-member trust: *ability, benevolence*, and *integrity* (Bligh 2017).

## Governance and Trust: Interrelationship

Trust is related with the overall quality of governance and bureaucratic efficiency. Comprehensively, trust is a pervasive element across the governance system including policy making and policy implementation. Higher level of public trust in public organizations establishes good governance and effective execution of public policy. Trust is essential to minimize risks, complexities, and uncertainties as the public sector is gradually moving from traditional bureaucracy (stability) to new public governance with multiple actors involved in public service delivery and policymaking process (complexity) (Walle 2013; Dickenson 2016). Many literatures have studied trust from different dimensions of governance. According to Asadullah (2013), inadequate and substandard social and legal institutions are expected to impair institutional and social trust.

**Governance and Trust, Fig. 1** Six areas of government trust. (Source: OECD (2017) Trust in Government, OECD, France)

The individual's confidence on social and legal institutions is affected by the nature of political regime. OECD (2017) has identified six crucial areas to uphold trust in the government as shown in Fig. 1.

That is, openness and fairness in service delivery, law-making, policy, budgeting, and decision-making processes, integrity and sense of justice among public officials, reliable and transparent government, and citizen empowerment and engagement in all stages of political process and policy cycle are crucial elements to uphold trust in the government. The relationship of a citizen with the government should be based on trust not on contracts. Good public services system may not necessarily promote trust, but bad public services system certainly promotes distrust (Bouckaert 2012). Empirical study has found that there is a positive relationship between public service performance and trust in the government (Walle and Bouckaert 2003).

Distrust is the outcome of failure in governance, i.e., public policies are enforced without transparency and citizen engagement. Government needs to retain citizen trust consecutively, and the citizen needs to have trust and confidence in the government as public trust steers ethical decision-making and proper execution of government plans, programs, and projects. Contradictory results have been found in some empirical studies. Some studies demonstrate a negative correlation between trust and governance, while others report a positive correlation. According to Puranam and Vanneste (2009), trust enhances governance. In an empirical study conducted by Muller et al. (2014), it was revealed that high level of trust among project managers and teams is positively correlated with supportive governance structures (i.e., the structures that provide project managers and teams with authority to implement their own decisions).

## Reasons and Consequences of Decline of Trust in Governance: From a Public Sector's Perspective

Trust in government is an essential element of growth and performance. Public commitment and cooperation are a prerequisite for strengthening domestic tax mobilization, successful implementation of policies and programs, acceptance of judicial and legislative decisions, and achieving sustainable development. However, to accelerate public commitment and cooperation, there is a need for fair exchange of information; enhancing core governance systems in fields like public procurement and financial management; impartial and equitable distribution of public services; and effective evaluation of government performance. The root cause of mistrust resulted from unaccountable and unresponsive government, lack of citizen engagement, and lack of proper regulation. "Bureaucratic corruption, excessive red-tape, inefficient and ineffective delivery of public resources, wastage of public resources, poor leadership, lack of reform mind-sets, and lack of integrity in government" are the reasons for decline of trust in the government (Brillantes and Fernandez 2011).

The reason for decline of trust in the public sector are government fails to provide what they promise and the citizen's consideration of public administration as an inefficient institution to solve

**Governance and Trust, Fig. 2** Causes of public distrust. (Source: Adopted from Moon 2002)

contemporary problems of globalization. Empirical studies also found that the reason behind decline of trust are gap between expected economic and political performance outcome and actual performance outcome, erosion of institutional norms and ethics, rise in political scandals, filtering information by mass media, and dysfunctional political system. Public distrust is due to numerous reasons; however such distrust can be mediated if some affirmative measures are taken as shown in Fig. 2.

The widespread discontentment and lack of efficacy of the political process give rise to political cynicism and decline in trust. Public trust in the government is contrarily related with degree of citizen perception of corruption. Lack of trust is closely associated with corruption (Brillantes and Fernandez 2011). Low level of trust not only results in low level of loyalty in public sector, lack of willingness to comply with laws and regulations, and unwillingness to involve in the democratic process moreover, public sector are held in low esteem discouraging meritorious to join different governmental services. The key to development of high-level trust and improved performance is providing scope for civic participation in the decision-making process (Bligh 2017). Many public administration literatures have labeled low trust in public sector as "undesirable" and "problematic" as it deteriorates public service pride.

Trust in public officials is a manifestation of legitimacy and effectiveness of democratic regime and popular support (Jamil and Ashvik 2013). The stability of the political regime becomes questionable if there exist high-level distrust among citizens. According to social capital proponents, when governance actors build social trust, cooperation, networks, and civic norms, public policies can be effectively implemented, quality services can be rendered, and government reforms and innovations efforts will become more viable and acceptable. Nevertheless, such networks need to be built on non-opportunistic behavior of the political agents. In the opinion of Fukuyama (2013), trust can be restored by building social capital. Contrary, in some other studies scholars have found no empirical correlation between trust and social capital. This is because of complex dimension of trust and social capital; moreover, social capital may vary due to institutional, attitudinal, and socio-cultural differences. However, it can be concluded from different literatures that trust is embedded in social capital and inclusive and cooperative formal and informal social networks are crucial in generating social trust though several studies on interrelationship between trust and social capital from different contexts lead to confusion and differing perspectives.

In today's era of globalization, the public service ethos like trust and integrity is becoming obsolete and restoration of public trust has become imperative for quality governance and democratic stability. To restore trust and to build integrity in the system of governance, it is imperative to redesign public administration structures, procedures, and

processes by making it responsive and conclusive, people-centric, and value congruence. The two key elements to public trust are *competence* (ability of government to deliver quality services to the citizen) and *value* (principles that guide government action) (OECD 2017). Trust fosters well-functioning and performance-driven public sector which primarily leads to increased satisfaction among citizens.

## Conclusion

This entry has provided an overview of trust and governance and the role of trust in shaping public perception toward government functionaries. It began with a conceptual overview on governance focusing on different forms (soft and hard governance) and modes of governance such as governance as structure, governance as network, governance as market, and governance as hierarchies. In order to meet the complex governance challenges of the twenty-first century, the government needs to work collaboratively with citizens and communities in order to enhance participation, transparency, commitment, and trust.

Next the entry puts light on the conceptual formulation of trust by focusing on various scales, faces, forms, and antecedent factors of trust. The entry draws findings from different literatures which provide multifaceted definitions of trust and identify multiple faces and valid and reliable measure to trust. This provides a useful foundation to understand different trust-related factors in the governance.

This entry also discussed about the interface between leadership, trust, and change. Trust plays a crucial role in organizational change, and change management plans can fail if trust is not present. When a leader poses certain traits like integrity, benevolence, and competency, then the leader can drive transformation and can create value for change.

Moreover, the entry also presented an interrelationship between trust and governance. A number of factors can foster public trust in government: *equal and ethical treatment, good leadership, and management and quality services* (Eccles 2015). Public administrators need to follow a democratic approach while designing and implementing public policy and need to share power and listen to citizen's voices in order to win trust.

Finally, the entry provided a comprehensive reason for decline of trust in the public sector and its consequences. Trust is central in reconciling the tension between citizen and public administration created by complex governance structures. Understanding public trust will help leaders to identify the factors behind the crisis of trust in the whole governance system. A government needs both accountability and transparency to gain citizen's compliance and trust. The establishment of well-trusted public administration is imperative to meet citizen's expectation and to keep in pace with global trends.

## Definition

Urban regeneration refers to the extent to which a community's capacity matches the territory's conditions for reversing urban decline and aiming at an overall development of the community.

## Introduction

Urban regeneration has been fertile ground for the governance debate. Research on urban regeneration focuses on the degree to which a community individual's capacity matches the territory's conditions and resources existing in a specific environment, as well as the values (cultural, economic, and social) and the organizational system (based on formal and informal rules) that enable the adoption of regeneration schemes. A number of questions remain about the effectiveness of regeneration schemes whose attempt is to reverse any form of decline by both improving the physical structure and the economy of territorial areas.

How can top-down government programs gain the support and engagement of local people that is

usually crucial to their success? How can regeneration schemes prevent displacing problems from one area to another? Different types of urban regenerations explored in the literature include the focus on the approach which regulates the mechanisms lying at the basis of regeneration programs and which more adequately govern such complex processes of renewal and revitalization. That is governance.

The concept emerged in a specific historical context but is now utilized for a multitude of purposes. Scholarly attention to governance is relatively recent, with much of it emerging in the last two to three decades, and it stands as a paradigm shift in the public management realm. It can be described as a model whereby government, business, community groups, and citizens work together and leaders share power to reach collaborative consensus-based decisions. Governance has been subject of discussion in the literature, both at the theoretical and practical level, and as a theory has been revised and reassessed to explain new emerging governance systems and practices.

Nowadays, governance includes theoretical and practical methodological bases, which offer the promise of greater citizen participation and empowerment (Kooiman 2000, 2003), greater social capital and solutions to community problems, and a sharp shift from a centralized and technocratic decision-making to a distributed and participatory governance. It is from this standpoint that the politics of urban regeneration leading to development, although being a microcosm of the wider governance debate, finds its legitimization in the perspective of governance. Urban regeneration is usually consultative, and its successes or failures are inextricably connected to the governing models used for conducting practices of urban development. A notable argument here, which builds up on Rhodes' assumption (1996, 1997, 1999, 2000) that networks are high-trust mechanisms rooted in trust and subject to rules negotiated by network participants, is found in the work of Stoker (1998a). The latter provided his definition of governance, emphasizing the value of networks and partnerships in integrating individuals and other actors drawn from, but also beyond, the government into the decision-making.

The purpose of this entry is to provide a concise overview of what is the relation between governance and urban regeneration, more specifically, what is known about the politics of urban renewal/regeneration and the role that it has played in having shaped, as evidence shows, a sustainable future of entire communities by generating many positive effects and public values. This entry begins with a discussion of theoretical perspectives that inform the understanding of governance as a public management theory and the role it plays in the support and development of policies such as urban regeneration. It then turns to an overview of the effects that governance produces on urban regeneration as a process aimed at adopting measures attempting to reverse economic, social, and material decline of a given urban system.

G

## Theoretical Perspectives

There is an ample debate on the definition of governance since it gives order to a manifold of concept's contents and denotations. A number of interrelated theoretical approaches and perspective of governance, its workings, distinctive elements, problems, and agenda, have been used to explain the relationship between individuals, their territory and decision-making. This rich literature demonstrates the elasticity of governance as a concept, which denotes a new process of governing in the modern era. Nevertheless, what remains central to all theoretical approaches mentioned above is that the interest in governance represents, in part, a response to the recognition that improvement in the capacity of government is not, by itself, sufficient to ensure better outcomes from government actions. Governance implies, inherently, the commonly held view of the pivotal role played by the community, intended as people working together. For the purposes of this entry, it would be appropriate to concentrate on the definition of community governance (CG) as linked, *in primis*, to the local dimension, that is, local governance (LG).

LG denotes a more specific meaning that unleashes the idea of self-organizing and interorganizational networks, as Rhodes postulated (1996) where networks are nurtured by continuous interdependence among network members. Interdependence stands as a mechanism offering valuable linkages between individuals who create a system of multiple interactions, rooted in trust, in the absence of hierarchy (Rhodes 1998). The established continuing interactions, subject to rules negotiated by network participants, are characterized by a significant degree of autonomy from the state which, having lost its sovereign position, acts as a steering agent for the decision-making (Rhodes 1996). LG owes its definition to the pervasiveness of networking (Rhodes 2000), whereas the LG approach gives emphasis to a relation/interaction between civil society and government in determining bottom-up policymaking and strengthening local accountability. Since LG expresses itself in a socially and culturally defined local context, it is founded on the creation of knowledge which is later shared among the heterogeneous participants taking part of the network relationships.

In other words, the ultimate achievement of LG hinges on the notion social capital (it will be reviewed in the following section) that is an asset produced/stocked in a well-defined territorial context linked to the concepts of trust, generosity, and collective action, as Putnam asserted (1993), the latter being necessary elements for solving social disputes. It is just in this latter attempt of finding tailor-made solutions to the local community arising problems that local governance shifts into the notion of community governance.

Community governance (CG) relies on the concept of community, and it better captures the aspects of a good governance which explains the popularity of the concept of social capital emphasizing on what actors do and what type of relationships they held. CG becomes an alternative framework to public governance since it is founded on behavioral and social elements and aims at filling the gap following the failures of both the State and the market. After the government's retreat, the community plays an important role to the extent that its members are the repository of all that precious and pivotal information material regarding the needs and capacities of other community individuals. Therefore, the communities, defined according to their relational and geographical contours (Rudkin 2003), represent real structures of governance. By this perspective CG makes reference to the fundamental social steering decision-making through which government and society, within the state's institutional framework, frame and design specific public policies and services in order to address particular social demands and contingencies. Some authors, such as McKieran et al. (2000), simply defined CG as collaboration, since it is based on the recognition that the complex issues facing communities cannot be solved by any one person or sector alone but requires collaboration.

At its core, CG seeks to create a trusted community-based entity which integrates the mutual knowledge gained through collaborative actions to the benefit of the community involved as a whole. As such, it gathers a broad range of stakeholders together: community residents, elected officials, businesses, and civic actors as well as professional services. By the same token, Bowles and Gintis (2002) preferred using CG in alternative to social capital by claiming that it better captures aspects of good governance. Also, it emphasized on people's actions in accomplishing a goal of mutual social benefit and in addressing certain problems that single individuals cannot face alone. Importantly, the CG dominant logic focuses on the relationship's evaluation between action resources and their effectiveness (Osborne 2010). In particular, it is important to better understand the role of social capital as an asset which expresses the capacity of communities to act together in the pursuit of public policy outcomes.

Social capital, as Bourdieu postulated (1983), represents an asset that a social actor owns, expressed in terms of relationships of mutual knowledge or mutual recognition. Similarly, Coleman (1988) defined social capital as a specific term connoting interactions since it captures qualities inherent in social relationships. For it, social capital represents a necessary relational resource for action. The concept has recently been widely used in the literature to describe the

nexus of social factors that define a community's social life and fabric so that it has become a pillar of CG and stands as a sine qua non condition to define and encourage interactive, relational, and partnership-based actions, in other words, to support community building. Scholars have argued that CG contains community building as a central issue and can be viewed as the soul work of governance. The attitudes, behaviors, and relationships that develop as a result of social interactions within the community are increasingly seen as the elements of a community's social capital.

This conception of CG identifies, then, the community as an essential factor for producing good government. At turn, to increase the community's capacity to produce social capital, government unleashes policies that encourage investments on projects that are likely to improve the condition of the urban environment and, at the same time, would ensure high-quality living standards for the community. This vision of a built community is one in which individuals look out for both themselves and for others and where they are connected meaningfully with one another by developing and utilizing the existing social fabric.

The central tenet is that exploiting a plentiful resource from the social life of the community is a key step in catalyzing collective action, building collaborative relationships among key community members, in other words, building community capacity. Most researchers contend that the sense of community and community capacity to build itself tends to be significantly high in places that are residentially stable and associated with neighborhoods that have high rates of homeownership or are characterized as safe and orderly. This assumption connotes that community building begins with an investment in the neighborhood's social infrastructure. A neighborhood could be perceived as a complex adaptive system, the so-called urban system as it consists of many components that interact with each other and with the environment of the neighborhood. This means that processes that take place in a neighborhood can never be reduced to the action of one single individual. Of course, such an urban system stands as the ground for setting up development projects leading to an improvement of life and to ensure a safer and qualitatively wealthier urban community where positive outcomes are evaluated in terms of the quality of public services delivered.

## Stet of the Art: Effects of Governance on Urban Regeneration

As noted above, CG is believed to be most helpful theory in explaining and determining new associating networks within urban systems and regeneration processes. Hence, CG produces a number of effects on an urban system. When individuals share similar value systems, they are more likely to share a sense of community, an attraction to place, and a sense of trust and mutuality. Because governance makes reference to a rather complex system of different interactions among actors (having different interests, resources, and interdependencies), hence, it creates a structure that deals with a collective challenge (Heylighen 2006); it can be qualified as a tool for analyzing the politics of urban regeneration. Carr et al. (1993, p. 344) have asserted that "When public spaces are successful [. . .] they will increase opportunities to participate in communal activity . . .. . .and the growth of public life, is stunted by the social isolation of ghettos and suburbs. . . ..

In the parks, plazas, markets, waterfronts, and natural areas of our cities, people from different cultural groups can come together in a supportive context of mutual enjoyment. As these experiences are repeated, public spaces become vessels to carry positive communal meanings."

Regeneration, as a concept, embeds the significance of renewal which refers to action of revitalization or redevelopment of a given setting. If referred to urban renewal, urban regeneration becomes a widened concept since it is associated mainly with economic and infrastructural development. Currently, it represents an umbrella term which conveys the meaning of promotion of the social, economic, and environmental well-being of an area.

Urban regeneration is a very multidisciplinary issue for researchers and practitioners interested on the vital topic of the proper and effective way to govern regeneration processes despite the

pressing challenges of sustainability. However, as a practice attempting to manage public space in ways that restoration of the urban setting and its connectivity is made through building sociality and civic engagement, it starts from the analysis of a close relationship: the public dimension and the community. The former should not be merely intended as a spatial and social setting but as a value-generating space where the public value created is shared as well as the benefits of accessing to collective public resources; the latter refers to the community living within a well-defined territorial space that expresses its continuous commitment and attempts to engineer social interactions oriented toward the design of welfare service which responds to its needs.

Recognizing urban regeneration as starting from the community potential, it implies the understanding that it is a community planning activity, which suggests a strong link between an urban public space and an urban civic virtue and citizenship. In this communitarian and urban conviviality's approach to planning, where urban policies toward public space are socially inclusive, the public space responds to the same people's willingness. And people, at their turn, reply to the same setting to the point that a strong bond between the community and the setting is created. Such thinking would lead to assume, as some authors have, that a well-designed and well-managed space is free from the armor of the daily life allowing individuals to see others as whole people (Carr et al. 1993).

The due premise about the definition of urban regeneration planning as the process of a shared understanding and goal sharing by self-organized initiatives that originate in the civil society from community-based networks implies that governance produces effects on urban regeneration which makes the latter deeply problematic.

It could be argued that the effects are of three types. Firstly, because cities and urban systems show an undoubted complexity for their being adaptive entities (Baynes 2007).

Secondly, because urban renewal upholds overlapping areas of policy concerns.

Thirdly, the topic becomes very critical when it comes to terms with issues of partnerships and patterns of regular interactions which are, yet, a distinctive mode of governance but could also end up in a lack of collective consensus on specific urban regeneration policies.

Claiming that an urban system is a complex adaptive system would imply that the urban setting, if it is true that it resembles a system of governance as Elinor Ostrom (1990) proclaimed, should be adapted to the specific context. In fact, as a polycentric institutional arrangement and multi-actor decision-making unit (Brugge 2009), an urban public space measured the rhythm of collective interaction and endurance through three key elements: coevolution, emergence, and self-organization. The first element alludes to the fact that complex adaptive systems coevolve with the systems' environment through interdependency and feedback loops. The second one ascribes to the rising of new structures, within the system, from the inside out, within the lines or borders of the system. The third one recalls the meaning of governance, referring to the ability of developing system structures as a result of the system's internal constitution. For this purpose, it could be argued that all three elements that make together the direction of change, adaptation, and development of a system depend upon what the actors within the system itself expect in reaction to the changes of endogenous and exogenous and external conditions.

Having accounted for the key features that describe the complex urban system as evolving, adaptable, and developing, the second effect that governance produces on urban regeneration deals with existence of overlapping areas of policy concerns. This argument is true when, facing urban regeneration-related policymaking and interventions, it becomes very difficult to define a priority due to issues clashing and overlapping. In fact, the acknowledgment of an environment as a whole requires the integration of many disciplines and evaluation of the complex interactions between single systems within the overall urban system such as transport networks, housing infrastructure, water and energy supply, and social networks. On top of that, policy issues find themselves clashing with a plethora of actors' claims, which are heterogeneous and fragmented by nature, with the result that public managers, practitioners, and experts find it difficult to synthesize and systematize such crowded and disordered information.

The third effect on urban regeneration relates to the issue arising when coping with the analysis of a complex system such as the urban system, more specifically in the definition of the problem or perceptions of problems by actors gathered in a network. Certainly, perceptions can be several and heterogeneous since they reflect open, disorderly, diverse, incomplete, improvised, crowded views and values depending on which partnerships actors belong to. Such differences also mirror the key elements at the core of the urban regeneration's governing process, being also at the basis of the governance as a concept: the partnerships.

Partnerships, which offer a sophisticated neo-pluralist understanding of local networking (Davies 2000), are of different types, and their categorization can be made not only on the basis of their status but also on their factors of success. Stone (1989) asserted that governing power in urban regeneration's realm depends on sustained interorganizational collaboration around agreed objectives; other authors, such as Elkin (1987), put forward that the urban policy agenda tends to reflect the preferences of people organized in partnerships due to policy convergence, as some authors have explained (Evans and Davies 1999).

## Perspectives on Urban Regeneration and Its Challenges

The politics of urban regeneration has used theories on partnerships to analyze the dynamics of interorganizational governance in order to explain the value of partnerships (see Lawless 1994; Stoker and Mossberger 1994; Harding 2000; Davies 2001) that go beyond public service delivery, as argued by the articles on "Theory of Organizational Partnerships" (Mcquaid 2010).

Along these lines, the likeness of partnerships has to be associated with two factors that affect their performance: the participants and sustainability. According to participants, partnerships would be expected to include key public sector and private economic actors cooperating through informal networks that would enjoy a high level of practical autonomy from political influences at other geopolitical levels. Partnerships involve collaboration between a range of organizations from the public and private sectors. Like governing networks, they are built on trust and diplomacy, and for that, they also denote a set of stable of relations, that is, long-term collaboration to coordinate collective action around an agreed set of goals.

As far as sustainability is concerned, partnerships are sustainable entities, meaning that their survival depends on their ability to command and create value, and partnerships would also enjoy considerable reach in their efforts to influencing politics across the policy spectrum. Gerry Stoker (1989), for example, famously argued that partnerships create added value, to the extent that individuals and organizations must collaborate if governing outputs are to be achieved. Therefore, collaborative synergy is an important issue for theories of partnerships.

However, a clear distinction between policy and implementation partnerships, as some authors have emphasized, becomes useful at this point (Skelcher et al. 1996). Collaboration among actors tends to be structured in two ways so that, at one side, it produces policy partnerships responsible for establishing goals, and at the other side, it creates implementation partnerships responsible for project delivery.

In the first case, as policy partnerships, these work for facilitating and coordinating processes based upon cooperation mutualism, symbiotic interdependence, and trust, no matter whichever nature they can be (i.e., public-private partnerships and related forms). Here comes the assumption by Erik-Hans Klijn (Klijn 2008), who in his article, "Trust in Governance Networks," emphasized the value of trust for the functioning and performing of networks and partnerships marking that "trust reduces transaction costs, facilitates cooperation and stability, stimulates learning, knowledge exchange, innovation." In the case of implementation partnerships, their working aiming at project delivery is very much dependent upon their key success factors. These latter lie in the definition of a strategic focus, type of leadership, the extent of partnership actors' capacity to jointly develop products and services, and the degree of sharing risks, costs, and resources which are connected with service development.

Needless to say, nevertheless, that partnerships, whether they are policy or implementation type, they are exposed to face challenges. These can be related to relationship's complexity (of issues, deals, contracts); the roles that the government adopts, especially with reference to public-private partnerships (PPP); the long-term contract ("incomplete contracts" problem); and the fundamental democratic aspects of PPP (participation, transparency, accountability, control) which might not have been, a priori, institutionally resolved. Taken together, the attempt made in identifying partnerships as a distinctive mode of governance can represent the evidence of a culture of partnership working at the basis of an urban regeneration practice (Healey 2006). Partnership offers a greater potential for the growth of networking as they are created on local concerns, initiatives, and resources; therefore, the main effect that governance produces on urban regeneration is its ongoing capacity to produce favorable conditions for networking. In other words, the politics of urban regeneration can be seen as the politics of governance by partnership (Davies 2002).

## Conclusion

This entry has provided an overview of what is known about governance and the role that it plays in shaping policymaking and decision-making in a given territory. It began with a discussion of theoretical perspectives on governance, with a specific focus on local governance and, later, on community governance. Because governance makes the most of the sense of community developed within a territory, it emphasizes on the importance of community engagement in networks for an effective community change. Within this entry, some essential theories to understand and value the complexity of the urban system, whether that is called city or neighborhood, have been reviewed.

Besides, both the local and community governance frameworks are introduced to help determining the dimensions of a network and actors' involvement in the definition of the problem, policymaking, working on the development and implementation of plans in order to influence the desired direction of public service delivery. As the desired direction is complied by actors empowered by the ability to adapt to arising changes occurring inside out their environments and develop and implement actions in a system's network, institutions and authorities within that system are taking part in shaping and determining what is desirable as agents of community empowerment.

Next, the entry turned to a discussion of the effects of governance on urban regeneration. Tangential to all effects, there is an array of community actions, facilitated by values such as trust, solidarity, cooperation, and generosity that are congruent with those of other network's actors for developing and improving both the social and physical characteristics of the urban space thy live in. Community development initiatives are cognizant of the importance of goals' sharing and shared powers which make it easier for the people, as individuals or as organized in networks and partnerships, to achieve their objective in taking part of the public service delivery.

This entry also discussed the partnerships' framework which adds to the basic understanding of governance as networks in fostering community engagement in shaping policymaking especially when referred to urban regeneration. The explanatory range of partnerships indicates that collaborative governance generates an added value for actions of urban regeneration which are oriented toward the attainment of quality, as a whole, within a community, then, in specific urban setting.

# Governance by Network and Its Applicability to National Aid Policies and Local Governance

Hideaki Ashitate
Kyoto Sangyo University, Kyoto, Japan

## Synonyms

Creating support, trust, confidence, and satisfaction; Improving local democracy; Official development assistance (ODA); Participation; Reforms in local legislative bodies

## Definition

Governance by network; decision-making, where various kinds of actors are involved; a hybrid of governance by hierarchy and governance by market.

## Introduction: Three Types of Governances

This article interprets changing Japanese governance, especially foreign aid policies and local

**Governance by Network and Its Applicability to National Aid Policies and Local Governance, Table 1** Three types of governances and their characteristics

| | Markets | Hierarchies | Networks |
|---|---|---|---|
| Basis of relationships | Contract and property rights | Employment relationship | Resource exchange |
| Degree of dependence | Independent | Dependent | Interdependent |
| Medium of exchange | Prices | Authority | Trust |

legislative bodies, by the framework of governance by network.

Rhodes (1999) identifies three types of governances: governance by hierarchy, governance by market, and governance by network. Table 1 clarifies some of the characteristics of the three. The first and the third types are not mutually exclusive. One may notice that private companies, which can be among members of a large network, are important factors contributing to market as well. In fact, literature review reveals that governance by network is a hybrid of two other forms of governances.

According to the third row of the table, networks are based on members' mutual trust just as markets function well via prices, and "trust" is a keyword here. It is sure that Nye and Zelikow (1997, 254) criticize that, in survey questions, there are no distinction between "trust," "confidence," and "satisfaction." However, surveys and researches using perfectly rigid distinction are hard to find, and this article considers these three terms to be interchangeable.

## Reforms of Public Sector and Governances by Market and by Network

Extant studies such as Johnson (1986) assume that Japanese public administration is bureaucratic, meaning that Japan is governed by hierarchy. However, market-oriented reforms of public administration, such as privatization of governmental corporations, have been proceeding since the mid-1980s. Japan Railway Company (JR), Nippon Telegraph and Telephone Corporation (NTT), and Japan Tobacco Incorporated (JT) are currently large private companies in Japan, but all of them had been owned by the government until the mid-1980s.

Postal services are another example. As a fruit of reforms begun by Prime Minister Hashimoto in the late 1990s, the Ministry of Posts and Telecommunications was downgraded to a governmental corporation in 2001. After tremendous victory in the general election of the House of Representatives in 2005, Prime Minister Koizumi privatized the corporation.

In addition to governance by market, recent trend shows involvement of more kinds of actors, which seems sympathetic to the framework of governance by network.

Taking an example from official development assistance (ODA), one can recognize that a variety of actors, such as NGOs and universities, have been engaged in aid policies (e.g., implementation of projects) in the name of "participatory ODA" since the 1990s. This change results in an increase of the funding to Japanese NGOs; for instance, "Grant Assistance for Japanese NGO Projects was established in 2002 as a program independent from the previous Grant Assistance for Grassroots Projects," which had been originally begun in FY 1989 with the budget of 300 million yen (Ministry of Foreign Affairs of Japan (MOFA) 2013, 6). The "amount of funding provided by the scheme has increased [. . .] from FY 2002 (approx. 600 million yen)" to FY 2016 (about 4350 million yen) (Ministry of Foreign Affairs of Japan (MOFA) 2013, 6). In addition, by January, 2017, Japan International Cooperation Agency (JICA), who is responsible for implementing ODA projects, has sent more than 50 thousands of Japanese citizens as volunteers in developing countries (Japan International Cooperation Agency (JICA) 2017, 2).

One can witness reforms consistent with governance by network in local governments as well as in the central one. Local governments are encouraging participation of residents when making decisions.

## Governance by Network and Its Outputs and Outcomes

A next question is about differences that governance by network makes. This is because one can easily remember that the framework of "veto players" argues that the more stakeholders participate, the more dominant the status quo is (c.f. Tsebelis 2002). Bouckaert et al. (2010) emphasize that proliferation of public organizations accelerates consolidation or, in other words, coordination. Their argument is mainly about new public management (NPM), but it is applicable to governance by network as well.

It is sure that the argument of governance by network is said to be about a process rather than a result, but this does not mean that there has been no research whose interest is in results (outputs and outcomes), especially positive ones. Klijn and Koppenjan (2000, 109), for instance, explicitly mention "three motives for the introduction of [the] new forms of participation." They are "creating support," "improving quality," and "improving local democracy." Klijn and Koppenjan (2000, 109) are consistent with Rhodes (1999) since the latter assumes that trust comes with networks as shown in Table 1. As an example of citizens' support, Klijn and Koppenjan (2000, 109) deal with a case of the Bijlmermeer, Netherlands. This suggests that the first and the third motives are not entirely separable. This article focuses mainly on the first one and next on the third one.

The next section reviews a research on the connection between "participation" and "trust" in the context of Japanese ODA. The fourth section mentions relationship between "participation" and "local democracy," the third motive Klijn and Koppenjan (2000, 109) point out.

## Citizens' Participation in ODA and Increase of Support

With regard to Japanese ODA, there have been some studies that deal with an effect of "participatory development," where Japanese government involves people in developing countries when implementing Japanese ODA projects for those developing countries. Tonami (2009) is a good example. It is a study on the environmental aid project, including subprojects such as management of garbage, in Thailand, funded by the Japanese government. One of the conclusions of Tonami (2009) was that citizens' participation could make local citizens more responsible at least for a short time period.

Extant studies on Japanese foreign aid suggest that participation seems to increase public support of governmental aid policies. As an example, Ashitate (2015) is reviewed here. Ashitate (2015) uses Japan General Social Surveys conducted in 2006 (JGSS-2006), where Japanese citizens were asked to answer various questions such as those about participation in aid related activities as well as Japanese policies and institutions.

The survey includes questions about whether people think that Japanese foreign aid is inevitable for economic growth of developing countries. People chose one from four answers: "1" is "agree to the statement," "2" is "closer to agreement than to disagreement," "3" is "closer to disagreement than to agreement," and "4" means "disagree." Excluding answers of people without clear opinions, Ashitate (2015) utilizes answers to this question as a dependent variable (named "OPADVITAL").

There are three independent variables, and two of them are related with participation of Japanese citizens. One is "XADDONAT," an answer to the next question: "Have you given donations for supporting developing countries or sent goods for the countries?" The other is "XADVOL," an answer to the next question: "Have you done any jobs helping less developed countries or volunteer activities for those countries?" In both questions, positive answers are coded "1," and negative ones are "2." Also, in the similar way as extant studies using JGSS data, numbers of groups they regularly take part in are controlled (named "MEMBER"). The maximum number of it is six, and the minimum is zero.

As a control variable, general trust in the government is a candidate since if people distrust the government and dislike its policies, they do not highly evaluate specific policies, either. It is unfortunate that JGSS-2006 does not have such information. Therefore, Ashitate (2015) utilizes the best available ones, meaning answers to the question

asking general trust for central ministries in Japan (TR3BCRAZ) and political parties respondents support (XX8PLPTY). With regard to TR3BCRAZ, "1" means much trust, "2" is a little trust, and "3" means no trust. As another control variable, political parties that people usually support are used since if the respondents support one of the political parties making the coalition government, they are highly likely to support governmental policies. Therefore, in order to make dummy variables, Ashitate (2015) codes in the following way. If a person supports the Liberal Democratic Party (LDP) or *Komeito* Party, XX8PLPTY is one. Otherwise, the value equals zero.

Ashitate (2015) estimates coefficients by ordinary least squares (OLS). The results are as follows (Table 2). Holding other variables constant, in the first model, those who have participatory experiences are more likely to recognize importance of Japanese foreign aid by 0.288 point out of the full range of three. In the second model, the change is smaller (0.131), but the coefficient is statistically significant.

## Governance by Network and Local Democracy

Yashiro (2013, 188) insists that a collaboration between nonprofit organizations (NPOs) and city governments might be successful if they trust each other. Yashiro (2013) is a study about trust, or the first motive of Klijn and Koppenjan (2000). One may wonder about their third motive, meaning whether local democracy is strengthened by governance by network as Klijn and Koppenjan (2000) suggest.

Research Institute of Manifest at Waseda University gives helpful information. The institute ranks around 1500 of, or most of, local legislative bodies based on progresses of reforms by themselves, and local governments are conscious about the ranking list. Specifically, the institute evaluates "publicizing information," "citizens' participation," and "strengthening local bodies visa vie core executives," and computes general ranking based on the three factors. The second factor is closely related with "improving local democracy." Legislative body in Machida city, Tokyo, is a good example to see proceeding attempts to engage many citizens. For example, the legislative body admitted stakeholding citizens to make a speech in the relevant committee. In the realm of citizens' participation, Machida city was ranked at the 8th place in 2013, the 5th in 2014, and the 3rd in 2015. As a result, Machida city was given high composite points as a whole, too. The city was at the 11th place in 2013, the 10th in 2014, and the 9th in 2015. Another example is Memuro town in Hokkaido, which allowed citizens to monitor its legislative body. The town has been ranked at the first place as a whole since

2014, and quite a few local legislatures visited there. Such progressive cities function as a frame of reference for other local governments, and it is expected that diffusion of reforms occur.

## Concluding Remarks

Using the framework of governance by network, this article analyzes Japanese foreign aid policies and reforms in local governments. The results seem to be as extant studies suggest: increasing support of policies and enhanced local democracy. However, there exist some limitations. Opinion surveys have been rarely conducted to measure supporting rate of specific policies in local governments. Further research on results of governance by network remains to be seen.

# Governance Failure

Amiya Kumar Das
Department of Sociology, Tezpur University, Tezpur, India
Centre for Public Policy and Governance, Tezpur University, Tezpur, India

## Synonyms

Complex governance; Governance crisis; Ineffective governance; Mismanagement

## Definition

Governance failure may be defined as the undesirable or adverse outcome from a governance process. It may happen during designing, planning, and implementation of a policy. This idea is also expressed in terms of policy failure or state failure.

## Introduction

Governance failures tend to occur when there is a miscoordination or disjunction between various stakeholders in a governance process. Frequent consultation and seamless coordination could lead to a greater success in implementation whereas ignoring stakeholders during the process may result in a policy failure. Knowledge is essential in any field to carry out a function effectively. Experts are consulted and given responsibility to

design public policy. Sometimes it becomes successful and sometimes it is not. In this context James Scott has shown how expert knowledge is also prone to failure. Generally, policies are made without taking account of the local specificity. Similarly, Timothy Mitchell has argued how the rules of the experts have failed in the context of Egypt (Scott 1998; Mitchell 2002).

Governance failure could also be seen in the process of social engineering. The modern technocratic idea of changing social things with technological intervention has backfired with the process of social engineering. Most well-meaning policies and programs intended for the poor have also failed in some parts of India. Jessop observes in the context of governance management that, "most of the time there are tendencies of governance failure like market, state and even meta-governance. Even then public–private partnership is essential in securing the stability in terms of social, economic and community development. There should be greater commitment to participatory politics based on stake holding and to sustainable economic and community development" (Jessop 2000, p. 32). In a similar line, Malpas and Wickham contemplate that governance seeks control of its objects and therefore failure itself will always remain obscure from within any particular governing practice (Malpas and Wickham 1995) and the issue of failure is also perceived in the similar manner by Chhotray and Stoker who argue that governance failure might occur because of irresolvable conflict between interests, a lack of trust between agents, and inept steering by state actors (Chhotray and Stoker 2009, p. 48).

## Governance in the Grassroots

Governance has often been equated with the representational values of influence and power at the discretion of political authorities and their enforcement of rule. The success of governance mechanisms is difficult to empirically define and envisage through definitive criterion of sovereignty and territoriality with the intervention of transnational systems within the scenario of political, economic, and social affairs. Neoliberal responses largely involved the market and revolved the nature of state and political consciousness. But economic inflations and market failures limited the assertion of state institutions and made it difficult to adjust to private–public partnerships. The mixed economy model adopted by India, to a long-term "establishment of rules and laws which were aimed at controlling and regulating the economy and instead ended up hampering the process of growth and development . . . The economy was facing problems of declining foreign exchange reserves, growing imports without any rise in exports and double-digit inflation" (Bhaduri 2013). Even, political culture is increasingly disparate, which lies within the governmental structures of self-regulation but more within the regimes of governance. Political culture can be described as the psychological dimension of political systems, including politically relevant beliefs, values, and attitudes (Welzel 2009, p. 299). It presents a constant interaction between the individual and collective agents under the affairs of administration, moving from social structures to the legitimacy of political institutions interlinked with it. It is within these structures of objective dissemination of egalitarian beliefs that governance fails in attempts of homogenization and marginalization of knowledge. Although governance and government has often been equalized, the intrinsic meanings for both are differently placed through situations of transcendence in specific political cultures. Governance "is a generic term to describe decision-making in organizations such as corporations and universities, while government implies rule and control of political institutions over its citizens" (Das 2020).

Decision-making often results in controversies and inconsistencies due to the protection of interests of multiple agents across regional, national, and transnational networks. The ethics of development glorifies models of infrastructures on one hand, while legitimizing the internal logic of hierarchical social structures within democratic regimes. The historical transition of political ideologies with economic structuration ensured the patterns of negotiations between actors with "power" in concrete and abstract forms, acquiring

more potential to dominate the scene. Power is represented in system of rules and legal principles, which acquires a dynamic reality in the context of democratic societies such as India. The attempt to initialize superior power of mainstream government on local-level political structure would be complex and might lead to failure of governance across micro levels.

Taking cognizance of these features, governance is the shift of power in all directions – upward, downward, and sideways. The relationship between governmental as well as non-governmental entities creates avenues for interdependence and distribution of power, which can be self-limiting in terms of political functions and machinery. Rhodes stated that "the growth of governance reduced the ability of the core executive to act effectively" (Rhodes 2007). The mechanisms of governance will be a failed approach if the sense of responsibility among different actors is not turned into a co-responsibility. The rise of new forms of digital governance also changed the dynamics of life-processes, creating an over-regulation of state subjects while blurring the lines between the public and private domains. For instance, the Global Positioning System (GPS) rules out governance structures of constant surveillance in urbanized conglomerations, depicting a system of successes as well as crisis of entrenched realities such as social pathology. So, "social reality is an environment of development: human relations according to rules and institutions of power and order, codes of communication, symbols, etc." (Sánchez-Bayón 2014, p. 196).

This entry provides a view on how the underlying phenomenon of mechanisms of governance enacted at the level of varying power structures often suffers from inconsistent planning and strategy implementation. The debatable point is the consideration of stakeholders for governmental as well as civil society programs, which might lead to democratic pitfalls. The conflict among stakeholders limits the possibilities of understanding the problem as well as its solutions. The entry concludes that a considerable amount of ambiguity in the conceptualization of governance might lead to misappropriation of norms, policies, and its outcomes.

## Perspectives

The meaning of governance varies across disciplines, approaches, and theoretical contexts such as political sciences, sociology, public administration, law, and economics. The Report of the Commission on Global Governance, titled "*Our Global Neighbourhood*" defined governance as the sum of the many ways through which individuals and institutions, public and private, manage their common affairs. It is a continuing process of conflictive diverse interest that may be accommodated and through which cooperative action may be taken. It includes formal institutions and regimes empowered to enforce compliance, as well as informal arrangements that people and institutions either have agreed to or perceive to be in their interest (Commission on Global Governance 1995). Governance is a normative concept of transparency, accountability, and values where actors interact in specific social contexts for effective distribution of sociopolitical and legal recourses. But the perpetuation of anarchy is often possible with respect to unaccountable governance, corruption, human rights violations, and no clear delineation of political and economic agendas. Governance is narrowly perceived within interorganizational practices, and problems related to inter-systemic steering will produce implicit or explicit effects on interorganizational relations, even if belonging to different institutional orders. Hierarchies are entangled reducing the role for the other. The contestability and limits of the institutional boundaries are transcended in the contemporary era, which may magnify or destroy mutual coherence within the garb of competitiveness and social complexities.

Accountability in governance resorts to sustainable development, which might increase equity and efficiency in governmental targets. The goals of sustainable development encompass social, environmental, and economic aspects, which depends to a large extent on the implementation efforts and long-term governance, applying rules within a defined organization of operation. But, it is difficult to allot differential regimes to governance and government, as government

serves as the political and administrative structure, which constantly negotiates policies and schemes to the point of significant estimations. The imbalance in such estimations might lead to failures in distributing resources and ensuring access to vulnerable populations. Right strategy in right direction requires not only profit-based but also people-based models, catering to generating capabilities. Capability is a broad avenue seeking the need for developing functions and abilities of the people. Amartya Sen in his "capability approach" considered capability and functioning as core ideas, as he defines – "a functioning is an achievement whereas a capability is ability to achieve. Functionings are, in a sense, more directly related to living conditions, since they are different aspects of living condition. Capabilities in contrast, are notions of freedom" (Sen 1994, p. 273). Destruction of capabilities can be projected as a failure of governance not only at the discretion of the legitimate political authorities but also other agencies – regional or national, participating in the process of dispatching governance and its objective structures. The larger question lies in the social and cultural settings, which determine possession of capabilities and well-being. So, failure in governance threatens individual's state of being and can perpetuate structured poverty.

Governance is not only a limited term in application to governmental structures or political parties, it is an act of regulation at the discretion of any organization, association, or institutions. The ability of the government in exercising its authority is lower when trilateral rather than when bilateral arrangements are involved, as in these cases governments may be dominated by markets and network actors (Howlett and Ramesh 2014). The creation of public values by the civil society organizations often disburses accounts of hegemonization in the form of information gaps, lack of incentives, and political interference within local and delimited contexts. The infrastructure projects through increases in productivity and production, however, lead to involuntary displacement, creating untold miseries while affecting both developed and developing countries. For instance, most of the developmental projects in the state of Orissa were constructed in areas leading to the displacement of the people from their homeland. Statistically representing, the number of people who were displaced in India and have not been rehabilitated properly between 1950 and 1980 ranges to over 11.5 million (Mohanty 2011). These forms of state failures can be linked to the specific procedural factors that block effective policy-making and implementation. The states involved in the developmental projects are subjected to the structures of bounded rationality, characterizing limited information, uncertainty, and time pressures. They often pursue multiple contradictory goals, which are inherently feasible with ill-defined nonmarket outputs (Jessop 1999).

While neoclassical economists provide solutions for market failures in the form of more markets, welfare economists call for more state intervention. This is intended to correct market failures. The ethics of market rationality in free and equal exchanges rather than the careful rules of economic regulations place the success or the failure of the market forces in terms of substantive criteria such as the market forces, uneven impact on wealth, income, life-chances, or regional balance. But the conditions of "rationality" within the markets often make it difficult to observe inequalities, which are attributed to market inadequacies rather than failures (Jessop 1999). The institutional redesigning of the state along with the self-correcting policy cycles can redefine division of labor in the state and wider political systems, not detached from market networks and agents of governance. The reforms feature administrative restructuring, privatizations, deregulation, decentralization, and other efforts with degrees of reversals across differential patterns, leading to apparent failure of reforms (Ramesh and Howlett 2006). The government per say is perceived as a more overregulating force and efforts are often directed to direct transition into a structure less controlled by the government, such as allocation of markets and private actors in nonstate efforts. The recent developments have been made from hierarchical and market forms of governance to network-centered governance modes (Lange et al. 2013). This is beneficial for an economy based on welfare models where social protection

measures and safety nets need to be allocated across differential regimes. Collaborative governance combined aspects of both governmental and market-based arrangements by bringing private and public actors in policy sectors (Rhodes 1997). But the successful interpretation of such arrangements hase little authority of stance. Hybrid elements are introduced into the governance structures but such diffused networks of governance is difficult to reform than traditional hierarchical structures having a concrete root.

However, with governance arrives the contradictory distinction between the state and the society. The exact definition of state and society is ambiguous as the boundaries of state are transient across time and space. The understanding of political institutions, events, and behavior is essential to produce an analytical frame of reference for state. Randal Collins in following Weberian analysis of comparative politics framed that Weber rejected notions of interdependent parts within a social unit. The primary analytical concepts of Weber are the material and ideal interests of individuals, groups, and organizational structures to further their interests. Weber considered the analytical framework of "state" and "society" where groups forms the constellations of interest by which parties act together voluntarily for mutual benefits occurring at the sphere of society. On the other hand, the sphere of state characterizes coordination that is based on the dominance in which one individual or group is placed in a position to enforce his/her will on the other. Collins rejected the structural-functional paradigm of understanding political processes, which correlates political, economic, and cultural organizations for social division of labor. He conceived that the principle of action in each sphere is not contingent on those of the other (Brand 1973). The political and economic structures must be analytically separated from each sphere and cannot always be exclusively conceived to be dependent on each other. The failure in governance is often caused by ambiguity and collision of interests in different spheres and ideologies. Ideals and values are disparate for different groups such as business, labor unions, or governmental agencies, and disagreements exist on how to put ideals into practice. So, governance is based on political contours and practices where the failure results from the dichotomy of relationships between means and end relationships.

## Social Protectionism and the Dilemma of Governance

Social protectionism as an ideology and practice reflects the usages of strategic decision-making within the purview of reasoning, reflection, and relevance. Social protectionism varies with reference to the nature of communities deprived and culture of policy making. A generalized indicator of social protectionism are the "public actions taken in response to levels of vulnerability, risk and deprivation, which are deemed socially unacceptable within a given polity or society" (Norton et al. 2001, p. 21). The key component of social protectionism works within the purview of rights-based approach, which must be available to all individuals without discrimination of any kind. It is the context that determines which modes of governance and design issues can be supplemented. The COVID-19 pandemic exposed the preexisting gaps in the provisions of social protectionism in India as well as across the globe. The pandemic made far-flung impacts beyond the severity of health and potentially devastated social, economic, and political fronts with long-standing implications. Debt burdens, inadequate health systems, informal economies, high population densities, rural and urban migration, resulting from social distancing and subsequent lockdown made the crisis more acute. The United Nations estimates that developing countries would require $ 2.5 trillion in rescuing funding to avoid the catastrophe of health and economy (UNCTAD 2020). Even prior institutional bottlenecks turned the situation into an ambiguous state of affairs. Governance within a contradictory dimension of internal disruption and external struggle and dialectics can entail integration of market and state into society.

However, while considering failures for policy actions, it cannot be relegated merely to the structural determinants but also to the individual context of the problem. State failure can be conceived

not only through a lack of institutional design, social pacts, or public services but also a failure of governance. The two forms of governance failure is the lack of capacity to provide systematic stability of society and economy and failures of organizations within the bureaucracy to coordinate functioning abilities (Peters 2015). These failures might operate even if the political entities are legitimate, stressing the need for envisaging governance and government in their own right. Governance is not bounded within narrow departments but comingles along departmental lines, so success of governance is not only fulfilling a narrow target but also making comprehensive assessments of the problem. The failures are produced through the incapability of addressing "more than a portion of the problem confronting the public sector and the society" (Peters 2015). The failure of specific public policies cannot be considered as a governance failure. Strongly positioned states might provide opportunities for implementing policies, which can be estimations of being successful.

Nevertheless, delivering a program might have negative consequences even within the same policy area designed as per the intervention. While social protection measures have been implemented in the Indian context with regard to the cash-based transfers under the National Social Assistance Programme and Pradhan Mantri Jan Dhan Yojana, food vouchers under the Antyodaya Anna Yojana, public works under the Mahatma Gandhi National Rural Employment Guarantee Act (NREGS), National Legal Services Authority, an organization of legal governance, stated that the nationwide lockdown led to a rapid increase in cases of domestic violence. The Times of India recorded the highest number of domestic violence cases during the phases of lockdown (Times of India 2020). Even lack of specific facilities for childcare during the COVID-19 led to more disastrous consequences. According to the reports from the Assam State Commission for Protection of Child Rights (ASCPCR), a total of 216 cases have been registered since the lockdown of which 113 cases were related to the sexual abuse of children, 13 cases were related to the child labor, 3 cases of abduction, 47 cases of child marriage, and more than 40 cases of offence against children were registered (Karmakar 2020). So, governance failure cannot be subjected to policy-making but also relegates to the effective designing of policies in order to deal with specific problems. Interventions lie not only at the discretion of the state but also organizations and branches within the state, which perpetuates through diverse domains of civil societies, market, and economy. The concept of civil society lies within the interstitial space of the public–private debate. The "public" refers to not only the government but also civil society, which is pre-conceived as a community arena. Karen Bakker, in his work on the politicization of water within an urbanized ecology, relegated to the domains of the "private and public" demarcation, which is often blurred in the potential of civil society. The "private" provision is blurred when the informal, unregulated, small-scale water supply business meets the majority of the people's needs and work alongside the community organizations. The organizations are mostly nongovernmental as well as not-for-profit in nature, identifying public ethos (Bakker 2010). This increase amplifies the dialectic of the public–private realm involved in the provisioning of water and stating authority through "water" and portals of access, as a component of governance. The analytical framework of the public–private debate within the context of the modern society, works beyond the binary categorization to include more overlapping of realms – private, public, or mediating realm of the community–corporate institutions. So, governance works within varying realms that produces different intensity of effects over time with complex realities of social equities and decision-making systems.

## Conclusion

Guaranteeing an absolute and effective governance is difficult. The complexity increases more within the multigovernance issues, its limits, and exploration of social solidarity, which raises

ethical debates. Policy and governance failure may or may not be correlated. Larger governance issues remain undermined while focusing on the micro-policy failures, its designs, as well as its mechanisms. Even short-term and short-sighted policy-making systems may relegate difficulties in coping with broad governance visions and the cognizance of geopolitical identities within multidimensions. The failure of specific policies might increase possibilities for options available in the market and civil society, while at the same time increasing the necessity for studying the dynamicity of actors involved in the governance along with their capabilities to form an alternative framework in case of governance failure. The intensity of search increases with policy failures, while culminating in leadership failure and knowledge strengthening at the same time.

Mayntz opines that governance failure might occur from implementation of policies and policy makers' deficient knowledge of causal relationships (knowledge problem), or from governability problem (Mayntz 1994, p. 13). Jessop similarly asserts that governance is always exposed to failure. One cannot ignore the issue of failure in analyzing governance. These governance failures are mainly concerned with the role of markets, states, and networks in capitalist social formations rather than more amorphous interpersonal relations (Jessop 2000). Malpas and Wickham emphasize the need for sociology of failure. They draw their argument from Foucault. How failure is centered on both known and unknown objects. Further, they argue that social life is made up of innumerable attempts to control all known objects, which sets the ground for failure to feature as a crucial element in the governance process. They emphasize that governance is necessarily incomplete and failure is the result of targeting full control or total control of governance object (Malpas and Wickham, pp. 40–45).

# Governance in Crisis Management

Fatih Demiroz
Sam Houston State University, Huntsville, TX, USA

## Synonyms

Administration; Good government; Government; Networks; Partnerships

## Definition

Governance, in the context of crisis management, refers to (1) government capacity to deliver services and manage crises and (2) cross-sector collaboration and interorganizational networks.

## Introduction

Governance is a term that is used in a variety of contexts. The goal of this chapter is to provide an overview of crisis and disaster management and how it is related to multiple aspects of governance. The following sections will define disasters and relevant aspects of governance and then lay out the theoretical and practical definition of governance in crisis management: (i) governance as government capacity and (ii) governance as cross-sector collaboration and interorganizational networks.

## Understanding Crises, Disasters, and Disaster Management Systems

Disasters are incidents that cause disruptions in societies as consequences of natural or man-made hazards. Disasters and hazards are interrelated terms, but they are not the same. Events such as hurricanes, floods, or hazardous material spills are hazards. What turns them into disasters is the impact (i.e., disruption) that they create on human social systems, such as the economy or local communities. For example, if a flood impacts an area where there is no people, that cannot be a disaster. On the other hand, if a small flood influences a two-block area in a densely populated city, the results can lead to significant disruption. Although closely related to disasters, crises encompass a broader meaning than disasters. Crises occur "when member of a social system sense that the core values of life-sustaining features of a system have come under threat" (Boin et al. 2017, p. 5). Disasters are examples of crises, but they are not the only source of crises. An influx of refugees from a neighboring country, the political destabilization of a region, or infrastructure failures are not typical disasters like hurricanes or terrorist attacks, but they can be classified as crises as well.

Historically, the management of disasters and crises has been a collaborative effort. In the early twentieth century, disasters were viewed as "acts of God," and managing them was not always at the top of the political agenda in the United States.

Churches, local community organizations, and nonprofits usually dealt with disaster relief, while the input from state and local governments was limited (Rubin 2012). Changes in the political environment (e.g., Cold War, catastrophic disasters) pushed governments to be proactive and to initiate efforts for minimizing impacts of hazards on communities. As a result, disaster management systems have developed over time. Disaster management systems have developed over time. In the early years, a militaristic top-down approach was embraced due to Cold War; however, changing public sector paradigms (especially the adoption of New Public Management and cross-sector partnerships) transformed bureaucratic hierarchies into horizontal and networked administrative systems. As this structural changes occurred, the term governance became increasingly used in crisis and disaster management contexts.

## Governance and Disaster Management

### Governance as Government Capacity

Governance is related to several important topics. First, it refers to a government's capacity to deliver services. Government capacity is critical for minimizing physical and social vulnerabilities and impacts of hazards through managing four phases of emergency management (i.e., preparedness, mitigation, response, and recovery). The ways that government agencies reach their goals are quite complex. Governments can deliver services directly via bureaucracy and public servants. Governments can also use indirect tools such as grants, vouchers, contracts, and cross-sector collaborative partnerships (Kapucu 2008; Kapucu et al. 2010; Salamon 2002). Bureaucratic capacity (i.e., direct government) is critical for delivering core government services, especially services that protect the safety and security of citizens. The management of indirect government tools (e.g., contracts, vouchers, grants) is equally important, if not more as the management of direct government capacity. This is because indirect government tools are not under the complete control of government agencies, which makes it difficult to ensure transparency and the accountability of the third parties that have a role in service delivery. Significant problems may occur if the government's capacity to manage indirect tools is not adequate. In such situations, these government tools may turn into a source of risk, as opposed to creating benefits to society. For example, when government agencies do not properly manage contracts with risky businesses or when government agencies do not regulate risky industries appropriately (both contracts and economic regulations are indirect government tools), the negative consequences could be dramatic for society.

An example of the type of tragedy that can be caused by poor contract management and regulation occurred in Turkey. In 2014, a coal mine collapsed in the Soma region of Turkey, killing 301 miners. The coal industry had mostly been under the control of two government corporations, TKI and EUAS. These corporations mostly contracted out mining operations to private companies across the country. The mine that collapsed in Soma region was contracted out to Ciner Holding in 2006. Between 2006 and 2009, Ciner Holding produced about 250,000 tons of coal every year. The company decided to transfer its contract to another company because of the high risk of methane gas and fire. The successor company, Soma Komur AS, increased coal production to 2.6 million tons in 2010. The company also reduced the per ton coal production costs from $140 to $23.8 at the expense of employee safety. The mine was inspected several times between 2010 and 2014 and passed all inspections without any problem. Even the Minister of Energy and Natural Resources visited the mine 9 months before the accident and praised the mine's safety and technology. The last time the mine was inspected was 4 months before the accident (Demiroz and Kapucu 2017). Moreover, TKI gave a purchase guarantee to Soma Komur AS, which means that the government would buy all the coal that was produced without a quota or limitation. Independent government agency reports indicated that Soma Komur AS delivered tons of coal below the designated calorie level; however, TKI continued buying sub-par coal. The government's poor contract management and lack of proper inspections and regulations created

incentives for Soma Komur AS to produce more coal at the expense of employee safety. The high risk at the Soma mine was a joint production of government agencies and private sector organizations (Demiroz and Kapucu 2017).

### Governance as Cross-Sector Collaboration

The second term that governance refers to in the context of disaster and crisis management is the coproduction of services with private and nonprofit sectors. The management of disasters and crises cannot be accomplished by any single government agency or program. When disasters and crises happen, their impacts are not bounded by jurisdictions. Rather, the complex and uncertain nature of disasters and crises requires actors from various backgrounds to collaborate to prepare for, mitigate, respond to, and recover from adverse impacts of natural and man-made hazards. For example, about 85% of the critical infrastructure in the United States is owned by the private sector (Government Accountability Office 2006). It is impossible to prepare for or prevent crises without collaborating with the private sector. Similarly, nonprofits also play important roles as support agencies during a disaster response. For example, the American Red Cross (ARC) and National Voluntary Organizations Active Disaster (NVOAD) are designated as support agencies for the Emergency Support Function No 6 (mass care, emergency assistance, temporary housing, and human services) in the third edition of the National Response Framework (Federal Emergency Management Agency 2016). Collaborative and interdependent relationships occur between local emergency management agencies and nongovernmental actors (e.g., private infrastructure companies and first responders) as well as between different nongovernmental actors (e.g., American Red Cross and school districts). As these examples indicate, the complex nature of disasters and crises requires government authorities to establish horizontal collaborative partnership networks with various actors across all sectors.

Kapucu and his colleagues (Kapucu 2008, 2012; Kapucu et al. 2010) use the term collaborative emergency management to define the complex and interdependent nature of crisis management. Collaborative emergency management is an extension of the collaborative public management field. Collaborative public management concentrates on coproduction of various services and solving complex problems using cross-sector partnerships. More specifically, Eugene Bardach (1998) defines collaboration as "any joint activity by two or more agencies that is intended to increase public value by working together rather than separately" (p. 8).

The use of collaboration in the context of crisis management is different than its use in other policy areas. During a crisis, collaboration includes coordination, information sharing, and even shared cognition depending on what phase of disaster management is being managed. For example, in the preparedness phase, various partners may get together to develop crisis response and relief plans. Such plans create a general understanding of how to act in times of crisis and create a shared mental map among partners. Various roles and responsibilities are distributed among partners, and they are expected to perform such roles in times of crisis. For example, in the United States, emergency management agencies prepare plans for coordinating crisis response. These plans identify several emergency support functions (ESFs), such as communication, sheltering, transportation, volunteer management, and search and rescue. For each of these support functions, the plans also identify primary and supporting agencies. For example, at the local government level, the local American Red Cross chapter opened and managed shelters. Usually, public schools serve as shelters in time of crisis, which require the American Red Cross to collaborate with local school districts in order to get access to school buildings. When a crisis occurs, emergency management agencies coordinate the activities of primary and support organizations as defined by respective ESFs.

The partnerships developed and used in hazard mitigation and disaster recovery have different characteristics than preparedness and response. Mitigation and recovery efforts are directed toward the elimination of social and physical vulnerabilities in communities. Economic development, urban development, social services, and

management of vulnerable populations are some of the key goals of partnerships developed for mitigation and recovery. Such partnerships have long-term goals and, unlike response activities, do not function in a limited time frame. For example, disaster recovery efforts can last for decades, and economic redevelopment (i.e., recovery) is an indispensable aspect of such efforts.

## Potential Challenges

Crises and disaster management systems are built upon networks of agencies from multiple sectors that work as equal partners for achieving a common goal. Networks are used in the delivery of a wide variety of services, including, but not limited to, mental health, social services, education, and disaster relief. Like other service delivery networks, crisis management networks are indirect government tools that are used to accomplish complex policy goals. It is important to note that there is overlap between governance as government capacity and governance as networks (i.e., indirect government tools). Government capacity is not limited to the capacity of bureaucrats or government agencies but also includes the management of indirect government tools. Managing network performance, ensuring accountability, and having harmony among participants in a network are challenging tasks for which there are no easy solutions. Every network is unique, and their effective management will require the use of different tools. Although networks provide flexibility to public officials for handling complex policy problems, they also pose challenges that are quite different than the challenges that posed by traditional government settings.

## Conclusion

Governance is a term that is used in many public sector areas. In the crisis and disaster management contexts, governance means (i) the government's capacity to execute its functions and (ii) the government's coproduction of services in collaboration with private and nonprofit organizations. The government's capacity to use direct and indirect tools for the delivery of services plays a crucial role in crisis management. When governments do not have necessary capacity to manage these tools, they can become a source of risk for their citizens.

Cross-sector collaboration is the second definition of governance, which also has important implications for crisis management. The management of crises and disasters is inherently a collaborative job. It is a multifaceted policy problem that requires significant contributions from all stakeholders (i.e., individuals, private companies, nonprofit organizations). Emergency management agencies strive to develop networks of stakeholders that can work as equal partners toward the effective management of crises events. Networks are widely used policy tools, especially in areas such as mental health and social services. However, it is not easy to management such networks. This is because networks are fluid, horizontally organized, and complex, as opposed to rigid, hierarchical, and relatively simple bureaucratic hierarchies.

## Definition

Analyzing external and internal governance in higher education in Europe and Greece. Trends and prospects.

## Introduction

Higher education is considered important for the socioeconomic development, both in the European and in the international level. The global socioeconomic developments led the educational systems, and especially these in the field of higher education, into extensive changes (Amaral et al. 2009). Such changes concern the increase of access into the higher education (e.g., in 2004, an amount of 132 million students entered the higher education, whereas in 1991 this amount was just 68 million students) (OECD 2008), the emergence of new forms of education (such as the remote education and the e-learning), the reconfiguration of the students' population-structure (concerning the increase of women participation, the socioeconomic and cultural heterogeneity, the deepening of the educational level, the increase of average students age), the promotion of internationalization in higher education, and the interest of the higher education institutions to the research and development aiming in the consolidation of innovation. At the same time, a tendency appeared in such institutions for self-financing support, which sets the conditions of their independence from the public funding (OECD 2010).

Such developments have led to the reconsideration of the concept of management in higher education and they have introduced a new approach, this of governance. Governance in higher education aims to succeed higher levels of effectiveness, to strengthen the cohesiveness of society, and to integrate the educational needs with the structure of the job market. Therefore, the decision of the most suitable governance models suggests a critical factor for the accomplishment of the higher education institutions' mission, which sets the configuration of the proper administrative environment into a major concern in the education policy's agenda targeting to high levels of organizational, administrative, and functional efficiency (FEIR 2017).

## Governance in Higher Education

The continuously evolving environment and more precisely the effect of globalization, the increasing

competition, the technological developments, and the intense changes in the labor market have led the systems of higher education to reconsider their managerial perspective and to develop a different approach, the governance, in order to improve their effectiveness, efficiency, and transparency. The theory of governance aspires to redefine the administrative reality. Conceptually, it refers to a modern administrative culture, which mainly determines the decision making and implementation processes and generally the administrative and organizational function. Governance seeks to combine the accountability and legality with efficiency and effectiveness (Karkatsoulis 2001). In the light of this new administrative system, the approach about the centralized administrative forms has been revised, promoting a new, more democratic, administrative perception. According to Stoker (1998), the essence of governance regards the administrative mechanisms being permanent in action, aiming to achieve an increasing performance of services, which is supported by autonomous and self-managed administrative networks. In the relative statement of the United Nations (UNESCO 1998), the concept of governance is acknowledged as the process through which public organizations, companies, and social groups interact (in order to promote their interests) and exercise their rights and obligations and they mediate in order to solve their differences. The components of the concept of proper governance are shown in Fig. 1.

According to the annual report of HQA (2016), the concept of governance in higher education includes the structures, the relations, and the processes through which the educational policies are developed, applied, and revised, both in national and in intra-university level. Thus, the conceptual complexity of governance is rather high, and it is composed by the legislative framework, the particular characteristics of higher institutions, the interconnection between the institutions and the educational system, the financing system, and the type of the financial and administrative control of these organizations (OECD 2008). Within this framework, governance suggests a modern administrative system aiming to improve the general function of higher education (OECD 2003). Through governance, the levels of effectiveness, efficiency, economy, and quality are increased, while the overall position of the educational institutions is strengthen, in an effort to support the human rights and to strengthen the transparency, legality, account, and meritocracy (COE 2018). Therefore, the system of governance introduces a new administrative reality ruling the most modern educational systems internationally.

## Analysis of the Higher Educational Institutes' Function

Governance in higher education is distinguished into external and internal, determining the total function of higher education. According to the European Commission (2008), the external and internal governance are further composed by

**Governance in Higher Education in Europe and Greece, Fig. 1** Determinative factors of a proper governance (UNESCAP 2009)

some elements described in more detail at the following sections.

## External Governance

The approaches of external governance in higher education vary among countries, and they are based on management systems from national and international bodies. National bodies may regard relevant ministries (such as the Ministry of Finance, Education), which undertake either the total responsibility for the higher education or partial administrative responsibilities (e.g., public policies, strategic planning) and economic duties (e.g., approval of budget, management of economic data). Indicatively, in Denmark three different ministries undertake the responsibilities depending on the type of the academic institution. In the United Kingdom, independent bodies have been established to distribute and to control distributed funds in order to avoid direct political control (European Commission 2008).

In most cases, the responsible ministries of education undertake to plan the public policies and generally the strategy for the higher education, either by configuring directly the strategic and developmental plans or by selecting the members composing the administrative bodies of the academic institutions. A particular mention should be made about the significant contribution of the national quality-assurance bodies, which they conduct evaluations and certifications, they set quality standards, and they guide the higher education institutions regarding quality issues. Also, each country has established a national body involving all the executive agencies, which is usually called the Conference or Council of the Rectors. Additionally to the national level, there are some international or regional bodies that have a significant impact on the external governance of the higher education, such as the European Commission, the European University Association (EUA), the Francophone University Organization, the Danube Region Rector's Conference, the University of European Capital Cities Network, the Rectors' Conference of the Universities of the Alpine-Adriatic Region (European Commission 2008).

An additional component of external governance is the external regulations of the higher education governance structures. Despite that most of the academic institutions are administratively autonomous, they are submitted to national or regional regulations (e.g., in Belgium, Germany, and Spain, the legislative powers for higher education have been transferred to the autonomous communities or federal states). In many countries, the official regulations are listed in the constitution or founding act of each institution. The effort needed for further reformation of the governance structures has been the subject of dialogue in many countries.

Another factor that significantly affects the configuration of the external governance is the external regulations for the institutions strategic planning. Provided that the academic institutions are autonomous, they are therefore responsible to accomplish their mission, within a particularly competitive environment with increasing social requirements. Thus, the strategic planning is more than necessary in order to determine the mission, the directions, the priorities, the vision, and the aims of the higher institutions. Within this context, the strategic approach facilitates the development of new conditions in the management of material, immaterial, and human resources (such as motivation, encouragement to participate in the academic and administrative personnel, configuration of new organizational culture, funding, funding management), while it attempts to promote the quality assurance and to focus on the information exchange systems. In most countries, the academic institutions are obliged to draw strategic plans (in some cases they should be coordinated with the current educational policy). On the other hand, there are countries where the academic institutions are not obliged to conduct strategic plans, such as the Francophone Belgium Community, the German-speaking Belgium Community, the academic institutions in the Flemish Belgium Community.

In spite of the fact that the institutions of higher education enjoy autonomy, since they receive public funding both the State and their sponsors have the legal interest to supervise their function. For this reason, the academic institutions have to

submit reports of their activities. However, both the way and the methods of submitting such reports differ among countries. In most countries, the submission of annual report is required, which is usually conducted and submitted to the ministry by the responsible executive body of each institution (e.g., the Rector, the Chairman, or the Director of the academic institution). Annual reports usually include data concerning educational activities, student, student-services, personnel, and relevant issues, public relations and international affairs of the institution, and many times budget issues that mainly regard the educational and other activities. For many countries, the annual reports include evaluation reports of the academic institution, an assessment for the institution's strategic planning, and some financial data (e.g., Portugal, Romania, and Norway). In many countries (e.g., Austria, Portugal, and UK), institutions also submit data for their strategies and their objectives.

Additionally, in many countries, the academic institutions are obliged regularly to keep the national databases updated with their activities, study programs, personnel, number of admissions, cost per student, etc. The national databases are used by the relevant ministries for the planning, supervision, and conduct of the academic institutions' budgets. Moreover, in other countries, the academic institutions are submitted to self-evaluation and they have publish their results, while some additional exchange information methods exist, such as (a) common meetings among representatives of the ministry, the educational institution, the funding body, and the job market, (b) public announcements through the Internet and Institutions library uploads, (c) quarterly budget reports, (d) reports on the study programs, and (e) external evaluation reports.

Table 1 shows various institutional planning and exchange information mechanisms in the public and sponsored by the state education for the year 2006/2007 (European Commission 2008).

## Internal Governance

In all the countries, the higher education institutions are autonomous entities and they have the main responsibility for their operation, economic management, activities, and personnel. The administration of the educational institutions was always implemented by the academic staff, the researchers, or the experts in the framework of collective management. Today, where in most countries the academic institutions have undertaken plenty of governance responsibilities, which previously belonged to the ministries, the administration structures of such academic institutions have been considerably changed.

Table 2 shows the main internal governance bodies of the public academic institutions and of those sponsored by the state. Cases of mixed composition (constituted by both external and internal bodies) are also shown.

According to Table 2, academic institutions in Europe have (a) an executive body, called Executive Director of the institution, (b) a collective Academic Body, usually called Senate or Academic Council, (c) a Decision-Making Body, which is responsible for the long-term and strategic planning and for the policy making of the academic institution, while it is also observed (d) a tendency to establish advisory or supervisory bodies, which supervise or observe the operational, educational, and economic activities of the academic institutions and they exclusively or mainly consist of external bodies. Obviously, in almost the one third of the countries, the Supervisory Body it is also the decision-making body.

More specifically, in the structure of the internal governance of the academic institutions, the Executive Director is, in the majority of cases, either the Rector or the Chairman of the institution, or in a few cases the Vice Rector of the institution. The Executive Director represents the institution in the legal transactions and the economic agreements, he is generally responsible for the strategic planning (such as the planning and development, organization, management, and supervision) of the institution, whereas he exercises his duties in close cooperation with the responsible governance bodies. The Executive Director is supported by an executive body, usually called Management Rectorship (or Deanery). This body is usually composed by the Vice Rectors, the Head of Administration, the General

Secretary, and the Economic Director. In most of the countries, the election system of the Executive Director is validated by the Academic Body of the institution. However, in Denmark and the UK, the institutional body that nominates the executive director is mainly composed by external institutions, whereas in Austria and in the Netherlands this body is composed exclusively by external institutions.

The Academic Body is mainly composed by members of the institution's academic staff, in which usually participate students' representatives and, in some cases (e.g., in France and Malta), some members that may not belong to the academic staff. Further, the Academic Body is primarily responsible for issues related to education and research, while in more than the half countries listed in Table 2, it has a relatively limited decision-making power, since the field of its direct competences does not include the policies, directions, or the strategic development of the academic institution. In the countries in which the Academic Body has not decision-making responsibilities, its mission is to take advantage of the knowledge and the experience of its members towards the university development. Furthermore, the Academic Body supervises the quality assurance procedures and the internal operational rules of the schools and their main departments, whereas in Bulgaria, Germany, and Cyprus the Academic Body has broader powers since it is responsible for the budget of the institution and for the internal allocation of funds.

The Decision-Making Body is in charge for the strategic planning, the general policy for the education and research, and the total growth of the academic institution, and it is usually empowered to approve or amend the statute and the internal regulation of the academic institution and most of the Executive Director's decisions. The Advisory/Supervisory Body (e.g., in Estonia, Spain, and Hungary) acts as an external guidance mechanism aiming to enrich the internal governance process with the experience of its external actors. However, there is no obligation for such a body to approve decisions, and thus, the main reason for its existence is to support the communication and cooperation between the academic institutions and the ministry, to promote closer links between higher education institutions and the society, and to improve the definition of guidelines and strategy with the support of external expertise.

Finally, there are also intermediate internal governance bodies of the academic institutions, as they are reflected in the structure of the governance of the main academic units, such as the

Faculty, the Department, the Institute. An intermediate administrative body is the institution of the Dean, who performs at the school level executive tasks comparable to those of the executive director, while at the level of the Department the management is conducted by the Chairman or the Director.

## Higher Education Governance in Greece

In most European countries, the governance of higher education systems is undergoing over the last 30 years a process of permanent restructuring, aiming at achieving a high level of efficiency capable of contributing to the fulfillment of its crucial role. A similar effort has been given in the Greek higher education recently. The strong impact globalization, the rapid technological changes, the increasing demand for high levels of efficiency, and the recent impact of the economic crisis in conjunction with the increasing competition have also led Greece to the need to incorporate a new public administration aiming to maintain the consistency with the international trends and developments (FEIR 2017).

Within this context, Greece has launched over the last decade some significant changes to the existing higher education governance system. Some of these changes, which have taken place since 2000 and they have significantly contributed to the configuration of the current governance environment in higher education, are shown in Fig. 2 and outlined below. In 2001, the Technological Educational Institutions (TEI) were integrated to the higher education of the country, under the form of the technological education sector (Law 2916/2001). In 2007, a substantial change in the governance system of higher education was attempted with the Law 3549/2007, by reducing the influence of the student factions on the administration of the academic institutions, in accordance with the provisions of the Law 1268/1982. In 2008, the framework for the organization and operation of postgraduate studies was revised, which led to an increase of the number of the postgraduate programs and students and to the consequent emergence of resources due to the establishment of tuition fees (Law 3685/2008). During this decade, the number of academic institutions was significantly increased through the establishment of new departments mainly in the region. In 2010, the minimum grade threshold 10/20 (the so-called "base of 10"), which was introduced in 2005 (with Law 3404/2005) for the admission to universities, was decided to be abolished with the next year's Law 4009/2011.

**Governance in Higher Education in Europe and Greece, Fig. 2** Time frame with the modern changes (after 2000) contributed to the current governance environment in higher education

In the period of the economic crisis, a particularly important restructuring effort was carried out, with the integrated intervention in the governance framework of the higher education. This effort was achieved through (a) the updating of the overall regulation framework of the higher education system and (b) the quality upgrading and the overall strengthening of the extroversion, operating under the standards of a new governance based on the fundamental principles of the modern public management (i.e. focus in the result, application of private economy criteria, use of methods operational management) (Rossidis 2014).

The adoption of Law 4009/2011 induced significant changes to the regulatory framework of the governance of higher education through: (a) the strengthening of the institutions autonomy, by transferring responsibilities from the State (Ministry of Education) to the administration bodies of the institutions, (b) the enhancement of the internal organizational flexibility (e.g., organization in schools with different curricula, distance learning), (c) the promotion of the administrative efficiency, by enhancing the decision-making process, (d) the establishment of private legal parties to manage the property and the research funds of universities, (e) the promotion of the internal accountability and funding transparency by linking it with the results achieved by institutions, (f) the enhancement of the internationalization of the academic institutions (h) the establishment of the national strategic planning for higher education by the Ministry of Education, and (i) the strengthening of the Quality Assurance and Certification Authority in Higher Education. In 2012, as a part of the implementation of the so-called "Athena" project, an inverse trend was promoted, which consisted of a merging act among higher educational institutions (Law 4076/2012). In the period 2014–2017, the restructuring efforts were limited to the complete abolition of the role of the student factions and to the abolition of the asylum (Law 4485/2017) legislation existed for the higher education institutions.

In the light of the these recent developments, the current system of governance in Greek higher education has gradually configured, having obvious influences from the international and European governance systems, but also many deficiencies in comparison with the prevailing European trends.

## Conclusions

Changes occurred in the management of the higher education institutions in the EU are many and multidimensional. Regardless of the individual differences between countries, we can observe a wider convergence of administrative restructuring. Among these common trends, some essential components of governance appear, according to the previous consideration (FEIR 2017), such as:

(a) The promotion of the strategic management and the further development of the academic institutions' autonomy, while establishing the obligation of accountability
(b) The improvement of the administrative organization, by reducing the bureaucratic rigidities
(c) The enhancement of the decision-making process
(d) The improvement of the funding efficiency through the commitment to achieving predefined goals
(e) The enhancement of institutions' internationalization perspective (e.g., the participation in international classification systems, the attracting of foreign students and research programs)

By comparing such trends at the European level with the case of Greece, we can observe that significant deviations exist, which mainly concern the Greek introversion, the high degree of dependency on the state administration, the inadequate use of the modern administrative methods and tools (e.g., the strategic planning, performance management, motivation methods), and the limited commitment to the evaluation procedures. However, the restructuring path of the recent years highlights a prospect of incorporating the successful governance practices into the Greek higher education, addressing some promising future aspects.

Overall, the way in which higher education is governed is directly related to the prevailing administrative perspective of each country, while it largely reflects the national objectives, not only from the educational policy but also from the wider socio-economic strategy. The dominant trend about the application of the modern public management principles is related with a culture emphasizing on the results, enhancing the administrative and organizational flexibility, and promoting the extroversion.

The development of such an administrative system aims to better serve the role of higher education institutions and to contribute decisively to the substantial improvement of the educational level. The development of such a system may lead to multiple long-term outcomes, as Austin and Jones (2016) rightly state. Under this perspective, the restructuring efforts at an international level focus on the development of parallel structures of internal and external governance, which will easily promote the missions of the higher education institutions, within a wider strategic higher education plan, a fact which verifies the claims of Shattock (2006). Trends in governance systems refer to the effort to develop higher education performance through practices that are more business-driven, by shaping strategic plans, linking funding to the results, promoting transparency and accountability, improving organizational structures and decision-making, etc (Zechlin 2008).

While Greece attempts to follow the current trend, it has undergone a period of intense change, showing significant progress, but it still has significant deviations from the European model, which highlights the need for further restructuring efforts.

## Governance in Tajikistan

Edward Lemon
Regional Studies, Daniel Morgan Graduate School of National Security, Washington, DC, USA

In the broadest sense, "governance refers to all processes of governing" aimed at "the creation of rule and order in social practices" (Bevir 2013: 1). Governance can be seen as a more encompassing phenomenon than government because it embraces not only governmental organizations but also informal, nongovernmental mechanisms (Rhodes 1996; Rosenau 1995). Governance as a concept is usually applied to denote more democratic forms of rule involving "decentralization, a people-oriented governance system, and enhancement of people's participation through networking governance" (see ▶ Governance Theories and Models). While democratic forms of governance govern through freedom, authoritarian governance is based on citizens' complete obedience to political authority (Dean 2010; Sigley 2006). Democratic forms of governance involve the devolution of power, allowing for the existence of counter-narratives from civil society and rival political parties. Authoritarian governance is highly centralized and attempts to maintain a monopoly on knowledge production. Unlike liberal governments, who view space as a source of economic, social and political competition, authoritarian regimes see space as a securitized resource that the state must closely control (Cerny 1997; Lewis 2015: 143).

Despite the efforts of foreign donors and civil society to stimulate Tajikistan's transition toward democracy and "good" governance, Tajikistan functions like a one-party state. President Emomali Rahmon has ruled the country since November 1992. When the country gained independence from the Soviet Union in 1991, it was the poorest post-Soviet republic with an economy based largely on agriculture and cotton production. Quickly the country fractured along regional lines and alone among the Central Asian republics descended into civil war between May 1992 and June 1997, which resulted in the deaths of between 20,000 and 50,000 people (see Epkenhans 2016; Heathershaw 2009). Rahmon, a collective farm head from the country's south who became head of state at the height of the civil war, reasserted government control, recapturing the capital city in December 1992. By mid-1993, the most intense period of fighting was at an end. Since then, Rahmon has slowly consolidated his regime (see Heathershaw 2009). Many outside observers view Tajikistan as a state characterized by weak governance and a brittle regime. But the regime has proved relatively resilient.

Johannes Gerschewski argues that authoritarian governance rests on three pillars: legitimation, co-optation, and repression (Gerschewski 2013). Governance in Tajikistan is based on all three. It involves a range of formal and informal measures involving state and nonstate actors at the local, national, and transnational levels. While government-backed governance aims to maintain the authoritarian system, although embattled, civil society still has the opportunity to push for greater transparency and accountability especially at the local level.

### Legitimizing Rahmon's Rule

The government has legitimized its form of governance through a combination of elections, constitutional amendments, and narratives about the appropriateness of its rule. The People's Democratic Party of Tajikistan (PDP) has dominated every election since the party was established in 1994. Although the 1994 Constitution and 1999 Law on Elections provide the basis for competitive elections and a multi-party system, elections

have been repeatedly criticized by the OSCE for "significant shortcomings." The PDP holds 51 seats out of the 63-seat of the parliament's lower house, the *Majlis Namayandagon.* Five nominally independent parties hold seats in parliament. But the government's most vocal opponents, the Social Democratic Party and Islamic Renaissance Party, have no seats. All 33 seats in the upper house, the *Majlis Milli*, are held by government appointees. The president appoints the governors of the country's four provinces (*viloyat*) and its 58 districts (*nohiya*).

Although he became Chairman of the Supreme Council and head of state in November 1992, President Rahmon was first elected to the presidency in 1994 with 59.5% of the vote. Five years later, he was re-elected with 97.6% of the vote. Since 2000, Rahmon has managed to strengthen the power of the executive through a series of constitutional amendments. In 2003, the government organized a plebiscite to approve amendments that would allow Rahmon to rule until 2020. Constitutional amendments approved through plebiscite in 2016 declared Rahmon to be "Leader of the Nation." This effectively allows him to rule indefinitely by abolishing term limits and grants his family lifelong immunity from prosecution.

Contemporary Tajik politics cannot be understood without reference to the civil war. Although critical discussion of the war itself remains limited, government officials frequently refer to the potential of a return to "suicidal war" (*jangi khudkushi*) if the government's rule is challenged. President Rahmon has been officially styled the "Founder of Peace and National Reconciliation" through the 2016 constitutional amendments. Officials have effectively erased the role of the opposition, and external agents including Russia, Iran, and the Organization for Security and Cooperation in Europe (OSCE), in negotiating the war's settlement. State media and the education system portray Rahmon as the nation's father, a benign ruler who has brought the country out of chaos and is leading it to a bright future (Mostowlansky 2013). A cult of personality has begun to develop around the president. State television airs documentaries glorifying the president's achievements, the state media are legally required to use his full name, "The Founder of Peace and National Unity, Leader of the Nation, President of the Republic of Tajikistan, His Excellency Emomali Rahmon," and billboards around the country display his public messages.

The government has also encouraged citizens themselves to become engaged in governance and public life. But instead of being involved in decision-making and holding officials accountable as in more democratic models of governance, through the involvement of citizens the government usually aims to re-enforce its own power and authority. Through education and indoctrination via the state media, the government aims to produce citizens who monitor others, and themselves, for the signs of radicalization and dissenting views (Lemon and Thibault 2018). These "model" citizens act as defenders of national culture. The government has encouraged citizens to monitor each other's online activities, co-opted students into protesting against foreign governments who have given asylum to political exiles from the country and held scripted meetings between the public and government which given the impression of accountability.

## Co-opting the Elite

Tajikistan is a nepotocracy, a state in which governance of the economy and politics is dominated by members of the president's extended family. Efforts by civil society to promote transparency and accountability within the government have faced resistance from the government. Like other post-Soviet states, Tajikistan conforms to Henry Hale's concept of "patronal politics." According to Hale, "patronal politics refers to politics in societies where individuals organize their political and economic pursuits primarily around the personalized exchange of concrete rewards and punishments through chains of actual acquaintance" (Hale 2014: 9). Networks of patronage based on kinship, regional, or other ties form the center of politics in Tajikistan. Tajikistan is a "single pyramid" system with President Rahmon sitting atop as the ultimate power broker.

When Rahmon came to power, he was in a position of relative weakness, although he had a powerful patron in Sangak Safarov, a convicted murderer and warlord from Kulob in the country's south. The northern elite hoped they would be able to sideline him. But Rahmon proved an adept political player. He incorporated those who placed him into power into his government, and then offered 30% of government posts to the opposition as part of the 1997 Peace Accord. But slowly he pushed the former commanders and powerbrokers out of the regime, arresting, killing, or exiling them (Driscoll 2015). In their place, politics in Tajikistan has come to be dominated by members of Rahmon's family and his kin from Danghara, his hometown in the country's south.

Emomali Rahmon has an extensive family, with seven daughters and two sons. His son, 30 year-old Rustam Emomali, was appointed mayor of the capital city Dushanbe in January 2017. Many analysts expect him to be the chosen successor to his father. The 2016 constitutional amendments also lowered the age a candidate can stand for election as president from 35 to 30, allowing Rustam to run in the next election scheduled for 2020. Rahmon's daughter Ozoda is the chief of staff in the president's office. Other members of the extended family control important sectors of the economy. Rahmon's brother in law, Hasan Asadullozoda, owns the largest private bank and airline. Ozoda's husband, Jamoliddin Nuraliyev, is deputy director of the National Bank. Faroz, which has significant investments in pharmaceuticals, mining, tourism, and energy, is controlled by the Sohibov family, which is related through marriage to Rahmon.

The elite have engaged in kleptocratic practices, leveraging their relationship with the state to amass private fortunes. Far from being a backwater, Tajikistan is well-integrated into transnational flows of capital. Tajikistan experienced an estimated capital flight of over 60% of its GDP in 2011, according to the IMF. The Talco aluminum smelter, the country's largest industrial enterprise which accounted for 48% of export revenues, is controlled by Talco Management Ltd., a shell company registered in the British Virgin Islands under president Rahmon's direct control (Heathershaw 2013). The toll road between the country's two main cities, which generates over $200 million each year in revenues, is controlled by another offshore shell company Innovative Road Solutions, linked to the president's son in law Nuraliyev. As well as taking advantage of secretive tax havens the elite have generated rent-seeking opportunities from foreign donors. Murodali Alimardon, who headed the National Bank from 1996 to 2008 and now controls the country's largest bank Agroinvestbank, distributed $854 million ($241 million given to it by the IMF) in uncollateralized loans between 2004 and 2008 through private bank KreditInvest, with much of the money going to the cotton sector. Kreditinvest was established in 2004 as a subsidiary of Agroinvestbank, controlled by Alimardon. While using KreditInvest to generate profit from interest payments by cotton farmers, he loaned $116 million to HIMA, a cotton company he was rumored to own, none of which was paid back. Through such practices, the elite enrich themselves and their networks, creating incentives to maintain the status quo.

## Governance Through Repression in Tajikistan

Governance in Tajikistan also relies heavily on repressive measures. Tajikistan's judicial system remains highly politicized. Laws are used selectively to target opponents. Trials of political opponents take place behind closed doors and the proceedings lack transparency. Charges are often fabricated against individuals. Torture by law enforcement remains widespread. The government has adopted amorphous definitions of "extremism" and "terrorism," allowing it to justify its crackdown on independent voices in the name of counter-terrorism. Adopted in 1999, the "Law on the Fight against Terrorism" defines terrorism as: violence or the threat of violence against individuals or legal entities [. . .] actions which have socially dangerous consequences and are implemented with a view to violating public security. Legislators do not elaborate on what "socially dangerous" or "public security" mean. Crimes

that are considered "extremist" under the 2003 Law on Extremism include insulting national dignity, unsanctioned rallies, and calling for the overthrow of the government.

Authoritarian governance in Tajikistan rests on the government's attempts to control the flow of information. With 17% of Tajiks now using the internet on a regular basis, the state-run Communications Service regularly blocks websites that criticize the regime. Libel laws and accusations of corruption have been used by the government to target independent journalists, resulting in a widespread culture of self-censorship. The government is particularly concerned about the flow of information about Islam, which 98% of the population professes to practice. In April 2017, the Ministry of Culture decreed that no books are allowed in or out of the country without its permission. Access to Islamic education has also been curtailed by the government. Studying Islam abroad has required permission from the Ministry of Education since 2011. While 19 madrassahs operated in the country until 2009, the government refused them registration and then finally announced the closure of the country's last maddrassah in September 2016.

The government has created a division between "good," state-sponsored Islam and "bad," unofficial, extremist Islam. Since 2014, the government has paid imams a salary, and imams are required to read sermons prepared by the authorities. While the state sponsors its own form of Islam, it has cracked down on believers whose practices are not under its direct control, labelling them "extremists." A 2009 Law on Religion places restrictions on the registration of religious organizations, opening of mosques and access to religious education. Using the law, for example, the State Committee for Religious Affairs closed 1938 mosques in 2017. The 2011 Law on Parental Responsibility bans under 18 s from praying in mosques with the exception of funerals. Officials have also dissuaded citizens from displaying signs of piety, framing this as "foreign" to national culture. Hijabs and beards have formed the most visible targets of the government campaign. In 2007, the Ministry of Education adopted a decree to prohibit women from wearing hijabs in educational institutions and in 2015 the mayor of Dushanbe instructed a ban on the import of "foreign clothing." Such formal measures coexist with more informal measures adopted by local law enforcement officers. Since 2010, men with beards have reported being forcibly shaved and accused of being "extremists" by police. In January 2017, officials in Khatlon claimed to have "encouraged" 13,000 men with beards to shave, to have closed 160 shops selling hijabs, and to have convinced 1773 women to stop wearing the hijab. Over 8000 women in hijabs were stopped in early August 2018 in the capital city Dushanbe and told to remove their headscarves.

The government has also repressed registered political parties. Formed in 1973 in southern Tajikistan by five Islamic activists, the Islamic Renaissance Party of Tajikistan, as it would become in 1991, fought with the opposition during the country's civil war. As part of the peace process, the party was legalized in 1999, winning two seats in the parliament's lower house, the *Majlis Namayandagon,* the next year. At its height, the party claimed over 50,000 members and officially secured 8.2% of the popular vote in the 2010 parliamentary elections. Party leadership consistently declared their commitment to democracy and secularism, particularly after Muhiddin Kabiri became leader in 2006. Nonetheless, the party came under intense pressure from the government. In the 2015 elections, it lost its two seats in the *Majlis Namayandagon,* officially securing just 1.6% of the vote. The Supreme Court declared the Islamic Renaissance Party a "terrorist organization" in September 2015 following what the government described as a coup attempt by former deputy defense minister Abduhalim Nazarov. In the aftermath, hundreds of party members, including 13 members of the party's Supreme Council, were arrested.

This repression has not stopped at Tajikistan's borders. Thousands of journalists, academics, and opposition activists have fled the country in recent years. In 2017, for example, 3320 Tajiks applied for asylum in the European Union, up from 605 in 2014. Since 1993, the government of Tajikistan has targeted at least 73 of its citizens living abroad, subjecting them to harassment,

intimidation, attack, detention, kidnapping, and assassination (Lemon and Thibault 2018). Most incidents, 49 in total, occurred in Russia, with a further 14 in Turkey. The government has also used international organizations to pursue opponents in exile. Tajikistan has 2528 citizens on Interpol's wanted list, one of the highest per capita in the world. As many exiles have found sanctuary in Europe and North America, the government has targeted their relatives, denying them medical treatment, seizing their property, and confiscating their passports in an effort to pressure the exiles into returning home.

Governance in Tajikistan also entails restrictions on civil society more broadly. Following amendments to the Law on Public Associations, all nongovernmental organizations must report foreign funding to the Ministry of Justice. The government uses the Tax Committee and Labor Regulator to place pressure on NGOs working on sensitive topics such as human rights. Following the introduction of a new licensing system by the Ministry of Justice in 2015, the number of registered lawyers in the country has fallen from 1500 to 600.

## The Curtailed Space for Civil Society

Governance is not fully centralized in Tajikistan. Although it operates within an increasingly restricted space, a civil society consisting of 378 independent media outlets, 2773 registered nongovernmental organizations, entrepreneurs, religious organizations, and community-based organizations provide services, conduct advocacy, and attempt to increase government accountability (see ▶ Civil Society Organizations, ▶ Community-Based Organizations). Community-based organizations have worked with government agencies to support those with HIV, provided gender expertise to the Migration Service, lobbied to have new legislation to protect victims of domestic violence and people with disabilities, documented human rights abuses by law enforcement, reported on bribe-taking resulting in officials being fired and established online platforms for citizens to report problems to local government, to name just a few noteworthy initiatives. Not all development assistance has created a more accountable and transparent government; assistance to the security sector, for example, has arguably strengthened the government's coercive power. While efforts to create system-wide changes in governance have proven difficult, civil society has managed to promote more transparent and accountable governance practices in certain local contexts where government officials have been more receptive.

Since 1991, international donors have provided assistance to Tajikistan as part of their efforts to assist former Soviet republics in their transition to pluralism and free market economies. Official Development Assistance totaled over $1.4 billion by 2014, equivalent to 3% of the country's gross domestic product. But as in the rest of the world, development assistance from non-OECD states is on the rise. China has also become a leading development partner, offering $270 million in grants and concessionary loans to fund infrastructure projects between 2007 and 2015. Saudi Arabia has given $200 million in aid since 1991, recently building new training facilities for the Committee on Emergency Situations and pledging to construct 66 new schools. Qatar is funding the construction of Central Asia's largest mosque. Such donors do not have the same governance-based conditionality attached to their assistance. Coupled with the scale of assistance on offer, such interventions will likely serve to strengthen authoritarian governance in Tajikistan.

## Conclusion

Twenty six years after gaining independence from the Soviet Union, Tajikistan is a consolidated authoritarian regime. Rather than being characterized by decentralization and the increased role played by non-state actors in taking decisions on matters of public concern, the government of Rahmon has slowly centralized power on the executive through legitimation, co-optation, and repression.

This system of authoritarian governance has become relatively entrenched. Fear of a return to civil war keeps much of the population quiescent.

Efforts by civil society actors to stimulate good governance practices within the government and to involve citizens more actively in public life have faced resistance from the regime with some notable successes at the local level. At the same, the government has largely failed to offer economic opportunities to its population. Migration to Russia provides the best opportunities for many young Tajiks; remittances sent from abroad were equivalent to 30% GDP in 2017. With Rahmon's son, Emomali Rahmon, being groomed to take over, this situation looks set to continue. But this is in no ways inevitable. Shavkat Mirziyoyev, who became president of Uzbekistan in 2016 after the death of Islam Karimov, who had ruled since 1989, has introduced reforms aimed at slowly opening the economy to investment and improving governance. The potential success of these tentative moves may influence the government of Tajikistan into improving its governance practices and increasing the role of citizens in public life. At present, the country's trajectory is in the opposite direction.

# Governance in the Dutch Caribbean

Genève Phillip-Durham
University of St. Martin, Philipsburg, Sint Maarten
University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Caribbean; Governance; Netherlands Antilles; Small island developing states; Sub-national island jurisdictions

## Definition

The notion of governance alludes to the movement and inclination toward a minimalist state which began in the mid-twentieth century. It can be defined as a multilevel process which involves the networking of government or state enterprise, private sector, and civil society to administer resources within a jurisdiction and simultaneously manage the political economy of development.

## Introduction

Prior to October 10, 2010, governance and administration in the Dutch Caribbean had been customarily studied on a macro-level, with attention paid

primarily to what took place in the Willemstad capital of the Netherlands Antilles, situated in Curacao. However, the dissolution of the country previously known as the Netherlands Antilles in 2010 resulted in a new political status for the territories of which it comprised. The smaller islands, Bonaire, St. Eustatius, and Saba, became municipalities within the Kingdom of the Netherlands, while the larger islands, Sint Maarten and Curacao, became constituent states. This arrangement warranted not only the revisiting of the administrative structures but also the way in which governance practices and processes were executed, particularly in Sint Maarten and Curacao, which successfully negotiated for greater autonomy from the Netherlands than their significantly smaller counterparts. The protracted autonomy among the BES islands was inevitable, as they became constitutionally integrated into the Netherlands, inheriting Dutch laws and the Dutch administrative structure. These new developments called into question the meaning invoked in the term governance, when assessed against the backdrop of varying degrees of sub-nationalism and autonomy, as experienced by the territories in question.

## The Kingdom Charter and Its Implications for Governance

The modus operandi for governance within the Dutch Kingdom is legally enshrined in the Kingdom Charter of 1954. Governance and administration within the Kingdom of the Netherlands, in what can be referred to as the pre-dissolution era, were shaped on the central level, by much of the discussions that were ongoing in The Hague, Netherlands, and on the local level, by conversations taking place in Willemstad, Curacao. By the turn of the twenty-first century, it became increasingly evident that the structure of the Kingdom was regarded as untenable and unfavorable to the progress of all partners within the Kingdom. As such, the failure of the old structure to appease the interests of all stakeholders contributed to the reassessment and reevaluation of the relationship among them. This reassessment ushered in accelerated discussions, relating to questions including but not limited to autonomy, independence, governance, and administration. According the Veeneendaal (2015: 20):

> Whereas the Charter of the Kingdom legally entrenches. . .autonomy. . .thus largely preventing Dutch political intervention – the Charter simultaneously identifies the safeguarding of human rights and good governance as a responsibility of the Kingdom as a whole. Mounting Dutch frustration with this equivocal state of affairs and enduring financial and economic problems on the islands resulted in a yearning for more political tools to intervene in the case of perceived problems in the sphere of good governance.

In order to glean a thorough understanding of the governance outlook in the contemporary context of the Dutch Caribbean, it is important to look at the evolution of the constitutional framework which governs these territories as a point of departure. The Charter for the Kingdom of the Netherlands in principle and practice provides the basic framework for how government and administration operates within and across the Kingdom. Amendments to it can only be agreed upon where consensus exists among *all* the territories within the Kingdom. The dissolution of the Netherlands Antilles on 10.10.10 radically altered the governance landscape in the Dutch Kingdom and by extension, the Dutch Caribbean leading to the emergence of many new administrative and governance systems and structures. The amendments to the Kingdom Charter which were forthcoming at the time of 10.10.10 gave way to greater political autonomy for Curacao and Sint Maarten to conduct their own internal administrative and governance affairs, while curtailing the freedom of the BES islands to do the same. However, matters of common interest such as defense, international relations, and the judicial system would continue to be jointly addressed at the level of Kingdom government.

## Amendments to the Kingdom Charter and Its Implications for Governance

Based on the premise that greater direction and structure would be needed in order to effectively govern their internal affairs, developing their individual constitutions became the preoccupation of Curacao and Sint Maarten. Notwithstanding their

newly attained political autonomy, however, the Kingdom Charter superseded the Constitutions of both Curacao and Sint Maarten, as well as Aruba, another Dutch Caribbean territory, which attained its autonomy from the Netherlands since 1986. Though the term governance alludes to a process wherein government operates *along* with other key stakeholders, in the context of many Caribbean small island developing states and subnational island jurisdictions, governments continue to maintain a key position in dictating the governance structure and by extension governance outcomes. Such was also the case in the context of the Dutch Caribbean territories, following the dismantling of the Netherlands Antilles.

The level of enthusiasm among local politicians to finally be able to govern their own affairs eclipsed the need to involve private stakeholders and civil society groups in key decision-making processes which would have implications for the successful governance of the territories. What quickly followed the dominance of the government and state enterprise in the governing process on the island level was the increased supervision of decision-makers in The Hague, stemming from allegations of corruption, mismanagement, maladministration, and bad governance in the newly autonomous territories.

In the view of the Dutch authorities, for example, there was much mismanagement of internal administrative affairs on the island of Sint Maarten since 10.10.10, and the Committee of Financial Supervision became one of the tools which would be used to curb it. This was also the case with Curacao which came under immense scrutiny by policy makers in the Netherlands that were preoccupied with the state of internal governance and administrative practices on the island. The CFT is a financial supervision law which came into effect via The Hague, in the aftermath of Curacao and St. Maarten gaining autonomy. Its principal aim has been to monitor the territories' handling of internal budgeting and financial matters. In the words of Minister Plasterk, Dutch Minister of Home Affairs and Kingdom Relations, the financial supervision law was in the "best interest of the countries" (www.thedailyherald.sx). It is important to note that since 10.10.10, the autonomous territories have attempted to have the approval for consecutive budgets, none of which have been fully approved by the Committee of Financial Supervision (CFT), the latter citing ongoing concerns and challenges related to the achievement of good governance.

## Revisiting Governance in the Post-Dissolution Era

Prior to 10.10.10, there was sufficient evidence to suggest not only that a great degree of stability existed in the realm of governance but also that the political economy of development in the non-independent Dutch Caribbean islands had far outpaced that of their counterparts in the Anglophone Caribbean as well as in other independent jurisdictions across the region. This was often attributed to the influence of the metropolitan Netherlands in the region and the ability of the mother country to implement and sustain stability and structure, specifically where matters of governance were concerned. Cementing this trend of thought, scholars with an interest in the study of small island territories and subnational jurisdictions such as Giacalone (2001), Ramos and Rivera Ortiz (2001), and Bishop (2009) have noted that Caribbean non-independent territories have enjoyed a relatively higher standard of living than the independent nations in the region. Certainly, the tutelage of metropolitan rule has helped them, a point which Ramos and Rivera Ortiz (2001: xiv) stresses by stating that "the developmental upswing of metropolitan powers was extended to their territories. . .most colonies have reached a developmental level that distances them from the neighbouring independent societies." After 10.10.10 however, this pattern of growth and development took an unprecedented downward turn, amidst mounting pressure from The Hague to get governance right on the island territories of Curacao and Sint Maarten.

In a recent study of governance in the island territories of Curacao and Sint Maarten, it was noted that the conversations about governance in Sint Maarten were dominated by sentiments of lack of agency and "the political dominance of the metropolitan Netherlands" (Veenendaal 2015: 16). Concern was also expressed over the fact that

Curacao's dominance in the old constitutional and political order had left Sint Maarten in a disadvantageous position post-10.10.10, since administratively, almost everything was done in Curacao prior to the dissolution. Having served as the administrative headquarters of the country of the Netherlands Antilles prior to the dismantling, Curacao possessed many of the requisite structures and systems in place to make the transition to an autonomous constituent state. In Sint Maarten, for instance, 76% of the research participants expressed the view that they were much less equipped than Curacao to deal with the increasing demands that came with their new status due to a lack of experience and familiarity. According to one research participant, 10.10.10 produced a setting where local actors on the island of Sint Maarten were still grappling with the complexities of understanding governance in a new constituent state and the implications of the same for establishing and sustaining proper administrative structures.

Notwithstanding the ongoing reprimands and words of caution from The Hague, since the dissolution of the Netherlands Antilles, the governance systems and structures, namely, in the two territories, Curacao and Sint Maarten, have become cumbersome and in some cases evidently chaotic and messy. Though Curacao was seemingly better poised to manage its own affairs, the fact that consecutive governments had fallen apart in both Curacao and St. Maarten, in both cases, at least five times over a 6-year period, made this postulation questionable. While there have also been challenges in St. Eustatius, Saba, and Bonaire, with strong sentiments being expressed about the curtailment of their freedom with the new political arrangement, their constitutional status as municipalities meant that the Netherlands had a greater measure of control over them and was better able to manage, monitor, and influence the way in which governance was practiced.

## Conclusion: Why Have Administrative and Governance Challenges Prevailed Since 10.10.10?

One of the first tasks to be undertaken as constituent states was to decide how the territories would manage their administrative systems and economy, for the first time, outside of the relationship with its former Antillean counterparts. In theory, the newly acquired constitutional status meant that administrative and economic matters in Curacao and Sint Maarten were no longer to be a concern of the Netherlands, since matters of internal affairs were to be carried out autonomously by their respective governments (Romney 2013). However, in practice, The Netherlands became preoccupied with addressing issue areas that went beyond the scope of the Kingdom Charter, seemingly stretching the limits of what it meant to uphold "proper administration" Kingdom wide (ibid: 3). Amidst the pressures coming from The Hague, the contention in the newly autonomous countries was that they were constantly being denied the opportunity to define their own destiny and autonomously determine the policy paths they would pursue in order to achieve good governance and stabilize their economies.

In addition to this, public administration was largely executed by civil servants from the Netherlands, a situation which became the source of much frustration for local civil servants (Veenendaal 2015). However, the fact that successive governments continued to collapse made it increasingly difficult to convince Kingdom partners on the other side of the Atlantic that the territories were capable of sustaining administrative and governance mechanisms that would yield positive outcomes for the autonomous territories. On the one hand, it was clear that with the exception of the BES islands, the territories no longer wanted to be subordinate to the Netherlands or regarded simply as appendages of their metropole. On the other hand, however, the need to be continuously supervised and monitored was reaffirmed by consistent blunders at the government level, which also made it virtually impossible to incorporate stakeholders at the private sector and civil society level that could positively contribute to the overall governance process. The future of the governance and administrative landscape in Curacao and Sint Maarten is largely dependent on the ability of the newly elected coalition governments in 2016, to survive until elections are constitutionally due. Undeniably, a stable government would be able to forge and

sustain a meaningful relationship with other stakeholders that are crucial to the overall governance process.

# Governance of Disaster Management

Ivano Bongiovanni[1] and Denis Fischbacher-Smith[2]

[1]PwC Chair in Digital Economy, Queensland University of Technology, Brisbane City, QLD, Australia

[2]Adam Smith Business School, University of Glasgow, Glasgow, Scotland, UK

## Synonyms

Disaster governance; Disaster risk reduction; Governance of emergency management

## Definition

The governance of disaster management encompasses a broad range of public, private, and not-for-profit organizations, international institutions, national and transnational regulations, guidelines, and practices intended to guide concerted actions to prevent, prepare for, respond to, and recover from man-made and natural disasters, by limiting their consequences or reducing their likelihood.

## Introduction

The current century has seen the convergence of a number of extreme events, to the point in which the concept of disaster has become one of the defining tenets of our age (Fischbacher-Smith 2006). Events in 2017 highlighted the nature and scale of the problem as Hurricanes Harvey and Irma devastated large parts of the Caribbean and the US states of Texas and Florida. Both of these disasters, which occurred within weeks of each other, highlighted a range of governance issues across three stages of these events. Prior to a disaster, there is a need to ensure that plans are in place to deal with the task demands that can arise from the consequences associated with particular threat vectors. The key governance challenge here relates to the ways in which the worst case scenario is considered within the planning process. Many organizations will deny the worst conceivable case, arguing that there is no a priori evidence for such an outcome. Such a constrained view of the potential consequences of a catastrophic event can have significant impacts on subsequent attempts at mitigation. This was evident in the aftermath of Hurricane Irma where there were allegations that governments were ill-prepared to evacuate their citizens who were caught up in the disaster and where other governments refused to evacuate the citizens of other countries. There are also governance issues during the active phase of a disaster. There are, for example, significant challenges for local government and law enforcement in maintaining law and order under such conditions along with the provision of emergency care for victims. Finally, the aftermath of the disaster inevitably raises a series of questions around organizational learning and the processes by which issues of accountability are dealt with. These natural hazards illustrate the complex interconnections between the concepts of risk, vulnerability, disaster, and crisis and the processes

and principles of governance can be seen to permeate all of these terms. The governance issues that are raised concern the role that expert judgment plays in the prediction of hazardous events, the effectiveness of pre-disaster planning on mitigating the effects of any catastrophe, the effective communication of the hazards to those people deemed to be "at risk," and the transparency of the calculative processes that are used to assess the nature, likelihood, and consequences of any catastrophic event (Smith 1990, 2005).

Traditionally, societies have approached disasters and major emergencies in different ways and this has been shaped by a number of factors including religion, cultural influences, and a range of vulnerability factors. A fatalistic view of disasters prevailed for centuries, as natural hazards were conceived of as *acts of God*, against which human action was considered futile at best. The *Enlightenment*, with its secular view of the world, gave rise to a different perspective on the origins of disasters, one that conceived them as *acts of nature*. This new approach led to the diffusion of some forms of what is called today *disaster management*, and involved actions to mitigate the impacts of a disaster by means of improved engineering techniques. The social conception of disasters (Dynes 1999) emerged in the mid-twentieth century, when natural disasters started to be conceived as *acts of society*. From such a perspective, and as a direct or indirect product of human activities, disasters could be magnified in likelihood and consequences by human actions, such as building non-earthquake proof facilities in seismic areas or settling in floodplains (Quarantelli 2000). With the raising of awareness that disasters were not solely acts of God or nature, there came the necessity for humans to engage in direct actions to deal with the task demands that they generated. Institutional responses aimed at mitigating, and responding to, large-scale events affecting significant portions of populations were eventually perceived as a requirement for well-managed organizations and government bodies. An early example of such a response was the creation of organizations whose main objective was the protection of civilians from the hazards of wartime, and especially the use of nuclear weapons (see, for example, *Civil Defense*, Groven et al. 2012). During the latter part of the twentieth century, however, and with the growing role of the so-called civil society, increasing efforts were concentrated on supporting populations affected by natural as well as human-generated calamities from within the communities themselves.

At the same time, public and organizational awareness around the toll exacted by disasters has increased. The UNISDR estimates that economic losses deriving from major disasters range nowadays between US$250 and 300 billion every year (UNISDR 2016). This dramatic situation is likely to be exacerbated in the near future, mainly due to the interaction of several trends including: rapid economic development resulting in environmental degradation, progressive concentration of populations in relatively smaller areas (urbanization), exacerbation of socioeconomic inequalities, and the pace of climate change. In the light of these alarming dynamics, key actors are asking for more effective governance provisions to support them with channeling even scarcer resources and their deployment into those areas where they are needed the most. These decisions have the potential to change the shape of the consequences associated with any catastrophe but they can also increase them. As a result, it is important that effective governance arrangements are in place to ensure the transparency and accountability that is required.

## Disaster Management: A Governance-Based Analysis

In liberal democracies, the safety of citizens is traditionally considered to be a function provided by the state and is, therefore, one of the priorities of both central and local government. Public organizations play a threefold role when it comes to risks and disasters (Drennan et al. 2015). As *regulators*, public organizations are required to establish protocols that are intended to shape the ways in which individuals and businesses engage in a range of activities, some of which may be deemed to be hazardous (e.g., urban planning to regulate

the types of buildings that can be erected in disaster-prone areas). Public organizations also play a role as *stewards*, or the insurers of last resort, where they are in charge of loss compensation in case of events for which responsibility cannot be immediately specified (e.g., an earthquake; Drennan et al. 2015). Finally, public organizations play a key role as *managers*, where they organize risk management activities and resources intended to mitigate the impact of events that individuals and businesses cannot normally face on their own (Drennan et al. 2015). It is worth noting that, while playing a key role in the response to the task demands of disasters as both rescuers and agents of recovery, public organizations can also generate some of the conditions that could escalate the impacts of a disaster through poor preparation and planning (Smith 2005).

Modern disasters are complex phenomena that escape a strict taxonomy (Quarantelli and Perry 2005). The complexity of modern disasters unfolds at different levels. These include: *etiological* (e.g., natural or man-made disasters, safety-related or security related, slow- or sudden-onset); *geographic* (local, national, or transnational disasters); (Quarantelli and Perry 2005; Turner and Pidgeon 1978) *developmental* (pre-disaster, disaster, and post-disaster phases; Smith 1990, 2005); and *socioeconomic* (e.g., the underlying vulnerability of the affected populations). There has been debate, for example, as to whether the term disaster should be reserved for those catastrophes that have a significant physical trigger rather than a socio-technical one and the distinction can be used to determine which agencies are responsible for managing the catastrophe. However, the term is commonly used to describe both types of event, irrespective of the nature of the triggering process. The degree of complexity of modern disasters requires flexibility in the approaches taken to manage them, and a concerted effort needs to be orchestrated by a variety of actors. Monolithic responses invariably prove to be inefficient in providing adequate relief and there is a need to bring together a range of resources in order to deal with the task demands that a catastrophe generates. Collaborative responses involving an enlarged spectrum of stakeholders have been demonstrated to be more effective than more narrowly configured approaches. In common with other forms of public management, the protection of citizens from calamitous events has progressively shifted away from increasingly under-resourced public sector organizations to both private and not-for-profit actors. This has intensified the need for those involved to be more effective in harmonizing their efforts by shifting the focus from the basic delivery of disaster relief services towards a more coordinated organization of disaster management activities. In a self-reinforcing loop, this has led to the development of the humanitarian industry, nurtured in turn by a significant growth in number of humanitarian agencies (in particular, from the 1980s through the year 2000; Calvi Parisetti and Kiniger-Passigli 2000).

Other trends such as globalization and technological innovation have also produced a new set of hazards and, through the increased dependence on extended supply chains, have increased the distances over which they have to be managed (Fischbacher-Smith and Smith 2015). This has forced contemporary disaster management governance models to reshape and constantly adapt to deal with the changes in the threat matrix. Because the world is more interconnected, it enables improved communication among the involved stakeholders, resulting in prompter mobilization of resources to face localized emergencies. In contrast, this causes the center of gravity of disaster management to constantly move all the way from the local, through the national, to the global level and back. This can have the effect of consuming resources in coordination efforts and multiplying the challenges of duplicating decision-making, generating a slow response to the disaster, and perpetuating ill-defined roles and unclear responsibilities. The resulting picture is of "an amalgam of loosely related regulatory instruments, policies and processes, with a 'yawning gap' at its core" (Lane and Hesselman 2017, p. 94) which denotes a certain inadequacy of present day disaster governance architectures. The "glue" of such architectures is constituted by a range of frameworks, processes, and

mechanisms which vary in nature from entirely voluntary to legally binding.

It is possible to summarize some of the most relevant trends at different levels of granularity from the global to the local. At each level, the issues of governance generate different challenges for the ways in which disasters are managed.

### Global

The globalization phenomenon and the exacerbation of modern natural disasters have led to an increasing need for societal and international assistance in case of large-scale calamities. International and global institutions such as the United Nations (e.g., the UN Office for Disaster Risk Reduction – UNISDR, established in 1999 or the UN Office for the Coordination of Humanitarian Affairs – OCHA, established in 1998) and the World Bank (e.g., the Global Facility for Disaster Reduction and Recovery – GFDRR, established in 2006) have become fundamental actors in the discussions and practices around disaster governance, and especially with regards to the assistance for developing countries. When effectively incorporated into the context of development aid, then the processes of governance at the global level cover a wider spectrum of stages in the hazards cycle. They also provide a more complete coverage of the various disaster sectors, as they provide developing countries with resources to effectively prepare for, face, and respond to the many aspects of disaster mitigation and response. Launched by the UN in 2005, the "cluster approach to disaster response" (Lane and Hesselman 2017) revolves around the idea that different humanitarian organizations (UN and non-UN) contribute to the delivery of disaster management services across the different disaster stages (e.g., from prevention to reconstruction) and are also seen to encompass all aspects of disaster response (e.g., emergency communication, logistics, food, health, shelter, etc.). Despite a predominant focus on the role played by public organizations in disaster governance, the importance of stakeholder involvement is broadly acknowledged at the global level. Many types of organizations support international bodies in disaster relief efforts, namely regional platforms, multilateral coalitions, domain-specific mechanisms, and global action networks. A recent example of how such multi-stakeholders platforms can effectively respond to a regional disaster is represented by the 2014 Ebola crisis, in which the World Health Organization was effectively supported in its disaster response by the capabilities of ad-hoc, agile networks (Jensen et al. 2015).

### National

Based on the principle of national sovereignty, international law indicates that the organization of disaster relief on national territories is primarily a state's responsibility. However, a range of factors can impact a state's ability to fulfil its mandate. Firstly, the complexity of modern disasters invariably renders them *wicked*, transnational issues which require the concerted action of multi-stakeholders platforms. Secondly, in developing countries, central governments may not have the resources necessary to deal with the task demands of major catastrophes. This results in developing countries generally suffering from a higher death toll when affected by natural disasters, compared to more developed nations. Even the latter, however, are not exempted from problems in terms of response as the 2017 hurricanes hitting the United States so clearly illustrated. In extreme circumstances, they may be overcome by the magnitude of some disasters (see, for instance, the earthquake, tsunami, and nuclear accident that affected Japan in 2011) where the disasters exceed the capacity of the country to mitigate the impacts (usually as the result of a lack of early warnings). Thirdly, the highly debated topic of the "decline of the state" seems to provide an argument for the center of gravity of disaster governance being shifted away from the national level, to supranational entities such as the European Union. The principle of vertical subsidiarity indicates a preference for the delivery of public services to the closest level to the citizens and in this regard disaster governance is no exception. There is an argument that says that affected populations are better served by rapidly deployable, locally based resources, where those that provide the relief are aware of local conditions and cultures, and where

the chain of accountability is clearly defined. On a similar note, horizontal subsidiarity implies the involvement of new actors in the delivery of services traditionally provided by the government, a trend that has been largely acknowledged in the disaster response environment (e.g., private organizations and NGOs).

### Local

At the local level, sub-national entities ranging from local governments to private businesses, NGOs, and individuals also contribute in disaster relief. As noted by Aldrich and Meyer (2015), neighbors and family members usually provide first assistance in case of disasters, by leveraging the benefits of social capital networks established on the basis of proximity and kinship. These actors can prove particularly effective in short-term disaster response, but have undeniable limits when it comes to provide long-term disaster risk reduction, largely due to the limited resources at their disposal. This has contributed in shaping the modern concept of civil society which has been considered as a substitute for the more central provision of governmental disaster response, especially where the latter was reputed to be insufficient. The 2010 earthquake that affected Haiti provided an example in which international and local NGOs were capable of overcoming the governmental paralysis by mobilizing extensive resources. This receding role and centrality of public authorities includes different areas of life, not only disaster governance, and also involves other actors beyond NGOs. Private, for-profit organizations have recently managed to leverage the flexibility of their business models and a range of digital technologies to enter the "humanitarian aid market" by proposing quick disaster response (e.g., by using unmanned aerial vehicles or "drones" to assist victims of calamities), improved knowledge management systems (e.g., crowdsourcing to support disaster relief efforts), and more customized disaster relief services (for instance, in the form of comprehensive insurance packages). At the lowest local level, individuals' contribution to disaster relief has been profoundly changing, to the point in which single citizens often have a well-defined role in disaster governance. This is the case of disaster volunteering, a phenomenon that is experiencing two interesting dynamics (McLennan et al. 2016): a shift from a traditional, life-long commitment to a short-term, individualistic and episodic type of volunteering; and the emergence of *digital disaster volunteering*, in which volunteers offer their data and data-analysis capacity to create meaningful information through local reporting on disasters. These dynamics, combined with the support for disaster volunteering initiatives that some governments are demonstrating (e.g., Australia and New Zealand), reveal the increasingly relevant role that individuals are playing in the disaster governance scenario.

## Analysis and Conclusions: Where to Next?

Interestingly, state-driven disaster response has recently received renewed momentum from a global level initiative, *Disaster Risk Reduction* (DRR), an approach intended to minimize vulnerabilities and risks associated with disasters. In recent years, DRR has enjoyed significant traction, with two initiatives under the aegis of UNISDR: the Hyogo Framework for Action (HFA) 2005–2015, a 10-year plan to improve global response to natural hazards; and its successor, the Sendai Framework for Disaster Risk Reduction 2015–2030, which is a 15-year, voluntary, nonbinding agreement. The Sendai Framework in particular recognizes that the objective of reducing the impact of calamitous events should primarily sit with the state. Nonetheless, the framework acknowledges that such responsibility should also be shared with an enlarged range of stakeholders, including the private, local government, and not-for-profit sectors, among others.

The resulting picture for the future of disaster management indicates a scenario in which flexible governance arrangements will need to be the norm, rather than the exception. The focus of governance is not expected to be on the administrative tier at which disaster response efforts are spent, but on the platforms that are able to build capacity to manage disasters (Jensen et al. 2015),

regardless of their institutional location (e.g., public, private, NGO). Considering the current environment, this last element entails an undeniable need for more agile and adaptive forms of disaster governance, as also acknowledged by the World Economic Forum (2017). Nonetheless, amidst the fluidity of the disaster governance milieu, and in the presence of progressively more stringent requirements of accountability and transparency, the optimal mechanisms for allocating authority and responsibility of disaster management have to be further investigated. As a governance principle, subsidiarity can provide a useful lens to explore such mechanisms, as recent research has shown (Melo Zurita et al. 2015).

At the global level, a necessity to design and embed disaster management in sustainable development practices is an acknowledged priority. Some of these practices have been considered capable of directly producing effective risk management as in the case of reduced usage of fossil fuels that has the potential to diminish the impact of climate change. In order for this to happen, however, a twofold shift is necessary (UNISDR 2015). First, the focus should be on managing risks, rather than on managing disasters as a negative externality deriving from poorly managed risks. Second, further efforts should be placed on managing *intrinsic* risks (for example, those deriving from socioeconomic activities intended to enhance development), rather than *external* hazards. This change in perspective entails a longer-term perception of disaster management and a *proactive*, rather than the current *reactive*, approach to disasters (Tierney 2012). Finally, digital technologies have proven to be a powerful element in the support of disaster management organizations, allowing them to shift their efforts and investments from pure disaster response and recovery to prevention and preparedness. Digital technologies will, however, also bring with them emergent governance issues around the control and protection of information and its dissemination. What is clear is that the governance arrangements for disaster management will need to keep evolving to keep pace with the challenges and solutions to catastrophic events.

# Governance of Global Public Policies and Science Diplomacy

Francesco Amoretti[1] and Domenico Fracchiolla[2]
[1]Department of Political, Social and Communication Sciences, University of Salerno, Fisciano, Italy
[2]University of Salerno, Fisciano, Italy

## Synonyms

Cyber diplomacy; Science and technology

## Definition

Science diplomacy can be applied to the role of science, technology, and innovation in three dimensions: *science in diplomacy, diplomacy for science*, and *science for diplomacy*. The first relates to the function of informing foreign policy objectives with scientific advice, the second concerns the role of facilitating international science cooperation, the third refers to the use of science cooperation to improve international relations between countries (The Royal Society 2010).

## Introduction

The relationship between science and diplomacy is determined by a long-term history of intersection and positive externalities. It is also an old discussion with much rhetoric. As the US House Committee on International Relations stated in 1977 "Science and technology have had a significant impact on the foreign policy-making, specifically with regards to the methodology and the management of information adopted by the diplomatic apparatus." Moreover, science and technology have been shaping the intellectual training of diplomats, mirroring the prospective evolution of foreign policy objectives in the international political system. Over the years, the relationship between science and diplomacy has become more important to the conduct of foreign policy, increasing the need for proper strategies (Cooper et al. 2008). Mirroring the underway *Renaissance* on how science can be used to inform statecraft more effectively, the latest analyses emphasize the need to develop a *global science diplomacy agenda* and to strengthen the "*Multilateralism 2.0* where states allow other actors more and more involvement in global policy-making." In other words, the scientific community as well as the multilateral system should trigger the development of a new form of science diplomacy.

Global challenges require therefore a governance structure that "moves away from the traditional Westphalian model" where sovereign states block effective actions, and a more effective mobilization of S&T community to support such a *Multilateralism 2.0* that is in the making (Van Langenhove 2017). The actions of many actors exemplify the relevance of this process: several governments – acting as individual players and/or

G

as collective players at the intergovernmental level when promoting international conferences – as well as some international organizations, like the United Nations Educational, Scientific and Cultural Organization (UNESCO), the Organisation for Economic Co-operation and Development's Science and Technology Ministerial conferences, and nongovernmental agencies, like the American Association for the Advancement of Science and World Science Forum. With the transnationalization of policies and the rise of transnational policy networks, it can be assumed that the growing relevance of SD in international relations can foster coalition building and conflict resolution for sensitive global issues, some of which – such as environmental change, nuclear proliferation, human health, sustainable and inclusive development – are consolidated on the political and diplomatic agenda, while others – such as international terrorism, (*cyber*)security, and Internet Governance – are increasingly raising new challenges to all actors involved in the international arena.

## State of Art

Despite a long historical association between science and international cooperation, science diplomacy *as a concept* is rather new and reflects the fusion of two previously distinct elements: *science* as an evidence-based form of knowledge acquisition and *diplomacy* as a nonviolent approach to the management of international relations (Turekian and Kishi 2017). More precisely, it dates back to the 2010, thanks to the contribution of the *Royal Society* and the *American Association for the Advancement of Science* who identify three main types of activities or analytical dimensions: *science in diplomacy, diplomacy for science*, and *science for diplomacy*. The first relates to the function of informing foreign policy objectives with scientific advice, the second concerns the role of facilitating international science cooperation, the third refers to the use of science cooperation to improve international relations between countries (The Royal Society 2010). This perspective is shared by others scholars and oriented the debate at academic and institutional level. The overall idea is that countries are seeking to achieve some or all of the three Es of science diplomacy: *expressing national power or influence, equipping decision makers with information to support policy, and enhancing bilateral and multilateral relations* (Turekian 2012). More recently, analyzing the relationship between science and diplomacy, Paul Dufour (2016) highlights five traditional rules of engagement: the so-called "invisible college," the informal international community of scientists that form a *highly networked global enterprise*; the contribution of mutual understanding through science as an organized activity in discussions held in relevant international organizations like NATO, WHO, UNESCO; as a strategy for building political bridges when it is difficult to do so through the usual channels (there are several examples during the Cold War, like the talks between China and the USA with the so-called ping-pong diplomacy and the creation of the International Institute for Applied Systems Analysis); as an input to solve global problems like climate change; and as a way to link national pride with the growing international economic prowess, like BRICS countries made to increase their global standing.

Multistakeholderism has become more and more a third dimension of diplomacy, in addition to bilateralism and multilateralism, and the diplomacy field has broadened its boundaries. Indeed, considering more closely the actors it can be deemed as the many issues of science diplomacy are central to the agenda of multilateral fora like G7 and G20 and the forum for Asia-Pacific Economic Cooperation (APEC) (Turekian and Kishi 2017) or at bilateral level. For example, the USA and Japan collaborate in biomedical research since the 1960s, and they both support cooperation with countries of the former Soviet Union at the International Science and Technology Center. The Foreign Ministry Science and Technology Adviser Network held in September 2016 is a recent example (Turekian and Kishi 2017). Many states have scientific attaches in their embassies or have science diplomacy programs. The more structured cases are the USA and the UK who created the American Academy for the Advancement of Science (AAAS) with the

subsequent Center for Science Diplomacy and the US "Science Envoy Program" with Obama administration, and the establishment of the Royal Society in the UK.

New players have emerged attempting to make the link between science and diplomacy more immediate. Particularly, nongovernmental organizations (NGOs) have played an essential role in international negotiations, building linkages across countries (Betsill and Corell 2007). This can be defined as a whole – society approach extending beyond traditional interagency coordination and engaging with other actors of society that are extending their traditional reach. Although the conditions under which NGOs make a difference have not been elucidated, NGO diplomacy has made relevant contributions to the democratization of the intergovernmental decision-making process. By achieving incredible results as opposed to those obtained by state actors, they have proven to be rather efficient in the conduct of science diplomacy (Turekian and Neureiter 2012).

In recent years, discussion on global diplomacy is exploring the possibilities that technology bring to revolutionize diplomacy and mobilize governments and nongovernmental actors to solve global challenges by employing new communication technologies to diplomacy. According to Hocking and Melissen (2015), "*newness* in diplomacy today has everything to do with the application of new communication technologies to diplomacy" (9). The multiple challenges of globalization are sustained, in other words, by the processes of digitalization that are reshaping international relations and global power relations, modifying the meanings, the practices, and the tools of diplomatic activities (Kurbalja 2016).

## Main Issues

Science diplomacy is an instrument of global policy. On the one hand, there is the "traditional area of action" of science diplomacy, a set of policies that have been managed over the years. On the other hand, there are "new policies" declined within science diplomacy in the recent years, related basically to the diffusion of digitalization, like digital diplomacy. Moreover, science diplomacy fosters soft power and country branding, serving as a communication channel when diplomatic relations are difficult, though this effect is more evident in the "new" trends of science diplomacy, such as cyber.

The growing awareness of global problems is one of the most salient developments of science diplomacy, considering that global items like climate change, pandemics, natural disasters, nuclear proliferation as well as food security, water treatment and purification, health and hygiene, energy poverty, and shortages are connected to scientific and technological issues. In order to exemplify the importance of the science diplomacy in the "traditional" area of intervention, three cases will be presented: the climate change, the sustainable development, and the nuclear proliferation.

The proposed cases fit the three dimensions of science diplomacy relating to the scientific advising of foreign policy objectives, the function of facilitating international science cooperation, and the contribution to improving international relations at bilateral as well as multilateral level (cfr. The Royal Society 2010). In this way, both the insight of "traditional" science diplomacy in expressing the national power of states (cfr. Turekian 2012) and the five rules of engagements proposed by Dufour (2016) are empirically confirmed.

Since the 1960s, the climate change and the environmental degradation have informed the "traditional" policies of science diplomacy. Thanks to the work of some OOII, such as the World Meteorological Organization (WMO) and the International Council of Scientific Unions (ICSU), the problem of the increase of greenhouse gas in the atmosphere has been monitored, forming by 1985 a general consensus about the rise in the global average of temperature between 2000 and 2050 (Van Langenhove 2016). The UN multilateral system obtained encouraging results with the help of science diplomacy with the ratification of the Montreal Protocol on the phasing out of chlorofluorocarbons (CFCs), responsible for the "ozone hole" in the upper atmosphere. At

the same time, in 1988, the establishment of the Intergovernmental Panel on Climate Change (IPCC) represents another good example of the effectiveness of science diplomacy's approach on climate change, involving states, traditional OOII, and science community. The IPCC is a UN body responsible to prepare – based on available scientific information – a report on all aspects of climate change. The contribution of science diplomacy is helping the reforming process on climate change encouraging energy liberalization, the development of renewables, a better regulation, and technological transfers, alongside climate change mitigation and adaptation. The Global Strategy of the EU (2016), for example, clearly states that the EU will take the lead on the ongoing changes, increasing climate financing, driving climate mainstreaming in multilateral fora, raising the ambition for review foreseen in the Paris agreement, and working for clean energy cost reductions (Van Langenhove 2016).

Another traditional issue of science diplomacy is the sustainable development (Saner 2015). The role of SD in supporting innovation and economic development has been included as essential in the agenda of almost every country of the international community, at different stages of development. Beside developed countries like Germany, Japan, USA, UK, Australia, Canada, also the new economic giants of twenty-first century like China, India, Brazil, South Korea, and Singapore are looking for the right policies and investments to foster innovation and competitiveness using SD. At the same time, also countries like Chile, South Africa, Indonesia, Czech Republic, Malaysia, and Vietnam are on this path, exploiting the positive externalities of science diplomacy for sustainable development (UNESCO 2015). Indeed, science diplomacy is considered as a mean to reduce the many imbalances. For the three dimensions of sustainable development such as social, economic, and environmental sustainability, science diplomacy could greatly support countries' efforts in achieving their goals. While in industrial and middle-income countries science diplomacy can improve economic competitiveness in the international arena, in lower income countries it can be supportive of economic and social progress for promoting local production and home-grown services that incorporate modern technologies. The expression "science leapfrogging diplomacy" exemplifies a fundamental contribution that science diplomacy can give to sustainable development, suggesting innovative solutions that bypass political stalemate or contrast (Kjellen 2014). In this realm, the Global Sustainable Development Reports (GSDRs) produced within the 2030 Agenda promoted by the UN are a great opportunity for strengthening science diplomacy in economic development. A second opportunity for involvement by the scientific community is the Technology Facilitation Mechanism (TFM), created by the 2030 Agenda, representing science and civil society appointed by the UN secretary general to work with the UN agencies and multilateral institutions on the role of science diplomacy for sustainable development.

The nuclear security is a third example of how science diplomacy has traditionally shown its effectiveness and its long-standing success, giving a fundamental support to the international community in establishing confidence in the Threshold Test Ban Treaty control system, fostering the non-proliferation efforts, and blocking violent responses to provocative threats posed by some actors. The success in science diplomacy between the United States and the Soviet Union on the limitation and then reduction of nuclear weapons is one of the best results of science diplomacy. On a general scale, examples of classical scientific cooperation are those between the USA and the Soviet Union, the establishment of the European Organization for Nuclear Research CERN, and recently the nuclear agreement between the USA and Iran that has revitalised aspects of US diplomacy as a bridge-building strategy (Moedas 2016).

Today, the contribution of science diplomacy in this area is of highest importance, considering that nuclear threats are still high. Because of the technical complexities of nuclear fuel cycle and its interest for terrorist, science diplomacy is very supportive in establishing a variety of policy measures and physical safeguards to prevent nuclear proliferation and nuclear terrorism. Moreover, verification of treaties, including nuclear arms reductions and test bans, and cooperation on

ballistic missile defense (BMD) are valuable topics in which science diplomacy has an essential role to play, building confidence and identifying technical options for cooperation. This aspect is verified also when science diplomacy is applied to bridging the societal domain (governance, economy, and values) and the natural domain (ecosystem, water quality, and water quantity).

Beside the multiple and diversified area of policies of "traditional" science diplomacy, in the last years the digital revolution has brought to a reconsideration and a rethinking of the most assumptions regarding the interaction between diplomacy and the soft power. The main transformations under way reflect the re-imaging of diplomacy in light of the digital communication revolution. *Digital diplomacy* is a good example of the "new wave" under way. Being defined as the use of social media for diplomatic purpose, digital diplomacy established a central role within science diplomacy in a few years, reshaping the meaning and tools of public diplomacy. Policy innovation and institutional adaptation are its main features affecting both the core functions of diplomacy (representation, communication, and relationship management) and the capacity of bureaucratic and political apparatus of government to adapt to the social media age. Indeed, the innovative features of digital diplomacy can be envisaged considering the scope of its activities and the depth of the reforming influence exerted in different features of the foreign policy of the countries deeply involved in the digital revolution. It contributes to influencing a country's international agenda setting, and it is used as a tool for shaping and representing the images of countries with official social media accounts. According some scholars, these new tools, like social media platform for diplomats or innovative two-way communication process, allow some level of participation for ordinary citizens, letting diplomacy out of its traditional ivory tour of secrecy (Bjola and Holmes 2015).

## Future Trends

In the emerging international scenario, both "traditional" and "new" global issues will be reformulated, and the need of a *global science diplomacy agenda* and the strengthening of the *Multilateralism 2.0* can be deemed as the major future trends consolidating the increasing relevance and the evolution of science diplomacy. According to Langenhove (2016), the global science diplomacy can be divided in three different strands, considering the science in global diplomacy, the diplomacy for global science, and the global science for global diplomacy. The first area of intervention regards the working of scientists serving as science diplomats; the second one concerns the conceding of scientific advice included in the policy-making process at multilateral level as well as at state level, aimed at facilitating science diplomacy managing global problems; the third area imply advocacy networks and funding for the support structures in order to deliver S&T advice at a global level. On the other hand, multilateralism 2.0 grants more opportunities to actors different from states of giving the input in the process of dealing with current global problems. This evolution for the traditional multilateralism is characterized by the growing diversification of multilateral organization, the increasing relevance of nonstate actors, the horizontal interconnectivity between policy domains, a major involvement for civil society, and new modes for diplomacy, such as cultural diplomacy. Even if not yet well recognized by scholars of SD, the policy field where such developments are becoming increasingly essential is the *Internet Governance* that is not just a technical issue but about market economy, political power and influence, human rights, government institutions, and so on (Brousseau and Marzouki 2012). Indeed, the *disruptive* potential of digital technologies will become a hot topic in the next years, claiming a radical change of diplomatic activities, tools and strategies to facilitate coalitions building and conflict resolution for such sensitive and critical problems. Beside traditional global policies, the intersection between IG and science diplomacy can be therefore deemed as the last frontier of the long-term process of intersection between scientific knowledge and political decision-making at national and global level. The evolution of Internet Governance domain shows the rising relevance of *cyber security*

issue (DiploFoundation 2016). Historically integral part of government's national defense and foreign and security policies and doctrine, cyber security strategies have acquired an international salience, reorienting the overall political agenda both at bilateral and multilateral level (Christou 2016).

This development is not a temporary phenomenon, but it is a dimension of policy being consolidated thanks to intensified threats posed by cyber-aggression or cyber-conflict, mainly fueled by the certainty that, on one side, there is an increasing number of states using cyberspace to achieve strategic ends, and, on the other side, that also nonstate actors are exploiting cyber-tools potentialities for disruptive activities. Dealing with these complex processes requires new structures and forms of global governance and, consequently, new diplomacy's capacity is needed. In response to these threats, a number of multilateral organizations have indeed proven useful in developing or coordinating cyber security policies. The *Fifth UN Group of Governmental Experts (GGE)* and the launch of the *Global Commission on Stability in Cyberspace (GCSC*) at the Munich Security Conference (February 2017) exemplify these efforts to exchange best practices and expertise on *cyber capacity building to normalize* the cyberspace. This is only the beginning. Cyber security, as a *new complex domain of policies*, will trespass on other IG issues, changing the environment of diplomatic discourses and practices to achieve international agreements to *protect the Internet* from its enemies (Maurer and Ebert 2017).

## Conclusions

Global challenges require scientific evidence in order to understand and find sustainable solutions, as well as a new governance structure that "moves away from the traditional Westphalian model," and a more effective mobilization of S&T community to support the rise of such transnational policy networks. Diplomats have to be prepared to work in fast-changing geopolitical and geoeconomic spaces where science diplomacy is becoming increasingly relevant. Part of this development mirrors the changing nature of international negotiation and also the character of processes marked by its technical qualities and uncertainty. In the new environment, new knowledge and mutual understanding among actors involved are needed. The diffusion of digital technologies, with its *disruptive* capacity, is opening a new scenario, with the growing engagement between actors in multilateral diplomatic organizations but also at national level. The rise of Internet Governance issue and, in particular, of the cyber security as a critical problem that threat the survival of the contemporary market economy and social order will shape international relations and policy outcomes. This complex agenda will require inventive modes of global governance, where diplomacy will be not what it was and what it is.

## Introduction

At the era of knowledge societies and economies, no doubt that higher education has a great importance in the development of nations. Indeed, the development and transfer of knowledge and know-how which are useful for the state, communities, and firms is conducted through higher education. The advanced skills and knowledge necessary to build competitive, prosperous, and sustainable communities are prepared within the higher education institutions. As last link of the educational chain, the higher education institutions boost and reinforce the other levels of the national education systems (Dejean 2007).

Everywhere in the world, departments, teachers, as well as other structures of higher education understand that they must take complex challenges. On one hand, we notice an increasing complexity of the social-economic and political demands on the higher education services. These demands require great efforts to tailor the offers of education courses, pedagogic practices, and research methods. On the other hand, we notice a cumbersome tendencies characterized by the scarcity of specialized resources and transformational pressures of management executives and organizational structures (Jambart 2001). This dual finding is part of a world dynamic driven by the ideological, social-economic, and competitiveness challenges affecting the national and international institutional programs and which severally test the architecture of the traditional governance of higher education institutions (Brennan and Shah 2000). While Algeria keeps the national features and priorities in terms of studies contents and organization, it faces (or at least must face) the same problems of higher education governance.

In this context, a new education policy and a new procedure of drafting education courses offers have been adopted following the progressive implementation of the LMD system in 2004. The last education courses were integrated definitively in 2010 upon order from the Algerian Ministry of Higher Education and Scientific Research. The changes in laws and legislations occurring afterwards have made a radical change. The switch to the LMD system has greatly forced the financial (and human) resources dedicated to education to be fed henceforth to steering, readability, and quality. It is worth to mention that the Algerian higher education institutions are not all endowed with a pure establishment project. However, the strategic

goals of education (such as those relevant to governance and research) are determined by the policy of the Algerian Ministry of Higher Education and Scientific Research (*World Bank Group* 2012).

In order to make an evaluation about the degree of progress of the reform and establish the current situation of the Algerian university, we have conducted this study.

The Algerian context incited us from the start of our research to use the inductive approaches. The use of inductive approaches is justified by the poor level of researches about higher education governance in Algeria, in particular from the point of view of management sciences. The used inductive methods consisted of participant observation, semi-structured interview attempts with the managers of universities in Algeria, and documentary researches. This technique allows building a problematic and hence to overcome the difficulty of an inductive research which resides in the lack of a defined purpose of the research from the beginning. This does not prevent from considering a second approach for future researches, namely, the deductive method. It starts from suggestions made by the theory. This latter is based on a set of concepts, which constitute the basis of a model reproducing a coherent interpretation of the observed phenomena. The set of hypotheses is ultimately tested in practice to ascertain whether the proposed suggestions correspond to reality or not.

However, it is important to remind the sectoral objectives of the Higher Education and Scientific Research in Algeria. These objectives are set in the light of the Algerian-European Program of Support to the sectoral policy of Higher Education and Scientific Research in Algeria (The aim of this program consists of supporting and accompanying the Ministry of Higher Education and Scientific Research in Algeria in its modernization scheme of the sector with a period of execution extending to 72 months (5-year plan 2009–2014)) (PAPS-ESRS program) (Benziane and Benchikh 2014). This program was set around six sectoral objectives, namely:

- Reinforce and rapidly extend the access to higher education.
- Ensure an education of quality fulfilling the international standards.
- Enhance the research capabilities.
- Support a better integration of the higher education institutions in their social-economical environment by increasing the relevance of the proposed education courses.
- Promote and diversify the national and international exchanges and cooperation.
- Set the base for good governance based on the involvement and coordination of all actors in the university community.

The Algerian university entered a qualitative phase requiring from it to adopt measures, mechanisms, and practices in line with its environment, not only national but international as well. Consequently, new notions are becoming common in the speeches of all stakeholders of the academic community (teachers, students, and administrative staff). Words like quality, quality assurance, referential, benchmarking, standard, criterion, and evaluation are now used in the comprehensive management of universities. Moreover and in order not to miss the train of innovation, quality, and the continuous improvement of its processes, the Algerian university decided to address directly the challenges of the twenty-first century, namely, visibility, excellence, and transparence. This synthetic study of the governance modes of some Algerian universities try, in a limited way but certainly sufficiently objective, to address maybe in a non-exhaustive but systematic manner, the strengths and weaknesses of the Algerian university in the sectors under its management, namely, education of students, development and research, and improvement of governance (Ghalamallah 2014).

## The Institutional Context

### University and the Context

Article 53 from the Constitution of 1996 stipulates that the state must organize the education system, and it makes it clear that for all Algerians:

- The right of education is ensured.
- Education is free of charge within the conditions defined by law.
- A compulsory basic education.

The higher education system is subject to the authority of a minister of the government, who draws up and implements the policy of the government about higher education and scientific research.

## Higher Education Institutions

There are two types of higher education institutions:

- Public institutions of scientific, cultural, and vocational nature, under the tutelage of the Ministry of Higher Education and Scientific Research:
- Universities.
- University centers.
- Ecole Normale Superieure (Higher education college).
- Ecole Nationale Superieure (Higher national education college).
- Public institutions belonging to other ministries however their pedagogic tutelage is ensured by the of Higher Education and Scientific Research:
- National institutes of higher education.
- Colleges of engineers.

Universities are organized in the form of faculties, and these latter are themselves subdivided into departments and even sections. They may include also one or more institutes. The university centers are decentralized components of a university. The national colleges (ecole nationale) and the national institutes are dedicated for the education of engineers in a given sector of activity. The role of the higher education colleges (ecoles normales superieures) consists of educating teachers of primary, intermediate, and secondary schools. It is worth to mention the existence of a university of continuing education (UFC), created by the decree dated 1990, allowing students non-holder of secondary school certificates to access to higher education thanks to 50 centers of continuing education spread over the entire national territory (Berkane 2014).

## University Governance

The Algerian universities are organized in the form of:

- Chancellor's office.
- Four vice-chancellor's offices:
- Vice-chancellor's office assigned for the graduate higher education, continuing education and degrees.
- Vice-chancellor's office assigned for the postgraduate higher education, academic qualification and scientific research.
- Vice-chancellor's office assigned for external relations, cooperation, and animation and communication, and scientific events.
- Vice-chancellor's office assigned for development, prospecting, and orientation.
- General secretariat assigned for administrative and financial management of the establishment.

The chancellor of the university is appointed by the responsible ministry. Universities are managed by a board of directors, chaired by the minister or his representative, and a scientific board chaired by the chancellor. The elected officials, representatives of all teaching staff, personnel, and students all participate in the management and organization of studies within the board of directors and scientific board of the university, boards of the faculties, institutes, and departments. It is worth to mention that persons from outside the university and social-economic sectors serve in the board of directors.

In order to execute his education policy, the minister relies also on some authorities, such as:

- CNU (National Conference of Universities), an authority in which serves all heads of higher education institutions. It is chaired by the minister of higher education.
- CRU (Regional Conferences of Universities), an authority in which serves the heads of institutions within each one of the three regions: CRU west, CRU center, CRU east.
- A board of academic ethics and deontology.

- CNH (National Commission of Qualification) and CRE (Regional Commissions of Evaluation), whose duties consist of validating the education courses offers emanating from universities and authorize these latter to issue corresponding degrees.
- CUN (National Universities Commission) assigned with the duty of qualifying teachers in the ranks of senior lecturers and professors of universities.
- CNEVAL (National Board of Evaluation of Higher Education Institutions).
- Commission of deans and chairmen of scientific boards.
- Commission of the officials in the field.

## Financing Universities and the Financial Support Given to Students

Universities are entirely financed by the state. Accordingly, they receive a budget allocation fixed by the state; however, they may also mobilize resources, from public or private origin. The expenses are subject to a financial control (a priori and a posteriori). The financial support given to the students is made in two ways: indirectly through a housing subsidy (+50% of students are accommodated in a university residence), catering, transport, and coverage of health expenses but also directly by granting scholarships (about 85% of students receive scholarships) (World Bank Group 2011).

## Admission, Organization, and Evaluation of Teachers (Professors)

Higher education can be accessed, as of right and free of charge, by students having completed the three full stages of primary, intermediate, and secondary education (in total: 12 years of education) and who have succeeded at the end in the examinations of the secondary school certificate. Any Algerian holder of a foreign certificate equivalent to the secondary school certificate is also entitled to be enrolled free of charge in a university institution. The number of students enrolled in the higher education institutions (all stages together) exceed the figure of 1,300,000, almost 60% are girls (MESRS).

The executive decree dated August 29th 2004 governing the organization and operation of universities and the law of orientation of higher education dated February 23rd 2008 have introduced a reform in that sector by implementing a new architecture and organization of the courses in all fields (except the medicine) based on a system composed of three levels: licentiate (bachelor)/ master/doctorate (commonly called LMD system).

Universities determine the education curricula of the specializations belonging to their competence. There is a common-core stage for all institutions for each domain at the national level. Since 2004, universities issue bachelor degrees (secondary school certificate +3 years) with 180 credits (first stage), master degrees (secondary school certificate +5 years) with 120 additional credits (second stage), and then the doctorate degree (third stage "postgraduate"). In this system, education became biannual and composed of saved and transferable education units.

This new context allowed more professionalism in some courses of bachelor and master degrees. Regarding the evaluation of LMD system, it is made each semester, where in each semester there is a final exam and many continuous tests including watched assignments, homework, practical work tests, reports, presentations, etc. At the end of each examination session and in case of failure, the student may be admitted to redo one or more examinations or a second session (MESRS).

## Appraisal

### Goals and Objectives of the University

The Algerian university strives, since its creation, to primarily face the challenge of increasing numbers of admitted students, and this permanent challenge reduced considerably the initiatives of the faculties and the quality of courses and services. As public institution of higher education, it

strives to fulfill efficiently its leading role as a venue of education. It is true that it attempts also, sometimes with limited means, to operate according to international rules in order to carry out appropriately its state teaching duties: democratization of education, development of a high-standard education system, institutionalization of research (giving all teachers the status of teacher-researcher), inserting its actions within a universalist approach, and training teachers as per state of art methods and technologies (Baddari and Herzallah 2012).

## Means

It is understood that it is not enough to set targeted goals and objectives. The means, even if huge, may sometimes hinder the teaching and management processes. The agenda of the university includes, from structural and organizational point of views, as well as within its developed activities and executed actions, elements which may facilitate the attainment of its goals and objectives, namely, an information system and a functional numerical system. If the organizational structure of the Algerian university does not greatly differ from other international universities, however, we should recognize that the central departments have sometimes established their own structures (doctoral house, pedagogy monitoring center, psychological-pedagogic counseling unit) as well as positions charged with ad-hoc duties non-stipulated by the regulation to carry out activities closely related to the ultimate objectives of the institution. The university has also created various entities through cooperation such as the Francophone Numeric Campus of the Francophone University Association (Commission Europeenne 2009).

From the management and governance point of view, and though the Ministry dictates a binding regulation whereas they are the realities in practice which are restrictive, the university reacted appropriately to the problems imposed on it. Regarding the implemented quality management system, it is noticed that the non-reactivity or the delay in fulfilling the tasks are slowing down the measures and actions taken at all levels.

A fundamental dimension of the university consists of the continuing training of its staff. By drawing inspiration from governance questions at the faculties, it is clear that a continuous training remains a priority for these faculties, and all of them say that they undertake the promotion and advancement of their staff. However, there is no systematic approach of the process. Continuous training is the fort of individuals who attend courses in order "to be trained." For teachers, a training course is the only means of training. Hence a kind of drawback may appear regarding the professionalization of the sector: there is a great lack of initial training of the clerks and teachers even though training courses are offered each year. It is true that internally, the professional advancement depends to a large degree on the concerned persons and not the central or faculty administration. The administrative clerks are greatly penalized in their internal promotion from individual training point of view. As a consequence, this affects negatively the quality of services. Nonetheless, teachers have more chance to be trained, if they desire to do so. The training courses abroad for teachers are conducted to the detriment of the scientific internships which are becoming less desirable. There is a chronic lack of policy for the training of trainers which affects negatively the quality of the process.

On the other hand, the services to the community still remain minor if not nonexisting (all structures say that they lack training schemes for the categories of the social-professional sector), beyond the education of the large numbers of students. It is true that the social-cultural, economic, and political environments remain insensitive to the universities/academic skills. A kind of distrust persists within the society or the firms towards the university. As for the transfer of knowledge, we can think that it is working properly (though the central departments and faculties recognize unanimously that they lack strategies for the training of pedagogy to teachers); the refresher courses, postgraduates' courses, and the availability of research laboratories compensate somewhat what this lacks (all teachers are

considered teachers-researchers, but in fact only 60% conduct researches). However it is worth to mention that some teachers do not make lot of change in the contents of their course over the years. One of the evident objectives of the internal policy of the university consists of the internationalization of its practices (postgraduates' training courses, multiform relations with foreign institutions, co-supervision, co-graduation, foreign lecturer. . .). The increase of interuniversity conventions and agreements with foreign institutions helped in raising the standards (Bakouche 2014).

## Conclusion

Due to the requirements of the knowledge society and the knowledge economy, huge transformations efforts, whether initiated or imposed, are being deployed globally by public and private universities and colleges. At the center of the mutations engendered by such institutional transformations, we have the notion of "results." This requires continuous efforts of adaptation, in particular regarding the official organization of management and the structures rendering training and research services.

In Algeria, a significant university reform was started in 2004. The goals and objectives of many relevant projects consist of overcoming the complex challenges imposed by the modernization of the management and organizational structures of higher education sector. From management side and in return of more independence demanded by the officials of the higher education institutions in Algeria, the Algerian public authorities call for justifying the results and outcomes obtained by the institution. In this institutional context, we have conducted studies about the state of governance of some Algerian universities. The results of the studies underline the importance to continue the reform of governance of the Algerian universities, by relying on their strengths and improving their weaknesses. Furthermore, it is more than necessary to initiate significant investments in order to provide the higher education institutions in Algeria with information systems and skills needed by the new frame of management required by their modernization, based on a continuous improvement of the results, measured and evaluated objectively, and also based on the development and modernization of the sector of higher education and scientific research in Algeria. In the era of competitiveness between states and nations, it is a vital issue to develop the higher education section and as a consequence the entire society and economy.

### Synonyms

Academic governance; Higher education systems

### Definition

Academic governance, as a new topic from recent years, refers to a complete set of relations which drives policy-making systems in academic settings. The emergence of this concept in the field of higher education has led to the development of different models of academic governance. Therefore, evaluating the efficacy of different models of academic governance is of great importance.

### Introduction

Studies have shown that university governance is an important and significant matter. Indeed, public interests grow more through university governance than through corporate governance in the business world. It is not only a question of ensuring the honesty and transparency of the processes, but also a question of allowing society to invest more heavily in education, knowledge, and intellectual innovation (Prondzynski 2012). The constant growing of the number of public and private institutions makes higher education systems more complicated. This entails the task of management and monitoring the sectors to become more specialized. Consequently, old models of the full control from the central ministries of education have proved unsustainable in the long run and are being replaced by other new models (2008). Academic governance, a new topic of interest from recent years, emphasizes a complete set of relations which drives policy-making systems in academic settings. The emergence of this concept has led to construction of different governance models which have affected the survival of higher education in different periods of time. Regarding this, some scholars have predicted a long-standing presence for the concept in the field of higher education (Shattock 2008).

Higher education literature includes different models of academic governance which have been used in higher education settings for many years. However, the insufficiency of some of these models has led to the emergence of new models. From among these models, university governance by the academic staff, corporate governance, trustee governance, and stakeholder governance (Shattock 2008), and also amalgam models of governance (Birnbaum 2004) have been especially paid attention to by different scholars. The present study is first to examine a number of governance models in higher education. The study is, then, to investigate the relationship between the existing governance methods and the optimal methods of governance in higher education. In line with these, five models of university governance, namely university governance by the academic staff, corporate governance, trustee governance, stakeholder governance, and amalgam models of governance have been introduced. The study also discusses the practicality of each of these models, which is considered as a challenging issue in higher education. The results of analyses done in Iranian higher education society have indicated that there are several different purposes beyond the application of each governance

model in different situations. Indeed, universities and higher education institutions of the third millennium undertake different missions, and thus one model is not efficient in and does not fit all academic settings. But the multiplicity of missions of universities in the country impels higher education planning to benefit from other models in the governance and management of universities. This study introduces and clarifies a number of governance models and examines their efficiency in relation to higher education in order to improve management methods and practices in managing centers of knowledge production. In line with its objectives, the present study is an attempt to answer the following questions:

1. What are the major international academic governance models?
2. How can academic governance models be utilized in practice? In other words, can the experiences obtained through the implementation of global models in universities and higher education institutions be used for designing an amalgam model of the governance?
3. What are the main consequences of trustee governance to Iran's higher education system?

## The Concept of Academic Governance

Although there seem to be large differences between definitions given for governance, a careful look at these definitions reveals that a single concept of governance has been emphasized in all of them (Harman and Treadgold 2007). Consider governance in educational settings as a conceptual framework through which higher education systems and institutions are organized and managed. Some scholars believe that defining governance is both simple and complex. Indeed, governance is an answer to the question: "Who makes university-related decisions?" (Goedegebuure and Hayden 2007, p. 2).

Shattock (2002) believes that academic governance is related to the responsibility for determining university strategy. In his recent book, *Managing Good Governance in Higher Education*, the researcher refers to the point that although governance is defined differently in different fields, governance in relation to universities and higher education institutions refers to the forms and processes through which universities can manage their academic activities. The researcher further believes that although the two terms "governance" and "management" are theoretically different, there is a close relationship between them in academic settings. If we believe that teaching and research are the primary responsibilities of university, therefore, improving faculty members' motivation and facilitating coordination among them are considered as a governance tool which can help in fulfilling these responsibilities. Accordingly, governance as part of the organizational regulations of all institutions, including university, can be defined as follows:

– The way public or private universities are naturally structured and organized
– The way universities develop policies and strategies and benefit from them in working out their operational plans
– The way universities are legally adapted to their setting and operating systems
– The way university interacts with external sectors (Wicker, as cited in Shattock 2008)

It is worth mentioning here that governance in public universities is significantly affected by government policies which have a special emphasis on efficient governance. Some experimental evidence in 1990s emphasized management effectiveness and governance settings at universities. In this regard, three guiding principles, namely institutional autonomy, academic freedom, and openness, have been paid attention to. Consequently,

- Institutional autonomy of universities should be respected.
- Academic freedom should be supported within the law.
- Academic governance plans and arrangements should be open and responsive (Trakman 2008).

Based on an operational definition of the aim of the academic governing body, a leading

organization is totally responsible for monitoring institution activities, determining its future course, and provision of an environment in which the institutional mission is to exploit learners' full potential. According to Prondzynski (2012), university's management responsibilities include:

- Careful monitoring of university in order to provide sustainable security in short- and long-run
- Undertaking university's mission and offering improved services to the public
- Securing optimal use of funds
- Ensuring the participation of the *broader community* in the organizational performance

It is noteworthy that these governance principles can be applied in academic strategic planning, efficient monitoring, financing and auditing, and other academic tasks. Now that the concept of governance has been clearly defined, we overview a number of international academic governance models. It should be mentioned, however, that from among the academic governance models, trustee governance has been being used in the field of higher education for several decades. Therefore, the present study tries to describe it in more detail and shed some light on some of the organizational and meta-organizational challenges faced by it.

## Models of Academic Governance

As it was mentioned before, with the emergence of research interest in the field of academic governance, researchers and higher education administrators showed an interest in the methods and models of academic governance. The complexities of higher education systems lead to the complexity of governance processes and methods in these systems. Therefore, a focus on the theoretical foundations of these models seems necessary for their clear identification and leads to a better understanding of their nature and functions. Considering these, five models of academic governance along with their characteristics are described in the following parts.

### University Governance by the Academic Staff

University governance by the academic staff, which is sometimes referred to as the Oxbridge Governance Model, points to the most obvious form of self-governance (Shattock 2008). Based on this model, which is the oldest model of academic governance, universities should be basically managed by their faculty members. The model is also sometimes referred to as collegial governance. Philosophically, *governance* of *faculty members* is a manifestation of academic democracy in academic settings (Trakman 2008).

### Corporate Governance

To achieve accomplishment, corporate governance requires all participants, including board of trustees, managers, faculty members, staff, and students, to make firm commitments and concentrated efforts over time. The model has been commonly applied in many academic settings, such as Australian universities and higher education institutions (Harman and Treadgold 2007). The main criticism against corporate governance model is that its use might lead to a co-modification approach and irregular commercialization in higher education. To sum up, the selection of the corporate governance model by a university depends on the university's background and context.

### Trustee Governance

The first boards of trustees were created in European universities and also in the prestigious US universities in the fourteenth and seventeenth century, respectively. Nowadays, boards of trustees are the governing bodies of many European and American Universities (Davari 2010). Boards of trustees, as the heads of the Universities' *and higher education institutions' academic structure*, have many heavy responsibilities. Preserving university independence and safeguarding its authority, supporting academic freedom of scientific faculty members, and guaranteeing effectiveness and efficiency of both their policies and practices are from among the most important duties and functions of a board of trustees who is a *governing* body of *university or higher education institution and who plays an*

*important role in directing academic institutions towards more efficient systems* (Duryea 2000; Campbell 2002). Some researchers have mentioned that clarifying university's mission; assuring academic planning; setting academic goals; evaluating academic performance; *approving academic programs*; ensuring the well-being of faculty members, staff, and students; *providing financial resources*; and preserving academic independence are from among the major responsibilities of a university's board of trustees who plays an important role in the survival of the university (Ingram and Weary 2000). In the trustee governance model, success of governance is achieved through developing trust between members of a board of trustees. Therefore, building trust between members is considered to be very important for the use of this model. The pros of trustee governance believe that following of this model can help in providing assurance about the high quality of governance. However, some scholars believe that trustee governance model is vague because few instances have been reported with respect to learning this model in public higher education centers (Trakman 2008).

### Stakeholder Governance

The stakeholder governance model is different from collegial, corporate, and amalgam models of governance. When governance affects a wide range of stakeholders such as students, faculty members, graduates, government, and the society as a whole, this model is used in universities and higher education centers. Stakeholder governance is the manifestation of a wide range of environmental, value-related, and other general interests. The cons of this model, however, ask questions about whose interest is served more than the others in university decision making (Trakman 2008).

### Amalgam Models of Governance

Robert Birnbaum (1991) was the first person who proposed the idea of amalgam models of governance as a combination of academic governance models of university governance by the academic staff, corporate governance, trustee, and stakeholder governance models. In one of his articles, he points to the end of corporate governance (Birnbaum 2004). Some researchers believe that amalgam models of governance are related to multilevel governance in academic settings (Meier et al. 2004). Accordingly, the governance objectives of amalgam models include:

1. The creation of a knowledge-based society
2. Efficient allocations of financial resources, to achieve specific objectives, by the government
3. Economic development, which can occur though fostering innovations
4. Protection of academic freedom of university faculty members
5. Critical mass creation in the academic disciplines or in other professional domains, which the university tries to conquer
6. Creation of an academic environment, which allows students to achieve what they deserve

Therefore, the amalgam models of governance entail experiencing innovation in academic governance and moving away from a focus on the number of students enrolled to a focus on environmental reponses. These models try to benefit from the strengths of other governance models to meet academic needs (Trakman 2008).

## Consequences of Trustee Governance to Iran's Higher Education System

Several studies have been conducted on the consequences of trustee governance to Iran's higher education system (Davari 2010; Azargashb et al. 2007; Kaskeh and Mohebzadegan 2011). The results of their study showed that the trustees' decisions were mostly on areas related to the academic staff affairs and financial and transactional ones, and just 14% of the approvals were related to the academic policy making. It is a problem whose enforcement is related to the authorization of policy making to the trustees within the framework of the ministry's macro policies. The researchers believe that one of the issues to which the trustees should pay much more attention is policy making

to increase revenue while approving administrative, financial, and transactional affairs, because this issue is considered the infrastructure of more financial independence and less dependence on state resources. Another point emphasized in this study is related to the trustees' nonuse of the legal capacity of article 49 of the country's Fourth Developmental Plan (Azargashb et al. 2007). One of the most comprehensive projects conducted by Kaskeh and Mohebzadegan (2011) to analyze the performance of the trustees in the country is "the evaluation of the performance of the trustees of the ministry of Science, Research and Technology." This project evaluated the performance of the trustees through considering the functions and the composition of the trustees. The results showed that:

Upstream laws and regulations effectively limit or increase the power of the trustees. Mentally, they create a climate which helps this institution to be more conservative or creative. Moreover, the research findings showed that the trustees can perform better through sufficient authority, and higher education experts explained the legal capacity of article 49 of the Fourth Developmental Plan and the implementation challenges it faces with. From the researcher's point of view, among the main challenges facing trustees are lack of acculturation of academic senior managers for full deployment and maintenance of legal order, institutionalization, and improvement of the middle managers and academic staffs' knowledge concerning the details of the trustees' legal authority. According to the abovementioned points and the main challenges facing the trustees' performance in the last decades, a noteworthy issue is that in the light of the use of trustee governance model in the governance of universities and higher education institutions in the past decades and the practical experiences gained through using this model, isn't it necessary to use other governance models, such as academic governance, university governance by the academic staff, corporate governance, stakeholder governance, and amalgam models of governance, in higher education system in the years ahead, and particularly in the sixth Developmental Plan?

## Conclusion

In an era when environmental changes are happening at a very high speed, universities and academic environment management have become vital elements; using the governance models in the efficiency of education and research in the scientific environments has played a significant role. On one hand, experts believe that higher education is a system that is challenged. In the previous decades, universities and higher education institutions enjoyed a prestigious status. Therefore, they were known as *knowledge pioneers* in production and distribution of knowledge (Rowley 1997). However, this central role is changing; on the other hand, some pointed to the credulity of pretending that the increasing pressures on universities implemented by government, employers, and university students in recent decades will decrease. Even academics are faced with greater pressure to be accountable for educational competition through the challenges of new learning methods, new teaching technologies, and new requirements. Above all, uncertainty about the proper role of tasks and the performance of various universities in higher education system is prevalent. Some experts pointed out that educational institutions are *loosely coupled* (Bush 2003, p. 103). If the abovementioned issues are true in higher education system, there is an inevitable need to reconsider the organizational structures and procedures of the institution. Moreover, universities must seek to recreate their governance structures. Extensive studies have been conducted on academic governance and its various models in universities and higher education institutions around the world. However, few studies have been conducted on the use of these models in the country's universities, and as mentioned above, the academic governance approach has focused on the analysis of the trustees' performance in Iran in recent years, and little attention has been paid to other academic governance models in the country's higher education system. This gap in the literature indicates the necessity of using new models and frameworks in higher education

institutions with the richness of literature, especially in the third millennium. Therefore, based on the findings of the study, some recommendations are presented to the authorities of higher education system, including government, the ministry of Science, Research and Technology, and senior managers of universities and higher education institutions so that they can adopt basic strategies in university development planning and policy making, as follows:

1. Understanding the features and complexities of higher education system, recognizing the independence of universities and academic freedom are urgent requirements to implement the effective governance in universities and higher education institutions.
2. To develop a strategic understanding of governance models in the international and valid universities, university administrators should imitate and improve the implementation of other governance models through the development of new public management perspectives.

# Governance of Intellectual Property

Laurent Manderieux and Gabriele Gagliani
School of Law, Bocconi University, Milan, Italy

## Synonyms

Creativity; Economic governance; International regulation; International trade; Inventions; Policies

## Definition

The international regulation of rights and obligations relating to intellectual property (IP) protection; the international regulation of the protection of inventions and creations of the mind; the complex body of international agreements and conventions, international

jurisprudence and case law and States and international organizations' actions, and initiatives concerning intellectual property.

## Introduction: Intellectual Property Rights

Efforts to establish a set of rules addressing intellectual property at the international level represent early historical attempts to regulate international economic relations. And yet, internationally, intellectual property remains still highly fragmented both theoretically and in practice. From the theoretical point of view, one might safely say that overall, intellectual property rights protect creativity, by affording creators the possibility to exclusively control (i.e., the exclusive commercial exploitation of) their creations. Creators are thus afforded incentives to create and innovate, while, in exchange of the exclusive control they are granted, society generally benefits from the diffusion of innovation and intellectual creations.

This *do ut des*-like relationship is declined in and through a number of intellectual property rights that have different purposes and disciplines. Intellectual property rights are commonly divided into the two groups of industrial property (including patents, distinctive signs, and industrial designs) and copyright and related rights. However, already at the theoretical level, the dividing line between these two categories and the contours of each intellectual property right might vary significantly from country to country. For instance, the Spanish concept of "propiedad intelectual" does not fully coincide with the Anglo-Saxon concept of "intellectual property," and the Anglo-Saxon concept of "copyright" does not fully match with the French concept of "droit d'auteur," with the Spanish "derecho de autor," the Italian "diritto d'autore," or the German "Urheberrecht," just to give but a few examples. This theoretical gap translates as well into a practical one, the regulation and necessary criteria to obtain the protection of the same intellectual property rights widely differing across different legal systems. Moreover, along history, a range of diverse policy objectives, economic imperatives, and even ideologies and political organizations' structures have driven the adoption of diverging regulations of intellectual property. With these premises, it is clear already that any attempt at regulating intellectual property at the international level has been difficult and has come at a heavy price without a fully coherent and consistent system being established as of yet.

Though one might talk about the international governance of intellectual property in general, as already mentioned, intellectual property rights have different aims and disciplines both at the national and international level. Thus, for the sake of clarity, before turning to the historical evolution of the international governance of intellectual property, it seems appropriate to address briefly both industrial property and copyright and related rights' aims and disciplines in turn.

Within the category of industrial property, a patent is a document granted, upon application, by the State or a regional organization, giving the patent holder the exclusive rights to control the patented invention (i.e., the possibility to exclude others from commercially exploiting the invention through manufacturing, sale, and/or export). The exclusive control is generally granted, where certain conditions are met (the invention has to be a patentable subject matter, industrially applicable, new, nonobvious, and sufficiently disclosed in the patent application), for up to 20 years.

Industrial property also includes distinctive signs, that is, trademarks and geographical indications. A trademark is a sign that allows to distinguish goods and services of an enterprise from goods and services of another enterprise. In order to be protected, trademarks have to be distinctive and not to be contrary to morals and public order. A trademark owner has the exclusive right to use his trademark (and/or to license it to third parties). In turn, geographical indications (GIs) are signs used on products that have qualities related to their specifically identified place, area, or region of origin. Generally, those subjects that have the right to use a GI can prevent the use of the GI to others whose products do not comply with the specific GI (quality and/or place of origin) standards.

Lastly, traditionally industrial designs are also included within the industrial property category. Industrial designs protect the two-dimensional or three-dimensional visual appearance (i.e., ornamental or aesthetic elements) of a product. In principle, to be protected, industrial designs have to be new and original. Owners of an industrial design enjoy the exclusive right to prevent third parties from commercially exploiting their industrial design.

Copyright and related protect literary, scientific and artistic expressions, including articles, films, computer programs and advertisements. Copyright-related rights protect works such as choreographies, phonograms, musical interpretations and radio and television broadcasts. It is worth noting that copyright and related rights do not protect an idea, but the specific expression of an idea or the ways in which an idea is expressed insofar as it is original. Copyright commonly grants two types of rights: (i) moral rights, that is the right of the author to its noneconomic interests (recognition of paternity and preservation of the integrity of its work) and (ii) economic rights, that is the right of the copyright holder to obtain economic rewards from third party-uses of its copyrighted work.

The above-mentioned rights do not exhaust the list of intellectual inventions and creations protected. Besides plant breeders' rights and layout designs (topographies) of integrated circuits, other forms of protection of innovation concern undisclosed information or trade secrets and the protection against anticompetitive practices (through competition law or, depending on the circumstances, even under criminal law). Also, the advent and expansion of the Internet and the adoption of a *Domain Name System* (DNS) for the naming of resources connected to the Net have transformed domain names. From user-friendly Internet addresses used to locate computers, people, and resources on the Net, domain names have become business identifiers, thus potentially conflicting with trademarks.

It is not to be excluded that new intellectual property rights or forms of protection will come to life in the future, following technological progress, the ever-changing needs of our economies, and even paradigm shifts in the way our societies conceive culture and innovation.

## Historical Evolution of IP Protection

The idea of protecting creativity and innovation first emerged in the Mediterranean basin. Around 500 B.C., the sovereign of the Kingdom of Sybaris (located in what is now the south of Italy) granted creators the exclusive control (i.e., a "legal" monopoly) of their culinary and luxury creations. Somehow similarly, with regard to distinctive signs, Greek and Roman pottery bore marks that identified the maker of that particular pottery and its origin in order to distinguish it from copies. Later in time, more sophisticated traces of intellectual property protection can be found in the northern part of the Italian territory. Indeed, the first patent appears to have been granted to the famous architect Filippo Brunelleschi in 1421, while the first patent legislation in the world (the Venetian Patent Statute) was issued in Venice in 1474. Concurrently, on the island of Murano (within the then-territory of the Venetian Republic) the peculiar techniques used to create blown glass were jealously protected as a trade secret. On this point, one should not forget, however, that trade secrets had already successfully appeared in various forms in history, one of them being silk production in China.

With the creation of the printing machine in Central Europe, the discovery of the American Continent and the ensuing shift in economic power and creativity from the Mediterranean to Central and Northern Europe, a big change occurred. Among other countries, France and the United Kingdom took the reins in the furtherance and refinement of intellectual property protection. With its 1623 Statute of Monopolies the United Kingdom officially afforded patent protection to inventors, while France significantly molded the *droit d'auteur* in a way subsequently followed by several other countries.

At the end of the eighteenth and the beginning of the nineteenth centuries, the Industrial Revolution, with the creation of large-scale, standardized economies and related technical and technological

advancements represented both an element of expansion for intellectual property protection systems and posed a challenge in terms of creativity and innovation protection beyond national borders. The last straw pushing for an international concerted action on intellectual property was the lack of success of the 1873 International Exhibition of Inventions in Vienna (Austria), due to inventors' fears to be copied and lose their inventions' commercial advantages in other countries. This event made the need for international regulation of industrial property evident. Almost simultaneously, an international movement led by the French *Association littéraire et artistique internationale* and the famous writer Victor Hugo in person, driven by concerns about unauthorized uses and copies of literary works abroad, pushed for the negotiation of an international convention regarding copyright.

## The Current Status of International Governance of IP

The international negotiations of two separate conventions on industrial property and copyright, respectively, resulted in the adoption of the 1883 *Paris Convention for the Protection of Industrial Property* and the 1886 *Berne Convention for the Protection for Literary and Artistic Works* (both lastly revised and amended in 1979). These two conventions are undoubtedly the first two historical instances of international multilateral economic governance and the rules and principles they lay down still constitute the backbone of international intellectual property regulation.

In this sense, under Article 2 the Paris Convention, nationals of Contracting States are entitled to enjoy in other Contracting States "the same advantages that their respective laws now grant, or may hereafter grant, to their nationals," with regard to industrial property (national treatment obligation); further, under Article 4, the Paris Convention sets forth that where an application for patent, utility models, trademarks, and industrial designs protection is filed in one Contracting State, the applicant enjoys period of time during which if he applies in another Contracting State his application will be considered as if it had been made on the day of the first application (right of priority).

Somehow similarly, under Article 5 of the Berne Convention authors of one Contracting State enjoy the same rights that other Contracting States grant to their own nationals (national treatment obligation). The same provision provides that the enjoyment and exercise of these rights cannot be subject to any formality (i.e., authors receive automatic protection) and that the enjoyment and exercise of these rights by protected authors is independent of the existence of protection in the country of origin of the work.

Two Secretariats had been created to administer each of the two above-mentioned Conventions. However, in 1893, following the perceived need of a somehow common approach, the two Secretariats merged to form the *Bureaux internationaux réunis pour la propriété intellectuelle* (BIRPI). The creation of the BIRPI effectively set in motion the machine that led, in 1970, to the creation of (i.e., transformation of the BIRPI into) the *World Intellectual Property Organization*. In 1974, WIPO became the specialized agency of the United Nations working on intellectual property matters. Since then, WIPO has been one of the most active UN agencies, serving as a forum for:

(a) *The discussion of relevant IP issues, such as the link between IP and development and the adoption of the WIPO* Development Agenda in 2007.
(b) The negotiation and adoption of important treaties on IP rights (such as the Patent Cooperation Treaty, concluded in 1970) and on the harmonization of national regulations and procedures for the protection of IP rights (such as the Trademark Law Treaty, adopted in 1994).
(c) The discussion of problems and challenges to IP determined by the Internet and the digital economy, discussions that have resulted in important instruments (such as the s.c. "WIPO Internet Treaties," that is the *WIPO Copyright Treaty* (WCT) and the *WIPO Performances and Phonograms Treaty* (WPPT)).

(d) The resolution of disputes, through its Arbitration and Mediation Centre for domain-name disputes.

Its key role in the international governance of IP notwithstanding, WIPO has not been the only intergovernmental organization or UN agency working on IP matters. Other UN agencies, such as the *United Nations Educational, Scientific and Cultural Organization* (UNESCO) and the *World Health Organization* (WHO) have addressed IP-related questions relating their fields of actions, i.e., culture and health, respectively. Also, and more importantly, IP has always been connected to international trade. The link, already exposed at the multilateral level in the GATT 1947 (in its Article XX (d)), was later officially exposed with the creation of the *World Trade Organization* (WTO) and the adoption of the *Agreement on Trade-Related Aspects of Intellectual Property Rights* (TRIPS).

Though the TRIPS Agreement is administered by the WTO, it has built on and partly incorporated other IP conventions, such as the 1883 Paris Convention and the 1886 Berne Convention. The TRIPS Agreement contains some general obligations such as national treatment and most-favored nation (MFN) treatment obligations (Articles 3 and 4) that apply with regard to all IP rights it covers, i.e., copyright and related rights, trademarks, geographical indications, industrial designs, patents, layout designs (topographies) of integrated circuits and, though in a rather different way, plant breeders' rights and undisclosed information (Article 1). In this respect, it is worth noting that while the other two most important WTO Agreements (the *General Agreement on Tariffs and Trade 1994* and the *General Agreement on Trade in Services*) contain specific exceptions allowing for preferential treatment to be accorded within the framework of Regional Trade Agreements (RTAs), the TRIPS Agreement does not. This means that, in light of the MFN obligation in Article 4 of the TRIPS Agreement, any advantage granted by one WTO Member to another State in the framework of an RTAs with regard to IP protection has to be immediately and unconditionally multilateralized, i.e., extended to all other WTO Members. Also, the TRIPS Agreement requires a "minimum level" of protection for IP rights, but WTO Members may afford IP rights a more extensive protection than the one required under the Agreement, insofar as such protection is not inconsistent with the Agreement (Article 1.1). This is also in line with the principle, expressed in the same provision of the TRIPS, that WTO Members are free to choose the method of implementing the Agreement within their own legal systems.

Three last points concerning the TRIPS Agreement are worth mentioning. First, the TRIPS Agreement has to be interpreted and applied according to the objectives (including technological innovation and a balance of rights and obligations) and principles (such as the protection of public health or the promotion of public interest) that the Agreement lays down itself (Articles 7 and 8, respectively). Second, unlike the international IP conventions negotiated under the aegis of WIPO, the TRIPS Agreement explicitly addresses IP rights enforcement both within a WTO Member territory and at the border. However, whether TRIPS has a direct effect in WTO Members legal systems remains an open question. Second, any dispute regarding the rights and obligations of WTO Members under the TRIPS Agreement may be subject to the dispute settlement mechanism of the WTO. This means that, since the TRIPS Agreement partly incorporates the 1883 Paris Convention and 1886 Berne Convention, the dispute settlement system might be resorted to with regard to these conventions to the extent that they are incorporated.

The international regulation of IP provided by the TRIPS Agreement has brought to the fore a number of relevant questions. Among them, the protection of some IP rights such as GIs, and the relationship between IP protection and development and IP regulation and public health have been prominent. The sensitivity of this latter relationship has even led to the adoption of the Declaration on the TRIPS Agreement and Public Health at the 2001 WTO Doha Ministerial Conference. Also, while developed nations have not been fully satisfied with the TRIPS, arguing that

the Agreement has not done enough, developing and least-developed countries have generally complained that the Agreement has done too much, providing too strong a protection of IP rights. This wide dissatisfaction has led to international IP regulation being negotiated on a bilateral or plurilateral basis in RTAs (also called free trade agreements (FTAs) or preferential trade agreements (PTAs)) outside the WTO. As a result, nowadays, RTAs often contain s.c. TRIPS-plus and TRIPS-minus obligations, providing for a stronger and/or weaker protection of IP if contrasted with TRIPS obligations, respectively. In addition, IP rights are commonly included among protected "investments" under bilateral investment treaties (BITs) or the investment chapters of FTAs and are concurrently protected human rights under several conventions (being already included and referred to in the 1948 Universal Declaration of Human Rights).

The preceding considerations make it clear that, notwithstanding the key centralizing role of the WIPO and the WTO, current issues and questions concerning the international governance of IP are addressed as well outside international organizations.

## Future Perspectives on the International Governance of Intellectual Property

The general picture of the international regulation of IP currently appears fragmented and, at times, even contradictory. Different agendas are pursued by different actors and no unified, overarching goal has emerged as of yet. A brief look to the future reveals new challenges ahead.

The explosion of the Internet has raised the question of who should manage the Net. The answer is not foregone, bearing in mind that the managing organization of domain names, the *Internet Corporation for Assigned Names and Numbers* (ICANN), is controlled by one single country, the United States of America, while it is not an overstatement to say that its services affect the entire world. Also, the Internet and technological progress pose both great problems and great opportunities for IP – the idea to revise our conception of the entire system of IP rights is thus not to be excluded.

Moreover, similarly to other fields of international governance and law, the need to address rapidly emerging questions and the problems relating to reaching consensus at the international level has brought about the adoption of soft law instruments, i.e., nonlegally binding international instruments, on which common agreement might be more easily reached and that might develop into a legally binding instrument at a later stage.

Lastly, as noted, new trends are already verifiable in the international IP arena. On the one hand, thanks to technological innovation and the ensuing possibility to share and diffuse knowledge on a larger scale, open models where no single appropriation of literary and artistic contents (through, for instance, copyright), are becoming more and more common. On the other, while IP rights have commonly focused on and rewarded innovation and they have been based on proprietary models, attention is currently paid to traditional knowledge (TK). With its community-related dimension and open-control (to some extent) model, possibilities to apply IP to TK are currently explored.

[2]Università Alma Mater Studiorum, Bologna, Bologna, Italy

## Synonyms

Capability to work; Employment outcomes; Employment policies; Employment services

## Definitions

| | |
|---|---|
| Governance | Establishment of policies and continuous monitoring of their implementation by the members of the governing body. |
| Labour market services | Services to assist people in finding work, providing training, and facilitating contact between employers and those seeking employment. |
| Employability | The capability to move self-sufficiently within the labor market to realize potential through sustainable employment. |

## Introduction

The rapid changes in economic environment and the global economic crises are challenging the stability of labor markets; consequently, the issue of employability is assuming ever-greater importance. Careers are becoming more instable, and subject to changes, as consequence the ability of being employable is decisive for individuals. In the context of the governance of labor market, in particular, different actors are involved in the provision of services for workers, aimed at reducing unemployment. While the amount and the quality of services is the first output of the actors' network, the overall reduction of unemployment is the expected outcome of the overall policy. The conceptual connection between these outputs and outcomes is the employability, defined as the ability for individual to realize a sustainable working career path.

The aim of this work is to explain the concept of employability and its role within the public policies for labor market.

This contribution is organized as follows: after defining the concept of employability (Section "Definitions"), an historical excursus of this concept in the political debate is presented (Section "Introduction"). Section "Defining Employability" describes the employability as a personal resource, while section "Employability in the Political Debate: An Historical Perspective" assesses it as a component of the wider labor market. Section "Employability and Personal Resources" section presents some issues related to policy-making and the measurement of employability. Finally, the last section includes some concluding remarks (Section "Governing Employability").

## Defining Employability

Employability is a multifaceted concept that can be assessed from alternative perspectives. Nevertheless, the definitions of employability are about work and people's ability to be employed. A distinction between external and internal employability can be made. The first focuses on the career path that the person is able to achieve within a specific organization; in this context, employability is conceived as the capability of employees to maintain a job over time even changing roles and functions if necessary. The latter focuses on the career paths of people in the external labor market (among firms) and considers employability as the ability of individuals to access a first job and to find a new one in the labor market if this becomes necessary. In recent years, the attempt of literature has been to reach a definition that could include both the external and internal perspectives of employability.

Employability is "the capability to move self-sufficiently within the labour market to re*alize potential through sustainable employment*" (Hillage and Pollard 1998). Accordingly, employability refers simultaneously to the capability to gain initial employment, to maintain employment, and to obtain new employment, if required, both in the internal and external labor market. Moreover, employability is not reduced to the capability of a person to find and keep a job, rather it implies the possibility of gaining and maintaining a satisfactory job and achieving an adequate level of employment continuity, having more working experiences, and realizing a sustainable career growth in the long term. To complete the picture, other significant definitions of employability are provided in Table 1.

**Governance of Labor Market Services and Employability, Table 1** Definitions of employability in literature

| Authors (year) | Definition of employability |
|---|---|
| Hillage and Pollard (1998) | Employability is the capability to move self-sufficiently within the labor market to realize potential through sustainable employment |
| Lefresne (1999) | The probability, for a given group, at a given time, of finding a job or emerging from unemployment |
| Groot and Maassen (2000) | The capability to do different tasks to get a new occupation in the same organization |
| Harvey (2001) | Employability is the ability of graduate to get a satisfying job. Employability is a process of learning |
| Forrier and Sels (2003) | An individual's chance of a job in the internal and/or external labor market. |
| Fugate et al. (2004) | A form of work specific active adaptability that enables workers to identify and realize career opportunities |
| Fugate and Kinicki (2008) | A constellation of individual differences that predispose individuals to (pro)active adaptability specific to work and careers |
| De Grip and Sanders (2004) | The capacity as well as the willingness to be and to remain attractive in the labor market, by anticipating on changes in tasks and work environment and pro-acting on these changes |
| Van der Heijde and Van der Heijden (2006) | The continuously fulfilling, acquiring, or creating of work through the optimal use of competencies |
| Arnold and Rothwell (2007) | The ability to keep the job one has or to get the job desires |
| Berntson (2008) | Employability refers to an individual's perception of his or her possibilities of getting new, equal, or better employment |

## Employability in the Political Debate: An Historical Perspective

The concept of employability has established internationally since the 1990s playing a central role within the current public debate. Over the years, the idea of employability, however, has changed, according to different policy purposes, interventions, and target groups (McQuaid and Lindsay 2005). Table 2 synthetizes the main features of employability within the political debate, by distinguishing different phases of its historical evolution until 1990s.

In the early decades of the twentieth century, "dichotomic employability" and "socio-medical employability" were used to distinguish between "employable" and "unemployable" people, focusing on the differences between the work abilities of socially, physically, or mentally disadvantaged people and the work requirements of employment. This was a period characterized by a substantial economic growth and this simplistic version of employability was used exclusively to orient the public financial expenditures towards the integration of disadvantaged people. Between 1960s and 1970s, the economic situation dramatically changed, making the access to employment quite problematic. In this period, the term *manpower employability* was introduced in the policy discourse to identify the alignment/misalignment between a person's abilities and the skills required by the employers, while *flow employability* defined the probability that a person looking

**Governance of Labor Market Services and Employability, Table 2** The historical evolution of employability

| | 1970s | 1980s | 1990s |
|---|---|---|---|
| Questions | Employability seen as flexibility of a society | Employability seen as flexibility of a company | Employability seen as flexibility of workers |
| Purpose of employability | Full employment and decrease of collective financial burden | Efficient and effective human resource management without a lack or surplus of personnel | Individual opportunity for a job on the internal or external labor market |
| Interventions at what level | Central or local authorities | Public or private (larger) companies | Individual employees |
| Major target groups | School leavers without useful studies and underprivileged people | Large groups of personnel in lower and middle ranks in companies under reorganization | Everybody, employed or unemployed, who wants employment |
| Important measures and activities | Through governmental programs, employers are supported in carrying responsibility for employment by increasing the labor market qualifications of the people with a weak position in the labor market | The "flexible firm" implies the management of intraorganizational staffing problems, assuming both quantitative flexibility (number of periphery workers) and qualitative flexibility (employability or functional flexibility of core workers) | The individual's ability to cope with labor market problems implies career self-management that has to be encouraged by someone's employer. Companies will offer facilities to improve the responsibility and initiative of employees |

Source: Versloot et al. 1998

for a job could have of finding one. In this period, employability became an integral part of the labor market policy. The concept of *labor market performance employability* was also introduced to assess the labor market outcomes (measured in terms of hours worked, payment, and sustainability of employment) achieved by policy interventions to address employability. The period between 1980s and 1990s was characterized by an increased demand for flexibility by the employers and a substantial reduction of the employment security for individuals. Accordingly, at the beginning of the 1980s, the term *initiative employability* emerged, reflecting an acceptance amongst individuals and organizations that successful career development requires the development of skills that are transferable and the flexibility to move between tasks, roles, and jobs. The focus was on the individual responsibility, with the onus on workers to develop their skills and networks in the workplace, so strengthening their position when they wish, or are required, to move. In the same period, the concept of *interactive employability* also emerged, that maintained the emphasis on individual initiative, but acknowledging that employability is partially influenced by the rules and the behaviors of institutions governing and operating in the labor market.

In policy terms, "employability" formed one of the four original pillars of the European Employment Strategy from 1997, remained an important goal for the revised European Employment Strategy from 2003, and is expected to play an important role in achieving employment, education, and social targets in the EUROPE 2020 strategy. Since the late 1990s, employability has also emerged as one of the key political pillars of (and remains central to debates on) social and labor market policies in many EU states (e.g., UK, Nederlands, Denmark). In Denmark, in particular, training and retraining interventions aimed at promoting the employability of the unemployed are at the basis of the success of a flexicurity policy model, which was aimed at guarantee a balance between the flexibility required by companies and the security desired by workers. Employability has also assumed a renewed role in the current international political debate, as consequence of the changes of the labor market in the direction of greater flexibility and the negative effects that the recent international economic crisis has

generated on employment. By integrating the initiative and interactive perspectives, employability is now understood as both an individual and institutional responsibility. On the individual level, employability is deemed as an individual's own responsibility to acquire knowledge, skills, abilities, and other characteristics valued by current and prospective employers in order to become more employable. On the institutional level, different organizations that govern and operate in the labor market – e.g., employers, labor market intermediaries, and public authorities – should play a role for enhancing individual employability by providing adequate development opportunities to both unemployed and employed people, and support such development in a life-long perspective.

## Employability and Personal Resources

From the perspective of the individual, employability is built upon a number of personal characteristics, attitudes, skills, and abilities. Recent research focuses on identifying "employability skills" and those personal and transferable competences and attitudes that can increase individuals' employment chances by helping them to deal effectively with changes in the labor market. Accordingly, some personal attributes – such as resilience, anticipation and optimization, flexible cognition, entrepreneurship, career self-efficacy, and openness to change – seem to be particularly critical for employability.

These personal attributes include elements of human capital (know-how), social capital (know-who), and psychological capital (know why), which form a person's "movement capital," significantly influencing her/his chances of mobility in the labor market (Forrier and Sels 2003).

*Human capital* typically includes the set of knowledge, capabilities, and individual skills needed to be successful in the labor market. The degree of employability of a person depends in particular on:

- Professional knowledge and skills – related both to the specific role or to the sector domain – that are useful for getting and keeping a job, as well as for a carrier development within the organization;
- Transversal skills (i.e., reading, calculation, problem solving, leadership, communication, adaptability, group work, learning); these are qualities particularly appreciated by the majority of companies, whose possession guarantees greater simplicity of access and mobility in the labor market.
- The level of education and qualification, socio-demographic characteristics (i.e., age, gender, citizenship) and the physical and mental health condition, as well as the well-being of the person, which in turn affect personal motivation and the possibility of getting and completing a job.
- Knowledge and skills related to job search that may require, for example, market orientation, information on job opportunities, ability to use the main research channels, writing a curriculum vitae, and knowing how to present it into an appropriate manner.

To support personal employability, the importance of cultivating, maintaining and effectively using formal and informal ties is often emphasized. In this context, *social capital* is the set of relational and permanent resources that an individual can use, together with other resources, so as to pursue his professional goals. Social capital has a leading role on the process of job search: it is believed, in fact, that improvements in status in the labor market is positively affected by the individual number of social bonds (strong or weak), as well as by the ability to get in touch with many people.

Finally, *psychological capital* refers to individual character and personality that can condition the trajectories of employees' career progressions. In order to move successfully in the labor market – facing positively the changes, challenges, and difficulties, self-awareness (concerning strengths and weaknesses) is essential. At the same time, the role of motivation and career expectations appropriateness to the context are crucial (Fugate et al. 2004). Other aspects related to the psychological capital include a strong spirit of adaptation – that is the precondition to accept temporarily working conditions lower than expected – and the

development of a proactive attitude towards work and personal growth.

## Governing Employability

After introducing the concept of employability from the individual perspective, the next section focuses on the context in which the individual aptitudes of employability are rooted. In particular, moving from the individual perspective of employability to a systemic approach means recognizing that employability is not only about individual resources and attributes, but it is the result of process through which context-related and external factors affect the individual's chance of career progression in the labor market. The education system, the employers' practices, the activities of labor market intermediaries, and labor market policies are examples of external factors that may affect the development of human, social, and psychological capital.

Such a systemic approach can be explained through a policy and management cycle model in which the actors involved are characterized within an input-output representation of public service provision (Bouckaert and Van Dooren 2009). In this way, the governance of employability can be represented (Martini et al. 2017).

The policy cycle initiates through the identification of strategic public aims that are general end purposes derived from the policy statements. Such aims are then translated into operational objectives that are fulfilled within the management cycle. This second cycle embraces the conversion of the inputs into outputs through a transformation process that can be performed by public and private organizations engaged in providing services for labor market.

The inputs include the resources required to provide services – human capital, infrastructure, and finances – in contrast the output is the result of service provision. While the outputs are what the private or public actors do, the outcomes are the consequences of these actions, in terms of events, occurrences, or changes in the initial conditions, behavior, or attitudes of individuals. A further distinction can be made between intermediate outcome and final (or end) outcome focusing, respectively, on the accomplishments which are expected to lead to the final results and, on the ends of the policies ultimately desired.

Figure 1 includes an example of the translation of the general aim of reducing unemployment into programs for the development of job opportunities for young people (policy cycle) (Martini et al. 2017).

The actors involved in the policy cycle are national and/or local policy-makers. The program fulfilment requires the design and implementation of appropriate initiatives through the management cycle. In this second cycle, counselling, training, and career guidance services are provided. The output of this process is a number of young people that received these supporting services. The output becomes the intermediate outcome of employability, in the medium term that is expected to affect positively the end outcome of young people actually employed. In this perspective, employability is the intermediate outcome of the policy and management cycle model for the governance of labor market.

In the following subsections, we focus on the processes and actors of both the political and management cycle so as to show how the system can affect the development individual employability.

### Policy-Making for Labor Market

The chance for people to be able to increase their resources for employability over time depends on the virtuous interaction between personal commitment and the opportunities for professional growth offered by the social and economic environment of reference.

National and Local policy makers, in particular, are the actors in charge for the governance of the policy cycle of labor market. Through employment policies, and in particular active labor policy programs, policy makers can offer opportunities for personal resources development for employability through effective programs to support the unemployed and the weakest people in the labor market.

Two contrasting approach to policy-making for labor market can be identified (Lindsay et al.

**Governance of Labor Market Services and Employability, Fig. 1** The governance of labor market through the input-output model

2007): the Work-first approach, on one hand, and the Human Capital Development approach, on the other hand. The Work-first approach aims at reducing the period of unemployment and promoting rapid labor integration; in contrast, the Human Capital Development approach aims at encouraging active policy models focused more on the development of human capital and the support of the unemployed in a long-term perspective. Table 3 compares these approaches with a specific focus on the aims, the focus, main activities, relationship with the labor market, and human relationships.

The Human Capital Development approach seems to be the most suitable for the promotion of individual employability. In this venue, the most suitable interventions to support employability should:

- Provide for investments in training to strengthen professional and transversal skills, as well as assistance and support activities to ensure the effective integration of the worker
- Favor the quality of employment, rather than the speed of job integration, in order to guarantee job continuity over time, opportunities for learning and career
- Combine traditional support services and consultancy for job search, long-term training courses (basic, professional, cross-cutting, and continuous training)
- Integrate labor policies and welfare policies, so as to reduce the factors that can limit people's access to the market (i.e., welfare services to facilitate childcare, territorial mobility, social/health care)
- Rely on highly qualified personnel able to respond to the diversified personalized needs of the unemployed

Together with initiatives inspired by the Human Capital Development approach, the active involvement of different stakeholder represents a second important pillar for the development of policies able to support employability.

The advantages associated with policy initiatives based on cooperation between different actors have been widely demonstrated (i.e., McQuaid 2009). Such evidences highlight how most effective initiatives at local level in supporting employability are those that include, on one hand, the broad involvement of different stakeholders in the phases of policy planning and, on the other hand, the establishment of policy networks. Aimed at allowing the effective introduction of labor market policies, policy networks include public, private, and nonprofit actors that cooperate and share information and strategic resources through more or less formal agreements. These actors can be engaged in phases of both decision-making and services' provision. The governance models based on cooperative

**Governance of Labor Market Services and Employability, Table 3** Work-first approach versus human capital development

| | Work first | Human capital development |
|---|---|---|
| **Aims** | Facilitate the access (and re-access) in the labor market, through short-term search and training (instrumental to employment) | Improving the employability and the work path of the individual in the long term, through continuous training and assistance services |
| **Focus** | Immediate access to the labor market and reduction of the unemployment period | Sustainable transitions in the labor market and career paths in the medium to long term |
| **Main activities** | Constant search activity, Short-term training, instrumental to the work activity | Long-term training activities, assistance services (family, transport, health, etc.), personal and specialized tutors |
| **Relationship with the labor market** | Responding to the needs of businesses, through the placement of job seekers in the jobs available on the market | Increase the skills and professionalism of job seekers, broadening the range of job opportunities, encouraging and supporting the creation of growth paths in the workplace |
| **Human relationships** | Use financial sanctions and/or incentives to encourage immediate access to the labor market | Encourage job seekers to participate in training activities, emphasizing the benefits of higher quality job opportunities |

approaches both in the planning and in the implementation phases, demonstrated to guarantee, over time, a better understanding of the needs of the population, a better definition of the objectives and actions to be undertaken, and the realization of innovation processes in services and interventions realized with the guarantee of a rationalization of costs.

The next section focuses on the role of the actors of these policies network, with a specific attention on those involved in the management cycle.

## The Actors of the Management Cycle

The actor involved in the management cycle are the labor market intermediaries (LMI) – temporary work agencies (TWAs), Public Employment Services (PES), Nonprofit Organizations (NPOs) – as well as private firms. In particular, TWAs, PES, and NPOs provide services aimed at favoring human capital development directly, while private firms give to workers the opportunity to develop skills and competences on-the-job.

LMIs are entities or institutions that interpose themselves between workers and firms to facilitate, inform, or regulate how workers are matched to firms; how work is accomplished; and how conflicts are resolved. Their role in the labor market is growing taking place along two different lines. On one hand, LMIs carry out their activity in the private market by offering matching, placement, and other human resource services to client companies and job seekers. On the other hand, LMIs – Public Employment Services in particular – operate within the policy cycle by offering support for the implementation of employment policy programs.

In particular, with reference to the first line of activities, LMIs play a critical role in sustaining individuals' employability mainly through: (1) matching and placement services, and (2) career support services (Benner et al. 2007).

1. Job matching consists in linking workers interested in new jobs with employers seeking to hire new employees. A precondition for individuals to be employable, at least in the internal labor market, and to get development opportunities on the job, is represented by the performance that they are able to carry out in the workplace. LMIs should boost workers' performance on the job by providing an effective matching. The latter, in turn, depends on the accuracy of the recruiting and selection activities, the extent to which the LMIs inform candidates of both available employment opportunities, and the techniques and tools used when selecting job applicants. In this

perspective, LMIs should support the effectiveness of workers on the job also offering placement services, including on-the-job-assistance, to check the progress made on the job and to solve any emerging problem with the employer, as well as extra-work assistance (i.e., social and welfare services), to facilitate the access to work of disadvantage people and work-life balance.

2. LMIs, particularly in the public and nonprofit sectors, manage activities that go beyond their basic matching-making role and that support people to achieve a career progression in the labor market. LMIs invest on human capital by providing pre-employment training designed for workers who are particularly disadvantaged in the labor market, life-long training, focused on developing of soft skills needed by people with limited labor market attachment, and vocational training, to fill up the gaps between the technical skills of prospective workers and the requirements of firms. Moreover, LMIs can support the development of the Social and psychological capital of disadvantaged people. In this venue, LMIs provide networking initiatives that allow the creation of contacts between candidates and potential employers increasing their chances to get a job, counselling and coaching programmes to support workers in achieving specific personal and professional goals, and job search support for promoting individual autonomy when looking for a new job.

Private firms that hire personnel also play a critical role in enhancing workers' employability as employers. Indeed, workers' employability can improve over time if they are engaged in different type of developmental activities in the workplace that enhance workers' suitability for work within and outside the organization. Companies may adopt a wide range of human resource and work design strategies and practices to develop the skills, competences, knowledge, and attitudes of employees and help them face fluctuating demands for numerical and functional flexibility. In this perspective, employability becomes a critical requirement for enabling competitive advantage at the firm level, as it might supplant long-term job security as the basis for reciprocal commitment from employees. In particular, studies on High Performance Work Systems (HPWS) highlight that promoting and making space for skills development to enhance employability can increase the employers' ability to attract, motivate, and retain valued employees. Moreover, a broader societal effort to encourage employability can generate strategic advantage to the firm through the development of intangible assets, as well as being of broader societal value.

In order to enhance workers' employability, the human resource management practices considered most effective largely concern training activities, job design, and career development support. Firstly, training activities are aimed at updating employees' knowledge, skills, and abilities. Accordingly, workers' employability can grow depending on the amount of training provided by the employer, distinguishing between training in general skills – which can be used both within and outside the company – and training in job-related skills – which are useful in the current job or in a similar job. Secondly, the opportunities for employees to develop their employability also depend on how work is designed by the organizations. Indeed, workplace learning encompasses both informal and nonformal learning embedded in the workplace, in job-related processes and tasks, and may be fostered through job rotation, workgroups, task variety, and/or challenging jobs. Employers can promote workplace learning also by expanding internal mobility opportunities and stimulating horizontal and vertical flows, i.e., flow to other functions on the same level (horizontal) or to a different level (vertical) in the organization. Finally, workers' employability can occur also as result of career development support and on the extent to which supervisors encourage their subordinates to work on their careers and develop themselves. Employers can ensure career development support in many ways. For example, they can provide coaching and mentoring initiatives, helping employees in developing critical skills and expertise, as well as design performance evaluation systems and implement consequent improvement plans. They can further offer

counselling and outplacement services, aimed at helping their employees clarify their career expectations, broadening knowledge of the labor market and bringing individuals into contact with the right networks.

## Measuring Employability

The governance of employability requires the implementation of a performance measurement system able to support policy-makers in the definition and the implementation of labor market policies. Different performance indicators can be derived from the input-output model focusing, alternatively, on input, output, intermediate outcome, and end outcome indicators (Bouckaert and Van Dooren 2009), and through the comparisons of the model's items, some indicators can be formulated, measuring different dimensions of productivity, economy, efficiency, effectiveness, and cost-effectiveness. Irrespectively of the focus of performance measurement, the characteristics of trustable indicators have been widely discussed. The usefulness of performance measures, in particular, depends on their reliability, validity, verifiability, intrinsic cost-effectiveness, relevancy, comparability, and aptitude to be attributable.

With the aim to assess the relationship between employability and employment in the context of the labor market policies and governance, a specific focalization on both the nature of the indicators of intermediate and final outcomes, and the effectiveness assessment is provided. In this context, the distinction between lagging and leading indicators is crucial. Different authors in the field of strategic management, public policies, economics and finance, and operation management, highlight the different nature of leading and lagging indicators. Lagging indicator are measures focusing on results at the end of a period, normally characterizing historical performance. Even if they are normally easy to identify and capture, their historical nature is not able to reflect current activities. According to Kaplan and Norton (1996), in the development of balanced scorecard, Lagging indicators and long-term strategic objectives are formulated for the strategic core issues of each perspective derived from the strategy of the business unit. Lagging indicators thus indicate whether the strategic objectives in each perspective were achieved. In contrast, leading indicators are performance indicators able to predict the outcomes. They are measures driving the performance of lag measures, normally focusing on intermediate processes and activities. Even if they are difficult to identify, leading indicators are predictive in nature and, facilitating the introduction of possible adjustments, they monitor if the tasks are being performed that will "lead" to results. In contrast, lagging indicators monitor whether the results or outcomes that have been achieved.

With a specific reference to the measures of employability, the distinction between objective and subjective approach is significant (Forrier et al. 2015). An objective approach measures employability considering the employment outcomes achieved by individuals in the labor market, and a subjective approach that focuses on the individual belief about their employability. Following the discourse on the policy and management cycle, objective measures of employability (i.e., transitions achieved in the labor market, employment continuity, employment conditions, perceived career success) are the final outcomes of a policy program aimed at promoting employability, while the subjective measures, also referred as perceived employability, are the intermediate outcomes that may predict individuals' employment outcomes. In this vain, employability has to be considered an intermediate outcome that mediates the relationship between supportive services for labor market (the output) and final outcome (the reduction of unemployment rates). Such an intermediate position in the policy and management cycle suggests that employability measures act as leading indicators able to predict the overall performance of public initiatives aimed at reducing unemployment, and measured with lagging indicators. In the following, some examples of measures of employability belonging to the two approaches are presented.

The underlying assumption of the objective approach is that a person who is able to move in the internal and the external labor market and to

achieve a successful career over time is more employable. Accordingly, the objective approach measures employability considering the transitions that an individual achieves in the labor market. The starting point is represented by one initial employment situation. This assessment allow to distinguish between employed and unemployed people, or even consider different unemployment and employment conditions, by the unemployment duration, type of employment contract (i.e., temporary employment contract vs. permanent employment contract), job tenure, hierarchical positions within the organization, payment, etc. The degree of employability is than measured by looking at the employment transitions that a person has achieved in the external and internal labor market, including shifts from unemployment to employment, from one job to another job, from a temporary job to a permanent job, or even changes in roles and hierarchical positions within the organization. Moreover, within the objective approach, some authors consider every transition to or between jobs as an indication of employability, while others only look at the transitions that allow an improvement of the employment conditions, in terms of salary, job position, job security, and career prospects. The underlying assumption of this second group of researchers is that who is employable is not only able to find a job, but in addition their job is "fulfilling." Likewise, a broader interpretation of employment outcomes takes account of individual career aspirations assuming that those who have a job that fulfils their wishes demonstrate employability (Forrier and Sels 2003). Adopting this interpretation requires the use of more qualitative and inevitably, more subjective indicators of employability. Subjective career success, for example, measures individuals' satisfaction on how well their past career met a range of criteria important to them in terms of skills development, professional growth, employment continuity, and income (Arnold and Rothwell 2007), where past career outcomes can be considered a proxy of the degree of worker's employability.

A subjective measure of employability, also considers perceived employability, focusing on the individual's perceptions of available employment opportunities with the current employer and/or in the external labor market. Perceived employability is widely diffused in the organizational literature as it is portrayed as an upcoming critical resource for workers in times of high job insecurity providing them with a sense of career self-management and promoting a proactive attitude vis-à-vis changes in the internal or the external labor market. An important distinction can be made between internal and external employability. With reference to the internal labor market, perceived employability concerns workers, considering their expectations of maintaining and/or changing job within their current employer. Employability in the external labor market refers to workers and unemployed people, focusing on their belief regarding the likelihood of finding a new and a better job in the labor market (with a new employer). Another stream of subjective measure of employability is defined "competence-based." It has been developed in the field of psychology and requires that individuals evaluate their employability skills and motivational attitudes. Competence-based measures mainly focus on personal resource for employability and assess individual perceptions about human, social, and psychological capital (i.e., Van der Heijde and Van Der Heijden 2006). Different types of measures have been developed in this area, each focusing on different set of personal resources. The most widespread measures include self-assessment of transversal skills (i.e., confidence, problem solving, interpersonal skills, communication), personal traits (i.e., openness to work changes, self-efficacy, career adaptability, and resilience), work culture, social networks, and knowledge of the labor market (i.e., job search techniques, information on available job opportunities). In order to increase the reliability of the subjective measures of employability, the opinion of direct supervisors in the workplace has been added in some empirical studies.

## Conclusion

From the systematization of the contributions on employability, an indication of rethinking

work – not as a static position but as a professional path made of different opportunities – is emerging. One of the most critical elements that employability evokes is the need to find a balance between the flexibility required by employers, on the one hand, and the security needed by people, on the other. Moving from the concept of employment to that of employability requires an effort, a commitment and a cultural change that involves all the actors of the labor market: people, businesses, LMIs, and public institutions.

First, people can no longer count on the "lifelong" employment and on a linear career progression within the same organization; in contrast they undertake working careers that realize in different jobs, organizations, and economic sectors. In this context, the term flexibility should be understood as availability, on the part of the workers, to update and adapt their knowledge, know how to match the demand side of the labor market, and feeling empowered in their own working life. A new approach to work is then required for employability that is rooted in a culture based on continuous learning. Secondly, companies are no longer able to guarantee the employment security to workers and should reciprocate the commitment, loyalty, and trust of their employees throughout the supply of adequate opportunities for growth and professional development. However, this is not just a mere problem of social responsibility, but rather it should be a deliberate strategy that can lead to achieve positive organizational performance in the long term.

Thirdly, labor market intermediaries, whether they are private, public, or nonprofit organization, have a critical role to play in sustaining workers long-term employment outcomes. In this perspective, LMIs should provide professional employment services – placement services, support for employment continuity, human and social capital development, career guidance, and active job search – that go beyond the simple intermediation of jobs, supporting people disengaged from the labor market, those in transition, and employed persons, to improve their employability all along their professional career.

Finally, the public institutions must identify and apply policy systems that are capable to jointly ensure economic development and social protection. They are therefore asked to design labor policies aimed at supporting flexicurity, thus trying to balance the flexibility required by companies and the security needed by individuals.

Supporting employability, in fact, implies a certain degree of innovation in the models and systems of governance of labor policies and services and in active policy programs defined at national, regional, and local levels. The collaborative effort required of the four actors can generate virtuous circles. This, in particular, should make possible to overcome the traditional models of labor market policy, based on a "hierarchical" logic and without necessarily slipping into an extreme "market" logic. In this venue, it could left a more decisive openness to the bottom-up approach for the governance of employment policies, that promote the participation of different stakeholders and public, private, and nonprofit institutions, in all strategic phases of definition, planning, and implementation of policies. To ensure employability rather than employment, an innovative approach is also required in the design of active labor market policy programs. These policies should focus on the medium- to long-term development of human, social, and psychological capital and aim at supporting the people's ability to find and maintain good jobs and to achieve sustainable working careers paths over time.

## Introduction

Migration has emerged as a key issue for governments in the twenty-first century. While multiple disciplines address migration, the study of public administration (PA) has been slow to do so. Given the complexities of migration policy implementation, and the multiple levels of government involved, PA can add significantly to current understandings of the phenomenon. This entry examines what is known on migration, what still needs to be understood, and how PA can assist in understanding migration.

Migration policy is complex because it involves multiple levels of government, multiple nonprofit and private stakeholders, and is not an issue that can be understood, analyzed, and dealt with in an isolated fashion, i.e., as if it is something that is not embedded in a larger political, social, cultural, and economic environment. The study of public administration (PA) can add significantly to the current understanding of the nature of migration and the challenges that migration policy faces, so that policy makers can develop more holistic policies. Migration is directly connected to key PA concerns, including but not limited to street level bureaucrats, local level implementation, social equity, wicked problem analysis, the effects of globalization on domestic government policies, and – as an approach – comparative PA. Moreover, as domestic considerations continue to matter in a transnational space, it is important to consider policy

implementation within a domestic/international continuum and, thus, migration implementation within this framework.

## What We Know

There is much research into migrant patterns and statistics, causes of migration, and types of migration and government control. While this entry will briefly review contemporary migration patterns, the literature on the history of human migration is vast and will not be summarized herewith (see, for accessible overview, Manning and Trimmer 2013).

## Migrant Patterns and Statistics

The modern migration era is often cited as beginning in the middle of the twentieth century, after World War II and before the oil crisis of 1973 (Keeley 2009; Koser 2007). Massey (1999) divides modern international migration history into four periods, starting in the 1500s and continuing into the twenty-first century. He identifies the postindustrial migration period, beginning in the 1960s as the fourth and latest migration era. In his interpretation, migration only began to occur on a global scale within the last 50 years, with immigrants moving from countries in Africa, Asia, and Latin America, or the developed world. In the previous period (1830s–1950s), the majority of migrants originated from Europe. Segal et al. (2010) argue that a fifth period is developing at the turn of the twenty-first century. While immigrants still originate from across the globe, increasing economic interdependencies have widened the gulf between the rich and the poor, causing developed countries to tighten immigration policies. This has both direct and indirect effects on individual decision-making.

News media in the past several years report on migrant flows with vivid images of people in distress. With these images, some citizens in receiving countries have the impression that they are "flooded" with migrants. On the surface, the numbers of migrants seem to reinforce this impression, as the world has experienced a 49% increase in international migration since 2000. In 2017, approximately 258 million individuals lived in a country outside of their birth. However, this accounts for only 3.4 percent of the world population, a 0.6% increase in the number of international migrants globally since 2000. Of these, 25.4 million are refugees; and another 10 million are stateless people (United Nations High Commissioner for Refugees 2018).

## Reasons for Migration

Theories about why people move to other countries range from neoclassical economic understandings to historical-structural explanations connecting globalization to migration (knowledge of opportunities elsewhere, the Internet, etc.) and to theories centering on migrants themselves.

Neoclassic economic theories generally explain migration in terms of economic push-pull models, based on the idea that stark inequality between countries acts to motivate individuals to migrate. Push factors include poverty; unemployment; (perception of) overpopulation; political and religious repression by government through torture, detention, and killing (e.g., China, El Salvador, Cambodia, Somalia); natural disaster; and (civil) war. Another push factor concerns a country's incapacity to govern and the extent of corruption. Pull factors include the search for personal advancement (job opportunity, moving to country with rapid economic growth) and/or improving family life (e.g., sending earnings to family back home), the search for political and/or religious freedom, the search for educational opportunity (through, e.g., study abroad) (see, e.g., Sabharwal 2011, 2013), active outreach of developed countries seeking foreign labor to counteract dropping birth rates and aging populations, existing family links, and just plain curiosity.

More recently the reasons for migration have been examined as larger household coping mechanisms, where the choice to migrate is made by the larger household rather than an individual. As such, migration serves as an important coping mechanism for shocks, such as natural disasters or economic instability (Murrugarra et al. 2011). The concept of migration as self-fulfilling can be

found in social network theory that examines social capital, transnationalism that examines formation of identity, and migration systems theory that examines exchange structures as mechanisms that affect migration paths (Castles et al. 2013; Glick Schiller 2013; Kritz et al. 1992; Massey et al. 1999). De Haas (2010) argues that while migration is a process with its own dynamics, it is also an important component of larger development processes. As such, migration processes affect not only future migration processes but also development processes. Lokshin et al. (2011) found that to decide whether to embark on migration, households in Nepal compare expected net benefits of each receiving location and select the location with the highest utility payoff. Thus, migrating within or outside Nepal is largely dependent on the exposure of migration networks, household characteristics, and household location.

While these theories focus on voluntary migration, forced migration is also an important concern for governments. State fragility or the inability of a state to protect its citizens is argued to be the cause of most forced migration. Global factors increasing state fragility include the end of the Cold War, the spread or imposition of democracy in countries that have little to no experience with it, increases in technology that are destabilizing as people know much more about living standards elsewhere, the increased value of natural resources (Betts and Collier 2017), and predatory globalization (Falk 1999; Farazmand 2017, 214). What is known as neoliberalism in the guise of the Washington Consensus refers to a hard to untangle mix of privatization, outsourcing, dropping expenditures for public goods, tightening of financial discipline, free flows of capital, control of organized labor, and tax reductions, among many other things (Falk 1999, 2). The complexity of various business arrangements is so large that it is very difficult to recognize their predatory character. The subprime mortgage market developed by high finance is a good illustration of this (Sassen 2017). Since the 2010s, and across the political spectrum, various scholars have warned against "regulatory capture" (Stiglitz 2013, 59), "repatrimonialization of the state" (Fukuyama 2014, 28), and "corrosive capture" of the state (Hacker and Pierson 2016, 93).

## Migration Policy as Messy, Complex, and Divergent

Despite all that is known about migration, there has been little systematic research on the administration of migration policy for a number of reasons. These include the multiple levels of government in which migration must be addressed to ensure successful implementation of migration policy (Larrison et al. 2019), as well as the varying types of migration that must be addressed in terms of both migration control and migrant integration.

Migration policy is defined at all levels of government.

## International Engagement

A number of United Nations (UN) agencies are involved in addressing migration, such as the United Nations High Commissioner for Refugees (UNHCR), the International Organization for Migration (IOM), the International Labor Organization (ILO), the UN Development Program (UNDP), and the UN Department of Economic and Social Affairs (UNDESA). In addition, international organizations, such as the Red Cross, humanitarian organizations, and international financial institutions, such as the World Bank, are also concerned with migration issues.

At the beginning of the twenty-first century, international engagement addressing the governance of migration exploded in the form of international cooperative dialogues with states at the forefront. The most prominent include the Berne Initiative in 2001, the Global Commission International Migration (GCIM) in 2003, the Global Forum on Migration and Development (GFMD) began in 2006, and the UN High-Level Dialogue on Migration and Development that began meeting in 2007 and continued through 2013.

## Regional Engagement

The regional economic integration frameworks address economic mobility and liberalization and include the Southern Common Market

(MERCOSUR) with five member states, the Economic Community of Western African States (ECOWAS) with 15 member states, the Southern Africa Development Community (SADC) also with 15 member states, and the European Union (EU) with 28 member states.

## Bilateral Agreements

Beyond international and regional governance components, states can employ form and/or informal bilateral agreements. These are often less associated with international governance concerns and more closely connected to the goals states pursue unilaterally.

Under bilateral agreements, a state does not cede the power to determine issues around the migration process, but instead comes to an agreement with another state affected by the migration process.

## National Policy

Migration policy at the national level assumes the presence of a sovereign [receiving] state with the capacity to control migration processes. The state then has a number of mechanisms at its disposal to affect the decision-making processes of the economic migrant. These may be direct, such as documentation and identification including national passports and visas that authorize states to control movement across borders, border control by police or state military and the building of surveillance systems and fences, and the ability to retain and return migrants. Policies may also be indirect, such as tailoring foreign assistance to increase economic growth in sending countries, or using military or diplomatic channels to affect change.

## Local Policy

While national migration policy principally focuses on issues of control, local migration policy largely addresses implementation and integration efforts. As such, many of the policies implemented at the local level are palliative in nature (Larrison et al. 2019). Often, local palliative policies are pursued in public-private-nonprofit partnership.

## Migration Classification Within Policy

Beyond the level of government in migration policy-making and implementation, the type of migration affects how policies are made and implemented. While the complexity of migration creates difficulty in rendering an accurate analysis of all types and policies, governments largely distinguish between highly skilled migration, low-skilled migration, irregular migration, and forced migration in policy-making.

Public opinion in receiving countries also affects migration policies and implementation. In Gallup polls conducted between 2012 and 2014 of over 183,000 adults worldwide, 52% of Europeans, 40% of Africans, 39% of Latin Americans, and 39% of North Americans believed immigration levels should be decreased in their country (International Organization for Migration 2015). At the forefront today are tensions between anti-immigrant public opinion and national interests of economic growth and global competitiveness that often require immigrant labor.

Given the multiple levels of government, the multiple types of migration, and the concerns within the state and among the public regarding the issue, migration policy-making is complex, messy, and divergent. Implementation of migration policy is equally so but is far less studied and understood. Global problems cannot be addressed by domestic effort or intergovernmental collaboration only.

In practice we must recognize that state capacity actually varies with national political culture and atmosphere and with the extent to which the state has deregulated its oversight of the market. Attention for policy-making and implementation tends to focus either on the international or the national level. Migration is actually a policy area of which issues and challenges not only play at all levels of national and international governance but a policy area where (re)solution of issues and challenges assumes the development of transnational policy communities and regulatory frameworks. Indeed, we need to look at

migration as a multilevel, multi-actor policy field that connects the international and global with the domestic and local scenes of response (see Larrison et al. 2019). Finally, PA scholars could go beyond administrative questions only and address the administrative challenges in the larger context of international and domestic political and economic developments. No policy or policy tool can be of any use, unless it is developed and implemented in a context that is favorable to helping migrants in a longer-term perspective (as is argued in Larrison et al. 2019). This means that PA scholars should not only focus on structure and functioning of government and its public servants itself but also include attention for government in society. Policies will have benevolent outcomes when the larger political and economic environment in origin and destination countries is conducive to that. In fact, only government has the regulatory, administrative, and authoritative capacity to develop an effective, efficient, and equitable migration policy. Only a strong government-driven oversight and regulatory framework can assure that private corporations are kept in check. Predatory globalization is only possible in a political, social, and economic framework of institutional arrangements where government has abdicated its responsibility of looking after people and society as a whole through deregulation (Piketty 2014, 260–261, 297). Surely, there is more PA can do, but what is suggested above will keep its scholars busy for quite a while. It is time to get started, because the administrative challenges of international migration flows are not to diminish any time soon.

# Governance of Ocean Beyond National Jurisdiction

Md. Mostafa Hosain
School of Law, BRAC University, Dhaka, Bangladesh

## Synonyms

Area Beyond National Jurisdiction (ABNJ); Maritime zone of high sea and the area; Ocean spaces outer the continental shelf and EEZ; Water area beyond jurisdiction of States

## Definitions

| | |
|---|---|
| ABNJ | According to UNCLOS, ABNJ includes high sea covering water column of the ocean beyond 200 nm from the baseline and the area which consists of the ocean floor, sea bed, and subsoil of area beyond outer limits of continental shelf. |
| Bioprospecting | Article 1, Act No 10 of 2004 of National Environmental Management Biodiversity Act of South Africa defines bioprospecting as "any search on, or development or application of, indigenous biological resources for commercial or industrial exploitation, and includes the systematic search, collection or gathering of such resources or making extractions from such resources for purposes of such research, development or application." |

## Introduction

Ocean covers seven tenths of the planet (World Ocean Assessment I, 2016). It is highly diverse with resources and rich variety of organisms apart from having immense significance for the transportation. Accommodating habitat of diverse forms of unique life forms like hydrothermal vents, cold water seeps, seamounts, and deep-water coral reefs have enhanced the significance of ocean and its regulation (Tullio Scovazzi 2010). Oceans host around 32 phyla on earth out of the discovered 34. Living organisms of around 6000 m below the sea level are considered potential sources of novel bioactive compounds for their extreme surviving conditions. In recent years, with the advancement of new technologies, international community has become increasingly aware about marine ecosystems and its rich biodiversity particularly of Areas Beyond National Jurisdiction (ABNJ). It is undoubted that the future resources and opportunities will be surrounded with the ocean. The urge of governance of ABNJ has been quite long (R. Y. Jennings 1971). The current principal legal regime of governing ocean is the United Nations Convention on the Law of the Sea (UNCLOS) 1982. However, the convention does not provide any clarity on the regulation of biological resources in ABNJ including bioprospecting, status of genetic resources, etc. Although the preamble of the convention mentions "living resources," it has not been

further elaborated in the operative body of the convention to cover MGRs and processes. Countries having technology to explore the resources and thereby commercializing have already indulged in activities of such nature.

Therefore, it is very demanding to have proper governance mechanism in ABNJ. Before considering of a proposed legally binding instrument, it has to be kept in mind that the successful management of any activity requires an adequate understanding of the activity and of the context in which it takes place (WOC I, 2016). The present study will depict available legal and institutional mechanism for regulating ABNJ.

## International Instruments on Ocean Governance

### UNCLOS and Implementing Agreements

UNCLOS, also called the Law of the Sea Convention or the Law of the Sea treaty, is the international agreement that resulted from the third United Nations Conference on the Law of the Sea (UNCLOS III), which took place between 1973 and 1982. The Convention provides a comprehensive regime of law and order in the use of ocean and resources therein. It is considered as the cornerstone in the field of international law of the sea and the constitution of the ocean (Tullio Scovazzi 2010). It advocates that issues of ocean area are closely linked and connected. It also provides legal framework to comprehensively address the protection of marine biodiversity (Kamrul Hossain, 2016).

The UN Agreement for implementing provisions of UNCLOS pertinent to the conservation and management of Straddling Fish Stocks and Highly Migratory Fish Stocks is another instrument governing the fishing resources of the ocean. The agreement lays down principles for the conservation and management of those fish stocks and also establishes that the management must be maintained on the basis of precautionary principle and available scientific information. It urges States to cooperate in conserving and promoting optimum utilization of fisheries resources both within and beyond the area of EEZ.

In order to mitigate the difficulties of seabed mining provisions under Part XI of UNCLOS, a series of informal consultations were convened in 1990 which helped in adopting the Agreement in July 1994 which entered into force in July 1996. The agreement mainly deals with the procedural aspects including signature, entry into force, and provisional application.

### Geneva Conventions

On 29 April 1958, the United Nations Conference on the Law of the Sea opened for signature of four conventions and an optional protocol. The first one is the Convention on the Territorial Sea and the Contiguous Zone (CTS) which sets out in detailed provisions the main rules on the territorial sea and the contiguous zone. The next is the Convention on the High Seas (CHS) which defines the high seas as all parts of the sea not included in the territorial sea and internal waters. It also contains two early and pioneering provisions on pollution by the discharge of oil and of radioactive wastes. Third is the Convention on Fishing and Conservation of the Living Resources of the High Seas (CFCLR). It focused upon principles and mechanisms for the rational management of fisheries in the high seas. It insists upon cooperation between States engaged in the same fisheries, recognizes the special interest of the coastal State when the fisheries are in the high seas adjacent to its territorial sea. Fourth is the Convention on the Continental Shelf (CCS) which sets out rules on the notion, limits, and regime of the continental shelf.

### CBD and Nagoya Protocol

CBD is the global key instrument to conserve biological resources of the planet. The convention got the largest number of ratification from all over the world. In the same vein, the Nagoya Protocol on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from their Utilization to the Convention on Biological Diversity provides mechanism for the access and benefit sharing mechanism if biological resources are being utilized. For the governance of ABNJ, both instruments have jurisdictional limitation in terms of their application

within the national sphere only. Although they are inapplicable, the *modus operandi* and mechanism of regulation of resources provided in both instruments can be of great useful to adopt any pertinent instrument for the governance of ABNJ.

Regional instruments and mechanisms are brought for specific areas with specific purposes. The Antarctic Treaty System (ATS) is one of such mechanisms to ensure conservation of ecosystem and adopt precautionary approaches in order to initiate activities in the Antarctic area (Vierros and Arico 1997). The principles and contents of ATS would be relevant in the context of adopting a mechanism for the ABNJ.

## Governing Principles of ABNJ

### Common Heritage of Mankind

The development of the principle of common heritage of mankind was driven by three key factors which are determining the status of the sea-bed (ensuring that world community as a whole is the owner of the sea-bed, the demand that the marine resources should be used for the benefit of the developing countries, and the establishment of a respective institutional regime (Rüdiger Wolfrum, 1983)). The Preamble of UNCLOS clearly declared the purpose and prospect of the principle of common heritage:

> Desiring by this Convention to develop the principles embodied in resolution 2749 (XXV) of 17 December 1970 in which the General Assembly of the United Nations solemnly declared *inter alia* that the area of the seabed and ocean floor and the subsoil thereof, beyond the limits of national jurisdiction, as well as its resources, are the common heritage of mankind, the exploration and exploitation of which shall be carried out for the benefit of mankind as a whole, irrespective of the geographical location of States.

In the same tune, Article 136 of UNCLOS states that the Area and its resources are the common heritage of mankind. It has been committed further by States in Article 311 (6) that States Parties agree that there shall be no amendments to the basic principle relating to the common heritage of mankind set forth in article 136 and that they shall not be party to any agreement in derogation thereof. However, the rules of common heritage of mankind are related to minerals of the Area including manganese, cobalt, nickel, nodules, etc. According to Tullio Scovazzi, the common heritage of mankind regime under UNCLOS does not include the nonmineral resources of the Area (Tullio Scovazzi 2010).

### Freedom of High Sea

Traditionally, the activities including freedom in the high sea has been influenced by the principles of free use and exclusivity of flag state jurisdiction (Churchill and Lowe 1999). Article 87 of UNCLOS provides about the freedom of the high seas as the high seas are open to all States, whether coastal or land-locked. Freedom is exercised under the conditions laid down by this Convention and by other rules of international law. It comprises, inter alia, both for coastal and land-locked States: (a) freedom of navigation; (b) freedom of over flight; (c) freedom to lay submarine cables and pipelines, subject to Part VI; (d) freedom to construct artificial islands and other installations permitted under international law, subject to Part VI; (e) freedom of fishing, subject to the conditions laid down in section 2; (f) freedom of scientific research, subject to Parts VI and XIII. The freedoms are not exhaustive in both 1958 Geneva Convention as well as 1982 UNCLOS (Churchill and Lowe 1999). In fact, developing countries have rejected to this freedom during 1960s and 1970s since it will bring negative distribution effect and benefit the nations having equipped technology to explore and exploit the ocean (Rüdiger Wolfrum 1983). However, these freedoms are not absolute. States are not permitted to enjoy according to their wish and will. They must maintain due regard for the interests of other States and for the rights of conducting activities in the Area.

### Marine Scientific Research

Adequate and effective Scientific Research is a basic precondition for the rational exploitation of the resources of the sea. MSR helps immensely in preservation of environment, military use of the sea, and exploring the abundance of resources

available (Churchill and Lowe 1999). Part XIII of UNCLOS deals with MSR particularly about mineral and biological resources. MSR is different than any other investigation in the marine environment for the absence of commercial purpose. It is primarily aimed at furthering humankind's knowledge at the marine environment, marine resources, and various phenomena and shall not be used to search for commercial purposes. Article 238 of UNCLOS provides right to all States and competent international organizations to conduct MSR subject to the rights and duties of other States as provided in UNCLOS including rights in the Area and High Seas. Article 256 and 257 of UNLCOS provides for MSR in the Area and in the water column beyond the Exclusive Economic Zone, respectively. MSR under UNCLOS requires to be conducted with certain conditions including information on the nature and objectives of the project; the right for the coastal State to participate in the project and have access to all data and samples derived from the project as well as to assessment and interpretation of such data and results; and making available internationally the research results (Article 248 and 249 of UNCLOS). Article 248 imposes "duty" upon the concerned state to provide information to the coastal state.

## Institutional Mechanisms

### Division for the Ocean Affairs and the Law of the Sea

The division for the ocean affairs and the law of the sea is working under the legal affairs of General Assembly of UN and working as the secretariat of the UNCLOS. The core mandate of this body is "to carry out the responsibilities entrusted to the secretary general of the UN upon the adoption of UNCLOS and fulfill the associated functions" (referred in the General Assembly of the UN and the Bulletin of the Secretary General). Core function encompass providing advice, conducting research, and gathering information on the application of UNCLOS and issues surrounding to the law of the sea; conferring services to the General Assembly and State parties to UNCLOS and agreements under UNCLOS; reviewing developments and reporting the same to the General Assembly, providing services to the Commission on the Limits of Continental Shelf; coordinating among different geographical maritime zones; liaison maintenance with bodies established under UNCLOS; capacity building assistance to the developing countries; maintaining comprehensive information system and voluntary trust fund; and studying state practices in this regard.

### International Seabed Authority

The International Seabed Authority (ISA) is established under the UNCLOS and the Agreement of 1994. The authority is a body through which state parties have to organize all activities concerned with the seabed minerals beyond the territory of national jurisdiction (Churchill and Lowe 1999). It is an autonomous body brought to implement part XI of UNCLOS. The crucial point is that the authority is entrusted to deal with mineral resources only. After taking over the facilities in Jamaica, the ISA became fully operational as an international organization with autonomy in 1996. The authority is served by two bodies, i.e., the Legal and Technical Commission and the Finance Committee (Churchill and Lowe 1999).

### Food and Agriculture Organization (FAO)

FAO is an intergovernmental organization having largest number of member States strives to support improving governance system. It works with governments, IOs, NGOs, and scientific community to improve fisheries management practices. The most pertinent task is to protect vulnerable areas in the high seas and deep sea. Currently, with the support of Norway, FAO facilitates for the implementation of the international guidelines on the management of deep sea fisheries in the high seas. With the support of Japan, it is engaged in fisheries management and marine conservation within a changing ecosystem context deep-sea fisheries component.

### BBNJ Working Group

Efforts have been undertaken by UN since 2004 onwards. UN General Assembly established an

Ad Hoc Open Ended Informal Working Group to study issues pertinent to conservation and sustainable use of marine biological diversity beyond the areas of national jurisdiction (BBNJ Working Group) with the task of identifying possible options and approaches. It met in 2006 and 2008. Since 2010, it has been meeting annually and working with the General Assembly. States are also committed in 2012 in Rio+20 that they will take action on an urgent basis for conservation and sustainable use of marine biodiversity beyond national jurisdiction particularly by taking decision under UNCLOS at the latest in August 2015. BBNJ Working Group agreed in 2013 to recommend General Assembly for this purpose. A proposal is made that within the framework of UNCLOS, a new agreement will be adopted for implementation and management, and facilitating access to MGRs in ABNJ by managing a clear house for data and information related to bioprospecting activities in ABNJ.

### Informal Consultation Process

In 1999, the General Assembly decided to establish the United Nations Open-ended Informal Consultative Process on Oceans and the Law of the Sea (the Consultative Process) in order to facilitate the annual review by the General Assembly, in an effective and constructive manner. The purpose is to focus on the developments in ocean affairs and the law of the sea by considering the report of the Secretary-General on oceans and the law of the sea and by suggesting particular issues to be considered by it. It is emphasized on identifying areas where coordination and cooperation at the intergovernmental and interagency levels should be enhanced (Resolution 54/33).

### Dispute Settlement Bodies

Dispute settlement mechanism is one of the fundamental criteria in order to ensure the objectives settled for the said instrument. UNCLOS is no exception to this. Article 279 of UNCLOS declares that states will settle their dispute by peaceful means as referred to Article 33 of UN Charter. The following article requires that states will have the right to settle any dispute between them by peaceful means of their own choice. This principle will apply to non-state entities such as ISA (Churchill and Lowe 1999).

### International Court of Justice

Article 287 of UNCLOS prescribes for forwarding disputes before the International Court of Justice (ICJ). The ICJ is the principal judicial organ of the United Nations (UN) established in June 1945 under the UN Charter and began to function in April 1946. The primary role of the Court is to settle legal disputes submitted to it by States and also to give advisory opinion referred by authorized United Nations organs and specialized agencies. There are plenty of instances where ICJ has settled disputes relating to delimitation of maritime areas between and among nations. The questions and challenges arising out from the ABNJ can also be brought before the ICJ. However, ICJ has some challenges including the abundance of workload, structural prolonged procedure, and less autonomy of parties (Churchill and Lowe 1999).

### The International Tribunal for the Law of the Sea

The International Tribunal for the Law of the Sea (ITLOS) is an independent judicial body established under UNCLOS for the purpose of adjudicating disputes arising from interpretation and application of the UNCLOS. The Tribunal is composed of 21 members from around the world. Article 21 of the Statute states:

> The jurisdiction of the Tribunal comprises all disputes and all applications submitted to it in accordance with this Convention and all matters specifically provided for in any other agreement which confers jurisdiction on the Tribunal.

State parties will bring dispute before the tribunal. However, it has been provided that the Tribunal shall be open to entities other than State Parties in any case expressly provided for in Part XI or in any case submitted pursuant to any other agreement conferring jurisdiction on the Tribunal which is accepted by all the parties to that case (Article 20 of the ITLOS Statute).

### Arbitral Tribunal

Article 287 (1) (c) refers to the arbitral tribunal formed according to annex VII. Article 2 of Annex VII stipulates about a list of arbitrators which shall be maintained by the Secretary General of UN. State parties are entitled to choose four arbitrators having experience in maritime affairs and enjoying the highest reputation for fairness, competence, and integrity. In cases where the nomination by States is less than four, the parties shall be entitled to propose further nomination.

### Special Arbitral Tribunal

Article 287 (1) (d) mentions about Special Arbitral Tribunal (SAT) to be constituted in accordance with Annex VIII of UNCLOS. Article 1 of Annex VIII provides:

> Subject to Part XV, any party to a dispute concerning the interpretation or application of the articles of this Convention relating to (1) fisheries, (2) protection and preservation of the marine environment, (3) marine scientific research, or (4) navigation, including pollution from vessels and by dumping, may submit the dispute to the special arbitral procedure provided for in this Annex by written notification addressed to the other party or parties to the dispute. The notification shall be accompanied by a statement of the claim and the grounds on which it is based.

There shall be total five members in the SAT consisting two from each side and finally a president. The rules and regulations of SAT will be similar to the arbitration provided in Annex VII.

## Conclusion

The use, utility, and benefit of ocean for human survival are becoming more necessary with the passage of time due to the advancement of science and technology. The ABNJ is the source of innumerable opportunities for the global community as a whole. Therefore, it is significant that this area warrant comprehensive legal regulation so that no individual or group exploits the resources while depriving others from the benefit. The complete solution to the governance of ABNJ is not possible by the existing regime of UNLCOS. The current effort at the UN to adopt the proposed international legally binding instrument (ILBI) is a significant step in this regard. The new instrument would help better in encompassing newly emerged challenges in the area. However, countries must be ready to accept and committed to comply with the measures proposed at UN for the sustainable regulation and governance of ocean area beyond national jurisdiction.

Agency theory; Autonomy; Ghana; Neoliberalism; Regulation/deregulation; State-owned enterprises

## Definition

Governance of state-owned enterprises (SOEs) is a complex and simultaneous act of one the one hand, granting SOEs enough autonomy (to let them manage), while on the other hand, establishing a robust regulatory framework (to make them manage): The objective is to create SOEs that are effective and efficient, yet democratic and accountable.

## Introduction

According to NPM and neoliberalism, deregulation and liberalization are important for letting the managers manage. On the other hand, corruption, poor accountability, and mismanagement of public resources have ushered in a wave of regulations, monitoring, and controls by policymakers in the management of public agencies. This therefore creates a conundrum and raises important questions: How can and should state regulators simultaneously regulate and deregulate to improve performance of public agencies? Using the example of the State Enterprises Commission (SEC) in Ghana, this chapter critically examines the challenges of creating an enabling environment capable of simultaneously letting and making the managers manage in the complex public agency sector. It concludes that if policymakers can devolve enough qualitative and quantitative power to regulatory agencies, then they can create regulatory systems that are effective yet democratic. In the case of Ghana, however, several challenges have rendered the SEC toothless.

## Letting and Making the Managers Manage

Contemporary public sector reform efforts have an ethos to liberalize, introduce greater flexibility, and in the process, reduce the chain and shackle of rules that are accused of stifling innovation and change in public agencies. As such, reform models and efforts like liberalization and privatization which emanate from the stables of the new public management (NPM) have been introduced as agents of reform and change in the management of public agencies to make them more efficient. To produce a withdrawn and minimalist state, therefore, regulation and controls have been conceived and constructed as antithetical to efficiency and effectiveness by these reformists (Harvey 2005). The consensus in neoliberal theory is therefore a conscious attempt to grant more autonomy and managerial and managerial freedom to managers of public agencies so that they can turn inputs into improved and measurable outputs (Harvey 2005).

In developing countries, the Washington Consensus (WC) and the Structural Adjustment Program (SAP) of the 1970s and 1980s were very

instrumental and pushed for the introduction of these policies in the public sector in general and state-owned enterprises (SOEs) in particular. This drive is referred to in this chapter as the "deregulate to improve performance school," and it has become very popular in the management of most SOEs globally.

Despite the prominence of the "deregulate to improve performance school," however, there has been a correspondent increase in state regulatory duties, roles, budgets, and agencies in most public sectors (Levi-Faur 2005; Moran 2001). Thus, there is a corresponding increase in the types, forms, and layers of regulations that have come to be closely associated with public agency reforms (Power 1997). One author refers to this explosion of rules, regulations, monitoring, and controls in the public sector as the audit explosion (Power 1997). Proponents of these arguments claim that it is only effective and proper monitoring, regulation, and controls that can prevent shirking and opportunistic behaviors of managers of SOEs (Power 1997). These renewed efforts of regulation will be referred to in this chapter as the "regulate to improve performance school."

This renewed push for regulation and monitoring therefore raises some important questions that are of concern and interest to this study: How can and should the state simultaneously regulate and deregulate to improve SOE performance? Do regulatory agencies, especially those in developing countries, have the skills, resources, and methodological sophistication to perform their dual roles effectively? Using the State Enterprises Commission (SEC) of Ghana, the main state regulator of SOEs, as an example, this chapter critically examines the challenges inherent in regulating public agencies in the era of NPM and neoliberal reforms within a developing country context. It argues that if policymakers and practitioners can simultaneously balance these demands, then they can create SOEs that are efficient and effective, yet accountable, democratic, and citizen centered. But this dream of reformers will be a mirage if state regulatory agencies like the SEC are not empowered and protected from the pressures of regulatory capture.

## Regulation and Deregulation in the Public Sector: Insights from Agency Theory

Agency theory analyzes the way "a principal in a contractual relationship can design a contractual system to motivate an agent to behave in harmony with the economic interest of the principal" (Wallis et al. 2007, p. 66). Principal agency theory examines how governments, acting on behalf of citizens, can design a contract for the provision and delivery of public services and programs that will motivate managers of SOEs to secure both the economic and political objectives. Furthermore, principal–agent theory is concerned with what motivates entrepreneurial and human behavior especially in a contractual relationship (Christensen and Lægreid 2007). A principal–agent relationship "arises when a principal delegates tasks to a contracted agent whose conduct directly affects the welfare of the principal agent" (Wallis et al. 2007, p. 66). Thus, there is both an implicit and explicit principal–agent relationship between governments (as principals) and managers of SOEs (as agents).

In principal–agent theory, the main reference point between the principal and the agent is the contract governing their relationship. To be effective, the contract, especially explicit contracts, must be clear and specify inputs and outputs as well as remunerations and consequences for meeting or failing to meet performance targets between principals and agents (Hubbard et al. 1999). This attention to detail is important to prevent agents from cheating and committing moral hazards due to information asymmetry inherent in principal–agent relationships (Dollery 2009).

A major criticism of agency theory is that it assumes power in the contractual relationship that is evenly distributed and that it is only the agents that are opportunistic, suspicious, and prone to cheating using information asymmetry (Boston 1991). Another criticism of agency theory is the concept of information asymmetry between principals and agents. Due to the lack of perfect information in the market, information asymmetry "opens the way for agents to exploit principals by engaging in shirking or opportunistic behavior

directly contrary to the interests of principals" (Dollery 2009, p. 37). To address information asymmetry and its attendant problems, agency theory proposes that incentive alignment, monitoring, controls, and regulations should be employed and enforced to keep the agent under control. Herein lies the principal–agency conundrum in SOE reforms and management. For instance, neoliberals and NPM adherents call for the shrinking of the administrative state, reducing its supervisory, regulatory, and monitoring roles to induce superior performance (Shields and Evans 1998). The question, then, is how can such a reduced and limited state adequately monitor, control, and regulate contractual relationships between the principal and agent to prevent shirking and opportunistic behaviors?

This partly accounts for why so many resources have been invested into the regulatory, monitoring, and auditing roles of the government in both developed and developing countries. In short, demands for the regulatory state are probably higher now than ever because of different means of public service production and provision from central agencies to dispersed and decentralized ones. As Power (1997) stipulates, this "disaggregation and devolution of public service provision require the specific technologies of re-aggregation and re-centralization which accounting and auditing (regulation) promises" (p. 44). This is because as public agencies get more structural, legal, and financial autonomy and independence from their parent ministries (most SOEs operate under a sector minister who performs supervisory roles and has final say on policy), power and authority become disperse to frontline service providers. In most cases, however, these power and authority do not come with accompanying accountability measures. Still, in some cases, the methodological sophistication and technology needed for this may be absent or inadequate. The case for increase regulation and monitoring in the SOE sector can therefore be summed up as follows. Due to opportunistic and shirking behaviors of managers of SOEs, increased and improved regulations and monitoring is needed to protect the public interest in the management and operations of these SOEs.

## Core Features of Principal–Agent Theory

From the above, four main characteristics or core features of principal–agent theory can be gleaned. These are an enforceable contract, independence/autonomy between principals and agents, biting teeth for the principal, and finally, resourcefulness (Wallis et al. 2007).

The cornerstone of any principal–agent relationship is not just a contract, but an enforceable contract (Hubbard et al. 1999). There must be an explicit contract that defines tasks, time periods, payment levels, and circumstances under which the contract might be renewed or terminated (Hubbard et al. 1999). Such an explicit contract is important to guide the relationships between principals and agents. The need for enforceability is difficult in implicit contracts, but a necessity in explicit contractual situations is important because of the need to both monitor and measure performance in a principal–agent relation.

The second major feature of agency theory is independence and/or autonomy of the agent and the principal from external influence and control. The concept of agency autonomy is frequently used in the study of public organizations and involves the art and act of devolving discretionary, legal, financial, policy, and structural freedom between principals and agents (Christensen and Lægreid 2007). Such an autonomy or independence is important to prevent undue pressure and influence of that might prevent principals and agents from performing their respective roles. It is also important to enable both parties to perform their duties and keep to their commitments in the contract.

The third feature is that the principal must have biting teeth or "teeth to bite." This means that the principal must have the power to enforce the contract, apply sanctions, withhold payments and promotions, and use other relevant coercive measures to enforce the contract and keep the agent in line. Not only should the principal have these teeth, the principal must be able to use them as and when necessary (Boston 1991; Dollery 2009). Teeth as used here may come in the form of legal mandates, the power to withhold payment and bonuses, sanction errant behavior, and above all use the coercive power of the state at its disposal to keep the principal in line and in check.

The final characteristic is resourcefulness on the part of both principals and agents to perform their roles as per the contract. For the agent, resourcefulness means funding, technology, skills, and time. On the other hand, and for the principal, it means legal backing, political support, dedicated/timely funding, and technological advancement. Political support is a very powerful tool for any state regulatory agency to perform its duties without fear or favor (Table 1).

These core features of agency theory will be used later to evaluate and analyze the activities of the SEC in Ghana. But in the next section, the analysis will shift to the methodological approach used to collect and analyze data for the study.

**Governance of State-Owned Enterprises, Table 1** A framework for analyzing regulatory governance from an agency perspective

| Core feature | Institutional design |
|---|---|
| Enforceable contract | Clearly defined tasks, timelines, and mandates |
| | Managerial accountability |
| Independence/ autonomy | Legal, financial, policy, and managerial freedom/autonomy between principals and agents |
| Biting teeth for the principal | Contract enforcement and apply sanctions |
| | Legal accountability |
| Resourcefulness | Secure funding, skills/expertise, and time |
| | Competitiveness to attract/retain the best skills |

## Methodology

Various qualitative approaches were used to collect and analyze data in the study. The first part of the qualitative approach was the use of semi-structured questionnaires to interview participants. The interviews were conducted at the premises of the participants in Ghana in the summer of 2016. Each questionnaire was made up of open-ended questions. Such questions gave the respondents enough leeway to answer the questions fully while providing enough explanations and clarity. It also allowed for follow-up questions to gain further clarification.

The actual interview process involved directly engaging and talking to respondents to obtain their views about the SOE reform process in general and the role of the SEC as a regulator. About 20 individuals, representing ten public and private organizations and institutions including the SEC, Public Utilities Regulatory Commission, Ministry of Finance, Parliament of Ghana, Association of Ghana Industries, Trades Union Congress, Public Services Commission, Attorney-General's Department, and the Auditor-General's Department, were interviewed.

Two people, made up of senior officers (director to deputy director level) with an average of 5 years' experience, were interviewed in these departments. The selection of participants and organizations for the study and interviews was done by purposive sampling or what is also known as non-probability sampling (Northrop and Arseneault 2008). Compared to probability sampling, this approach granted me more control, freedom, and influence over the choice of organizations and personnel that better suits the needs of the research. Recruitment for the interviews was done by mailing letters to the leadership and senior management of the above organizations, explaining the objective of the study, inviting them to participate in the study, and setting appointments. The letters therefore served as a "snowball sampling" instrument. All the interviews took place at the office premises of the interviewees and were recorded and later transcribed.

## Regulating and Deregulating in the Public Sector: The Debate Continues

This section critically examines the competing dual roles of the "regulate and deregulate to enhance performance" debate in public agency reform.

### Deregulation Is the Problem: The Case for the "Regulate to Improve Performance" School

Power (1997) in an illuminating study makes a perfect case for the institutionalization of audits

and regulations in the public sector. He argues that as governments strive to reform using market-type principles and neoliberal-inspired ideas like privatization, deregulation, contracting, and liberalization, there is an equal commitment to governance through "internal control systems" (p. 42) of organizations aimed at ensuring that governance principles like accountability, transparency, and rule of law are not sacrificed on the altar of value for money considerations. This, according to him, involves attempts to "push control further into the organizational structures, inscribe it within systems which can then be audited or regulated" (Power 1997, p. 43). He argued that these audits and regulations are aimed at providing comfort and assurances for policymakers and citizens that scarce public resources are been used parsimoniously. It is this movement toward further internal controls and system audits that have ushered in the regulatory state in the post-reform period. As such, the performance state has assumed and is actively engaged in a process variously known as the globalization of regulation, the regulatory state, the governing through regulation, and an audit explosion (Power 1997; Levi-Faur 2005; Moran 2001).

Within the discipline of public administration, regulation can be conceptualized as an attempt to temper the value for money objectives (economy, efficiency, effectiveness) of public agencies with their social and political objectives and improving governance in general. Regulations can therefore be conceived as purposive attempts by governments to build trusts and assurances between governments and citizens that scarce public resources are being used judiciously and parsimoniously (Yang and Holzer 2006). Beyond conforming and assurance, therefore, regulations and audits are also aimed at securing or protecting democratic governance values such as public accountability, transparency, and equity/fairness while protecting public agencies from corrupt practices and waste of scarce public resources.

Nevertheless, the emergence of neoliberalism as a dominant economic and political ideology, coupled with the rise of NPM and the reinventing government movements of the 1990s, has questioned the efficacy of regulations and ushered in what is referred to here as the "regulate to improve performance" school.

### Regulation Is the Problem: The Case for the "Deregulate to Improve Performance" School

Letting the managers manage and greater managerial autonomy are the undergirding creeds of the NPM and reinventing government, but its roots can be traced to the concept of neoliberalism and its impact on public sector reforms (Harvey 2005). Neoliberalism has been the dominant theory influencing economic and political thinking and reforms since the 1970s and calls for the shrinking of the state (Shields and Evans 1998). Politically, neoliberalism is a "theory of political economic practices that proposes that human well-being can best be advanced by liberating individual entrepreneurial freedoms and skills within an institutional framework characterised by strong private property rights, free markets, and free trade" (Harvey 2005, p. 2).

Neoliberals abhor numerous regulations, controls, and the proverbial red tape as the main causes of underperformance in the public sector. In many developed and developing countries, neoliberalism came to mean "deregulation, privatization, and withdrawal of the state from many areas of social provisions" (Harvey 2005, p. 3). To create a citizen centered, competitive, and participatory state and public agency, therefore, there is the need to reduce the chain of rules, and shift from an emphasis on inputs, and processes to that of outputs and results. Reformers all over the world have treated this publication and similar ones as a tool kit of reforms and have adopted and in some instances adapted them to restructure their public agencies.

Both the "regulate to enhance performance" and the "deregulate to enhance performance" schools pose a big challenge and anticipated superior performance to governments, especially those in developing countries. This is because these dual responsibilities demand certain skills, funding, technology, and other legal and political mandates that might be present but insufficient or completely absent to governments of these countries.

## The State Enterprises Commission and the Making of the Regulatory State in Ghana

In the colonial and immediate postindependence periods in Ghana, SOEs emerged as unique policy instruments suitable for the command and control economic and political system that was created. The immediate postindependence era witnessed one of the most drastic expansions of SOEs in Ghana and was driven by the ruling party's ideological inclination of pursuing state-led economic development (Killick 2010). Thus, there was a stated political ideology that was anchored on socialism to use SOEs and by implication increase state intervention as engines of growth, development, and industrialization of the new independence state (Hutchful 2002). To navigate these contours, between profits and sociopolitical objectives of SOEs, therefore, it was important that the ownership of SOEs be firmly in the grips of the government so that they can be deployed and employed effectively to achieve their dual and complex objectives.

As early as 1951, the colonial government enacted the Ghana Industrial Development Corporation (GIDC) to, among other things, monitor, regulate, and coordinate industrial policies in government-owned or controlled corporation in the colony (SEC 1997). The GIDC played its role until after independence when in 1964 its mandate and legal framework were changed with the creation of the State Enterprises Commission (SEC). (The State Enterprise Commission is different from the subsequent State Enterprise Commission that was created but their mandates are similar.) Like the GIDC, the SEC was mandated to supervise, coordinate, monitor, and protect government interests in state-owned or joint enterprises where the state had a stake. Its role was therefore confined to the monitoring, supervision, and regulation of SOEs in Ghana (SEC 1995). Unfortunately, it did not have any effective means of enforcement. This limited mandate of the SEC and subsequent inabilities to effectively play its role led to the creation of the Ghana Industrial Holding Company Limited (GIHOC) in 1967 (SEC 1995). GIHOC was mainly used to prosecute the government's import substitution policy agenda and had responsibility over the manufacturing sector which was the mainstay of the economy (SEC 1997).

Growing complexities of the manufacturing sector, underperformance, and the realization that GIHOC was challenged in its capacity and expertise led to the creation of the State Enterprise Commission (SEC) (the State Enterprise Commission (SEC) was the first time SEC was changed from a corporation to a commission to better regulate the SOE sector) in 1981 to replace GIHOC. Like the State Enterprises Commission before it, "the assigned role of the 1981 Commission was essentially advisory and included no direct authority over SOE operation" (SEC 1995, p. 18). But once again, SOEs were not bound by the advice of the SEC and could decide, as most of them did, to disregard the advice of the SEC (SEC 1997).

This lame duck SEC was later transformed into the National Trust Holding Company (NTHC) in 1976 to specifically deal with issues on investment management; underwrite shares, bonds, and securities; and manage stock brokerage (SEC 1997). However, instead of facilitating an enabling institutional framework and environment for SOE governance and performance, these agencies were rather engaged in "overlapping responsibilities and by entrenched practices of ad hoc intervention in operational decision making" of SOEs (SEC 1995, p. 33). Consequently, they succeeded in creating an environment of "an absence in SOE autonomy, an unsatisfactory and ineffective diffusion of accountability for performance and overall, an ineffective system for governing the SOE sector" (SEC 1995, p. 33).

It was to correct these institutional anomalies, constraints, and paralysis while creating an enabling environment for SOE governance and management that the present State Enterprises Commission (SEC) was created in 1987 under PNDC Law 170 (SEC 1997). Under the State Enterprises Commission Law, 1987 (PNDCL 170), the SEC is mandated to present two annual reports to the government. These are the report on the performance of the commission for the

preceding fiscal year and the report on the performance and operations of the SOE sector (SEC 1998). These annual reports usually outline the current state of SOE reforms and their financial performance, performance contracts, and trends.

The SEC is therefore mandated to monitor, supervise, and regulate the corporate governance, financial performance, and internal auditing of SOE management and operations in Ghana. They are also responsible for advising government on the criteria for establishing new SOEs, appointment, and removal of the chief executives and boards of SOEs (SEC 1997). It is therefore fair to state that the failure or success of the SEC sector in Ghana depends to a very large extent on the SEC. The SEC has therefore been clothed with the law and operational authority to create an enabling environment for SOE management and performance and to supervise, regulate, and monitor them to ensure accountability. In NPM parlance, the SEC is responsible for letting and making the managers of SOEs manage effectively and democratically in Ghana.

## A Closer Look at the SEC in Ghana

In this section, the four key features/characteristics of principal–agent theory discussed above will be used to examine and assess the performance and relevance of regulatory the SEC as the regulators of SOEs in Ghana.

The first feature is an enforceable contract to regulate the activities of both the principal (SEC) and the agent (SOEs). Ghandan and Eberhard (2007), using the case of utility management in Tanzania, have written about the challenge of enforcing contracts in the public sector in developing countries. Similarly, Larbi (2001) examined the challenge and difficulty of enforcing performance contracts in the SOE sector in Ghana. Due to organizational amnesia or ineptitude, the SEC is unable to effectively negotiate a performance contract with the SOEs under its contract, and even when it does, it cannot enforce them. The main problem is the lack of expertise in contract law and other critical aspects of contract negotiation and enforcement. For instance, as one respondent lamented:

> When I joined the commission, at consultation all the consultants will be there to contribute to the negotiations because varied expertise and opinions are needed. But this present management will select only one person to go and negotiate. This gives the SOE a numerical strength and negotiation leverage.

Another responded that "in most cases, we lack lawyers and accountants who understand contracts and contract law to analyze and negotiate performance contrasts with clients SOEs". But as Domberger and Rimmer (1994) argue, enforceable contracts involve "the costs of contract design and negotiation as well as the monitoring and enforcement costs" (Domberger and Rimmer 1994, p. 443). The monitoring and enforcement argument is particularly salient in public sector contracting because of "an expectation that contractors will attempt to shade quality unless deterrence is made through intensive and costly monitoring activity" (p. 443). Unfortunately, poor or nonexistent strict enforcement mechanisms mean that the SEC is unable to perform this important duty of protecting the public interest in SOE governance and management.

The second principal–agent characteristic is independence and/or autonomy of the principal or what Moran (2001) describes legitimacy and accountability. This is concerned with autonomy and discretionary powers vested in regulatory agencies and their leaders in a democratic dispensation and raise potential conceptual and theoretical questions for public administration and democratic governance. Liberal democracies thrive on the principles of majority rule, public participation, and in Ghana the separation of powers between the different arms of government serves as check and balances. However, because of the vast powers that regulatory agencies like the SEC have, especially discretionary powers, they can operate virtually above control

from both the executive and parliament even though they are a creation of the system.

As Christensen (1999) explains, autonomy and increased discretionary powers have unintended consequences by making agencies unresponsive, unaccountable, and resistant to change. The potential fear of misuse of discretionally power on the vulnerable in society is also a valid political concern of increased autonomy of regulatory agencies. In the case of the SEC, this poor accountability framework is compounded by the fact that it does not regularly submit its reports to the government and to the parliament. It is therefore difficult for policymakers and by implication, citizens, to hold it accountable since they have little or no information to work with.

Still with regard to the SEC, it neither has an independent source of funding nor does it have any income from uses fees (SEC 1997). As one respondent stated:

> We are under government so the government controls the funding. Everything we do come from government. This means that the independence of our source of funding is a big problem.

The effect is that annual budgetary allocations are not released at all or on time and if they are released at all, they are inadequate. This puts a lot of pressure on the SEC to perform its constitutional duties efficiently. The lack of funding also exposes the SEC to capture by the same SOEs that it is supposed to monitor and regulate. This leaves the SEC overstretched, extended, and incapacitated to effectively perform its numerous and complex functions in a highly competitive SOE sector.

The ability to enforce contracts using sanctions, penalties, and fines, also referred to as teeth to bite, is the third feature of agency theory. Unfortunately, the law establishing the SEC has also rendered it incapacitated and powerless in regulating and monitoring the SOE sector. This is because the SEC can only advice board of directors (BODs) of SOEs but cannot enforce its findings (SEC 1997). Over the years, the SEC's role has been "advisory, limited to corporate planning, performance management, governance and consultancy services to both Government and Prescribed Bodies" (SEC 1997, p. 15). Several reasons could account for this. One could be that policymakers are unwilling to cede power to unelected heads of the SEC, considering that they will be held accountable for lapses and failures. Another could be the distrust of the market by politicians deeply suspicious of a perceived or real close alliance between the SEC and managers of SOEs. Irrespective of the reasons, the lack of enforcement powers has left the SEC weak and incapacitated in the performance of its core duties.

The fourth and final feature is resourcefulness or what Moran (2001) referred to as efficiency and effectiveness to regulate. Unfortunately, the SEC is ill equipped to perform its core regulatory and supervisory duties primarily because it lacks the required expertise and human recourse and low morale due to poor remuneration and incentives and has no functioning for board of directors for over a decade. As one interviewer agonized during the field work:

> There is a problem in the area of the required skills, expertise and knowledge to perform. Currently we are only about 11 consultants. And the majority is in the performance monitoring and evaluation department (PME) which actually does sub-work contracts. So to summarize the staff expertise and skills situation in a word or two, I will say it's very bad.

On this same topic of the lack of personnel, another interviewee stated that:

> When you need to negotiate properly, it's not there. So we are mostly not fully prepared for the negotiations considering the other party's. So currently, I don't think we are doing a very good job of negotiation these performance contracts. Because of that too, the workload becomes higher, leading to inefficiencies.

Remunerations and emoluments are important factors for attracting and retaining more qualified expertise to work in an organization. But in the case of the SEC, their salaries and other benefits are so woeful that it is difficult to both attract and retain quality personnel to perform key roles. As one respondent put it succinctly:

> I will say our remuneration and management is very bad. But I think its management. If management is good, despite the remuneration, things can be improved. Management is not encouraging, they are not motivating, they are actually self-seeking and don't see to the interest of the commission and the staff.

Political support is a critical resource especially for regulatory agencies. But in the case of the SEC, politicians and policymakers have little interest in resourcing it and making it succeed. For instance, a respondent complained that:

> Since I joined this commission in 1997, nobody has appointed a Board of Directors (BOD). So we don't have a BOD. Those directors at the top, they tell us what to do. We have been fighting for a BOD and it is affecting us.

This lack of political support is strange in Ghana because politicians are normally eager to appoint people to BODs when they come to power. That is why patronage appointments have been identified as a major problem in the SOE sector. Apart from the BOD, the SEC also lacks a full-time BOD chairman. As another respondent stated during the interviews:

> The chairman retired four years ago, and we have a new chairman who has retired but has his term extended. But so far, there are no plans to appoint a full-time chairman any time soon.

Under such circumstances, it is hard, if not impossible, for the SEC to perform its mandated roles. That means it is in no position to ensure and enforce standards, assess performance, supervise the operations of SOEs managers, and in the end, create a hospitable environment for SOE reform and performance.

## Conclusion

The study has contributed to the knowledge and understanding of SOE regulatory governance by stressing on numerous legal, institutional, capacity, political, and governance challenges governments in developing countries face when dealing with SOEs that have both commercial and political objectives. It demonstrates that policymakers and practitioners might have good intentions of creating an enabling environment for SOEs, but that creating agencies to both regulate and deregulate SOEs to achieve these stated objectives remains a mirage in most cases due to unwillingness of policymakers to transfer power to regulatory agencies and regulatory capture by private competitors. It also provides important knowledge and insights on agency theory in developing countries and the public agency sector in general. Finally, for governments in developing countries seeking creative ways to simultaneously regulate and deregulate their SOE sectors for national development, Ghana's case provides some useful insights. For instance, establishing the SEC, setting annual performance targets, and giving it managerial and policy freedom are all worth emulating. Furthermore, the long delay in granting independent sources of finance for the SEC, giving it real power in terms of investing in technology, demonstrates the difficulties that governments, especially those in developing countries, face when dealing with regulation and deregulation in the public sector. These are all lessons others can learn from the Ghanaian case. A caveat though is that while they can learn from Ghana's approach, it must be said that one-size-does-not-fit-all and blindly copying what Ghana is doing may be a disaster because of different environment contexts.

## Synonyms

Governance: Control; Administration; Authority; Governing; Government; Management; Regime; Supervision
Jurisdiction: Domain; Territory; Area; Region; Zone; Sector

## Definition

Governance of the National Maritime Jurisdiction: The attainment of governance pertaining to the sovereign maritime domain of a nation-state, contingent on the strategic outcomes to control, secure, develop, and manage its marine territory.
Governance: The holistic effect of legitimate policy outcomes implemented comprehensively through lawful process in the administration of sovereign nation-state affairs.
Jurisdiction: A bordered territorial unit within a nation-state inclusive of airspace, surface, and subsurface dimensions of the domain where governing systems are implemented as processes intentional to attaining the outcome of governance.

## Introduction

Governance is the holistic effect of legitimate policy outcomes implemented comprehensively

through lawful processes in the administration of sovereign nation-state affairs. Implementation effectiveness in achieving declared policy outcomes is the essential factor in distinguishing "governing processes" from the perception that governance is being attained. The legitimacy of governance attained in a country is therefore measurable by policy implementation outcomes and populous perceptions of their efficacy and fairness.

The responsibility to ensure that governance outcomes serve the public interest belongs to the sovereign state, which must remain persistently engaged to perform leadership and steerage as elements of strategic management. The state, through its governmental institutions, performs those functions regardless of the extent to which market and civil society stakeholders may be involved in actionable roles of collaborative governing. Implementation processes of administration and management increasingly involve diverse and complex networks of stakeholders engaged collaboratively in governing actions (Bevir 2012, pp. 1–7). Certain functions however remain the exclusive performance of responsibility of government, by necessity.

The *traditional* governance regimes for the national maritime jurisdiction (NMJ), however, are configured with implementation processes being primarily the responsibilities of the state. The *traditional* governance regime is comprised of conventional institutional structures, deploying resources along narrow lines of effort comprised of only government agencies in expedient action at the operational level. Absent from the *traditional* governance regime is a comprehensive maritime engagement strategy to align implementation processes effectively to desired outcomes. The resulting tendency of *traditional* service delivery is reactive to local issues pressured from stakeholder networks, instead of response being characterized by proactive, comprehensive, systemic, and strategic qualities. The *traditional* leadership has aversion to risk associated with change in governing structures and functions, overlooking design-evolution as opportunity for progressive innovations in capacity development for improving service delivery methods. The *traditional* performance outcomes, consequently, are inefficient and of limited efficacy, compounded insidiously by diminished governance legitimacy as perceived by the populous.

In contrast, a *preferred design* for achieving governance of the NMJ in developing coastal countries is based on strategic outcomes envisaged with consideration to policy-makers aspirations ascending from policy outcomes achieved by effective sustainable implementation. The *preferred design* identifies four strategic outcomes as fundamental to a country attaining governance of the NMJ: they are capacity to control, secure, develop, and manage its sovereign marine territorial waters. The *preferred design* improves the policy posture by viewing the NMJ as a s*ystem of systems* conducive to an integrative framework for organizing the structures and functions of governance capacity (Joyce 2015, pp. 263–273; Bevir 2012, pp. 73–79). A system-of-systems approach is enabling to a comprehensive maritime engagement strategy to focus the capacity of governance modalities with greater efficacy for achieving policy outcomes and facilitates implementation across the boundaries of social, economic, and environmental dimensions (USJFCOM 2006, pp. II-1-5). In addition, the *preferred design* is agile in accommodating the complex composition of state, market, and civil society interests and values at play in the NMJ. And it is conducive to the collaborative engagement of relevant stakeholder networks. Stakeholders motivated by service offer potential for collaborative engagement to improve efficacy and budgetary efficiency of governance outcomes (Emerson and Nabatchi 2015, pp. 20–26).

## National Maritime Jurisdiction: What, Where and Who

The NMJ is a complex system of dynamic processes of social, economic, and environmental dimensions influencing the need for a systemic comprehensive approach to governance. The NMJ system of systems consists of capacity interactions at all scales of policy or performative operation and across boundaries of state, market,

and civil society stakeholders. The following is a general overview description of the NMJ physical and operational characteristics.

### Physical Characteristics

The political geography of the NMJ boundaries is codified by the United Nations Convention on Law of the Sea (UNCLOS). The law provided by UNCLOS enables delineation of the NMJ as sovereign marine territory of the state, including shared borders with adjacent maritime states and the legal standing to negotiate with inland states desiring ocean access. The UNCLOS has been ratified by 164 UN Member States and several more parties in observer status.

The UNCLOS provides for each country to discriminate the territorial boundaries of its NMJ seaward to the limits of its exclusive economic zone (EEZ), and as delimited from the international waters (i.e., *high seas*) beyond the demarcation of sovereign states. UNCLOS also provides a rational methodology for the legal delimitation of NMJ boundaries, measured in nautical miles (nm). The UNCLOS measurement of national maritime territory originates from a country's coastal points designated as baselines, extending seaward until the territory is delimited by the EEZ of the country. In the absence of nearby neighboring maritime states, full extension of boundaries is permitted as follows:

- Territorial sea (12 nm), including internal waters
- Contiguous zone (12–24 nm)
- Exclusive economic zone (200 nm)
- High seas (beyond EEZ)

### Operational Characteristics

The operational characteristics of the NMJ occur within the context of its physical characteristics. They are generalized to consist of: governance scope, policy dimensions, systemic interactions, and capacity priorities. These operational characteristics are foundational to the Governance System Context discussed in the next section of this chapter.

**Governance Scope** of the NMJ consists of national and international components. Drivers affect the Governance System Context and influence domestic and foreign policy pressures. Governance is contingent on the capacity for effective implementation of four fundamental outcomes: to control, secure, develop, and manage the NMJ. Challenges to governance of the NMJ are compounded by its physical characteristics, for example, the total nautical mileage which may exceed the size of the country's terrestrial territory. State leadership and steerage in collaborative participatory arrangements with appropriate market and civil society stakeholder networks willing and able for governance roles is increasingly recognized as an effective form of engagement in the NMJ.

**Policy Processes** of the NMJ are engaged by myriad issues of social, economic, and environmental dimensions. Populations of coastal countries tend to be more acceptant to the assimilating effects of international trade and travel, particularly those segments who are stakeholders in the NMJ. Particularly in developing coastal countries, the resources, capacities, and comparative advantages of the NMJ are more readily recognized as critical to integral development outcomes. So too, these populations are more attuned to the complex dynamic of the marine ecosystem as a source of policy drivers and pressures.

**Systemic Interactions** occur in spatial and functional processes which tend to form patterns by their effects. Specialized capacities interact to inform policy processes for enabling decision advantage which tends to improve the formation, implementation, and evaluation of policy action. These interactions involve networks comprised of state, market, and civil society stakeholders, which increasingly engage collaboratively in activities – as trusted networks operating in mutual interest and purposes – to accomplish goals of common good in the NMJ.

**Capacity Priorities** are focused on comprehensive efforts to attain governance of the NMJ. Capacity is transformed into governance modalities by implementation processes composed of actionable lines of effort. An application of capacity is accomplishment of maritime sustainable development goals specific to the country's NMJ, which are constituent to its governance.

In facilitation of that purpose, the United Nations General Assembly (UNGA) Sustainable Development Goal No. 14, *Conserve & Sustainably Use the Oceans, Seas & Marine Resources for Sustainable Development* and its numerous targets and indicators, is intended to guide implementation by each Member State. Further guidance is provided by UNGA in defining sustainable development as – *development that meets the needs of the present generation without compromising the ability of future generations to meet their own needs*. The UNGA sustainable development goals are focused through social, economic, and environmental dimensions, and their balanced implementation is considered essential to achieving sustainable development.

*Implications for Capacity Priorities* and NMJ operational characteristics generally are intrinsic in the target objectives of UNGA Goal No. 14, which pertain to the following topics:

- Prevent and significantly reduce marine pollution.
- Sustainably manage and protect marine and coastal ecosystems.
- Effectively end overfishing, illegal/unreported/unregulated fishing.
- Implement science-based management plans.
- Conservation of an additional 10% of coastal and marine areas by 2020.
- Increase economic benefits to small island developing states (SIDS) from sustainable use of marine resources and sustainable management.
- Increase scientific knowledge, develop research capacity, and transfer marine technology to enhance the contribution of marine biodiversity to the development of developing countries, in particular SIDS.
- Provide access for small-scale artisanal fishers to marine resources and markets.
- Enhance the conservation and sustainable use of oceans and their resources by implementing international law as reflected in UNCLOS, which provides the legal framework for the conservation and sustainable use of oceans and their resources.

### Typical NMJ Industry Sectors

The physical and operational characteristics of the NMJ provide the venue where governance must be implemented comprehensively and in consideration of the continuous dynamic processes of the country's social, economic, and environmental dimensions. For example, in the economic dimension, the market, i.e., the *ocean business community*, includes industry sectors which benefit directly and indirectly from the strategic outcomes to control, secure, develop, and manage the NMJ. In addition to state roles in governance outcomes, some may be performed by market or civil society stakeholders in collaboration with government agencies. The following are typical NMJ industry sectors comprising a diverse *National Ocean Enterprise* in which the state has prominence in leadership, steerage, or regulation:

- Customs administration and export control
- International trade and commerce facilitation
- Commercial fisheries
- Marine pharmacology
- Tourism trade
- Marine transportation system infrastructure
- Offshore energy
- *National Ocean Enterprise* Education, Training, and Research
- Cross-sectoral synergy – "innovation clusters"
- Regional "Maritime governance cluster"

## Governance System Context

The Governance System Context in which the NMJ must be governed is a complex of dynamic processes that challenge state capacity to control, secure, develop, and manage the NMJ with sufficient efficacy to attain governance legitimacy. This section presents the dynamic processes of the Governance System Context in a simple framework of several factors (Emerson and Nabatchi 2015, pp. 26–30) affecting the NMJ. The factors are listed as follows:

- Drivers
- NMJ characteristics
- NMJ governance regime

- Actions
- Outcomes
- Evaluative adaptations
- Four outcomes fundamental to governance of the NMJ

### Drivers

Drivers affecting the Governance System Context may be geographically global or local in scale, domestic or international, and continuously arriving with the unfolding future to affect conditions in which governance of the NMJ must be implemented. Drivers affect the Governance System Context by their potential for causing or escalating unforeseen challenges to governance by their influence on pressures and trigger events, with strategic implications for national governments. Drivers are transboundary in mobility and occur across the social, economic, and environmental dimensions of a country. Drivers influence change by creating effects such as migration of human culture, innovative adaptations of human systems for self-determination, and ecosystem stress affecting human habitats. Risk is always prevalent in governance endeavors at every level and must be managed by design, rather than by aversion. The critical components of risk are threats, vulnerabilities, consequences, opportunities, and uncertainty.

### NMJ Characteristics

The NMJ characteristics discussed in the preceding section provide insight into the potential implications affecting the Governance System Context. NMJ characteristics are susceptible to unforeseen challenges to governance resulting from seemingly inconsequential trigger events.

### NMJ Governance Regime

The NMJ governance regime is conceptualized as eight essential integral systems which orchestrate as an ensemble of governing capacities, enabling comprehensive maritime engagement strategy for achieving policy outcomes. These *Essential Integral Systems*, introduced by name here, are elaborated in a later section: International Governance Regimes, National Governance, Maritime Domain Awareness, Economic Development, International Engagement, Policy Analysis, Policy Implementation, and Policy Evaluation.

The most fundamental strategic outcomes of the NMJ Governance Regime are to control, secure, develop, and manage the NMJ. Without these outcomes, the attainment of broader policy aspirations and governance of the NMJ itself are not feasible. Policy aspirations envision freedom of capacities and comparative advantages of the NMJ as aggregation from the achievement of policy outcomes. Attaining governance of the NMJ is a subjective perception based on the legitimacy of authority and resilience of implementation processes. Legitimacy therefore is consequential to the combined judgements of state, market, and civil society stakeholders (Margolis 2012, pp. 16–20). The NMJ Governance Regime dynamics include the following constituent subsidiary processes:

- **Capacity Interactions** – collaborative engagement among the *Essential Integral Systems* operating in a continuous cycle of observation, orientation, decision, and action.
- **Informational Sense-Making** – the penultimate plateau of intellectual products enabling decision advantage and a capacity fundamental to each *Essential Integral System*.
- **Change Theory** – an action initiative of policy processes contingent on: enlightened insight; intentionality of will for movement to action; envisioning the action to be implemented; and courage to adapt implementation until policy outcomes are achieved.

### Actions

Actions are outputs of the NMJ Governance Regime processes, enabling advancement from a position of policy oscillation by providing propulsion to desired outcomes. Actions ideally result from proactive policy initiative guided by a change theory. However, it is common for governing authority actions to be reactionary in mode to circumstantial factors which "drive" policy requirements. The reactionary style detracts from the efficacy of actions by causing the trajectory of policy intentionality to stall in oscillation or perhaps even to regress (Fritz 2011, pp. 16–27).

### Outcomes

The trajectory of policy implementation must always move in the direction of outcomes, measured by strategic and operational indications. Outcomes focus the shared motivation of governance modality resources in actionable policy implementation processes directed by proactive design (Fritz 2011, pp. 29–42). The priority of the NMJ Governance Regime capacity is actionable policy implementation which achieves the outcomes to control, secure, develop, and manage the NMJ. Achievement of these policy outcomes is fundamental to accomplishment of NMJ sustainable development goals, realization of aspirational impacts envisioned by policy makers, and the penultimate outcome – attaining governance of the NMJ.

### Evaluative Adaptations

Evaluative adaptations are based on a continuous cycle for systemic measurement of effectiveness and performance among *Essential Integral Systems* of the NMJ Governance Regime. A cycle of observation, orientation, decision, and action (OODA Cycle) enables a continuous operation conducive to collaborative engagement. The OODA Cycle (Osinga 2005, pp. 1–12) should occur among all *Essential Integral Systems* from the policy level to the field. Key to the OODA Cycle is continuous observation of the *current reality* and its comparison to the *desired outcome*, and the identification of discrepancies which may be impeding or obstructing accomplishment of the goal (Fritz 2011, pp. 47–52).

### Four Outcomes Fundamental to Governance of the NMJ

Governance depends on capacity to control, secure, develop, and manage the NMJ. These fundamental outcomes focus the actionable policy implementation of governmental structures and functions deployed as governance modalities. And as appropriate, processes to achieve these outcomes include the collaborative engagement of market and civil society stakeholders.

The outcomes to control and secure the NMJ are implemented as primary roles of State responsibility. The outcomes to develop and manage the NMJ are implemented in shared arrangements of collaboratively engaged state, market, and civil society stakeholders guided by public administration leadership and steerage.

Ethical values enable a framework of risk management practice as the foundation of principled engagement and are catalytic to the efficacy and legitimacy of governance outcomes (Emerson and Nabatchi 2015, pp. 58–60). The practice of ethical values is imperative in all processes to control, secure, develop, and manage the NMJ. Fundamental ethical values include: strategic vision; rule of law; transparency, accountability, integrity, and corruption-countermeasures; effectiveness and efficiency; responsiveness; participatory inclusiveness; collaborative innovation; consensus polity; democracy praxis; power balance; fairness/justice/peace, and legitimate tax policy.

**Control** is the outcome of structures and functions of governance deployed in the NMJ to *establish positive governmental control for enabling governance outcomes in all areas of the national maritime jurisdiction*. The structures and functions of control are comprised of state authority, resilience, and legitimacy that are contingent on implementation through principled engagement adherent to ethical values.

*State level* authority is implemented to control through capacity enabled by the operational agencies of a country's legislative, judicial, and executive branches. Resilience requires capacity for agile service delivery. Legitimacy of governance is the outcome of capacity for consensus approval of authority and resilience perceived by civil society and market stakeholders.

*Institutional level* imperatives of control are: performance, enabled by its capacity for proactive effectiveness; capacity for adaptability in effective mitigation and response; and capacity to create stability as an outcome contingent on the trust and confidence of the populous in the state to achieve declared objectives (UNDP 2011, pp. 270–273, 289).

**Secure** is the outcome of actionable policy implementation to e*stablish a security regime* which enables the sustainable development of integrity and value of the NMJ.

*State level* outcomes are contingent on the capacity to deploy governance modalities in the NMJ for ensuring citizen safety, protection of commerce, and preservation of marine ecosystems.

*Institutional level* outcomes are indicated by effective performance in the implementation of the NMJ security strategy.

The outcome of a secure NMJ may require actionable policy implementations pertaining to: territorial integrity and border security, maritime situational awareness, citizen security and political stability, contraband and ungoverned places of informal markets, illegal nonstate actors and transnational criminal organizations, export controls, and smuggling and revenue loss. Therefore, to secure the NMJ requires capacity for *Maritime Law Enforcement with Integrated Coastguard Functions* at strategic and operational levels.

**Develop** is the outcome of actionable policy to *design and implement a sustainable development plan* for investments in building and developing capacity requisite to accomplish social, economic, and environmental goals of the NMJ. A strategy for this purpose would include desired outcomes resulting from the accomplishment of sustainable economic development goals and measurable indications of improvement in the prosperity of civil society.

*State level* role of government is most appropriate in capacity development of the *basic factors of production* – such as skilled labor, natural resources, research, and infrastructure – and are necessary for NMJ competiveness in any industry sector engaged in domestic or international commerce. Typically, corporations underfund investment in the research factor, and development outputs of research are too market-specific to instigate nationwide innovations. State incentives for basic research and development are therefore instrumental to NMJ capacity development for innovation outputs. The state can steer research investments in the *National Ocean Enterprise* for integral development of potential applications to maritime commerce sectors that are sufficiently diverse to be considered a *public good*, for example, maritime domain awareness.

*Institutional level* roles of government include: *Administrative Development* of the internal capacity (i.e., capabilities in key competencies) of government agencies engaged in the administration of NMJ development projects; and D*evelopment Administration*, which deploys capacity of governance modalities composed of stakeholders from government, ocean business, and civil society communities engaged collaboratively in the field to implement NMJ policy actions and manage the achievement of policy outcomes. In the absence of market competitiveness or relevant ethical values, a responsible resilient government will administrate appropriate regulatory mechanisms to ensure equity and that civil society interests are represented.

**Manage** is the outcome of actionable policy to *establish a management regime* with capacity for sustainable management of the NMJ across its social, economic, and environmental dimensions. A management regime extends from policy implementation and is essential to achieving sustainable policy outcomes. The effectiveness of an NMJ management regime will involve collaborative engagement among government, ocean business, and civil society stakeholders.

*State level* roles of government are leadership and steerage provided through the structures and functions of public administration agencies engaged in the NMJ Governance Regime. This includes engaging the capacity of the NMJ Governance Regime for enabling a comprehensive strategy to include vision, policy, planning, organization, effective implementation, the monitoring and evaluation of outcomes, and a system for instigating adaptive adjustments as may be necessary in order to maintain alignment of strategy execution with envisioned outcomes.

*Institutional level* roles of government also provide leadership and steerage in the form of field operations in the NMJ delivered through the principled engagement of appropriate governance modalities. The agenda of actionable policy implementation is particularly focused on stewardship of marine ecosystems and the living/nonliving resources of the NMJ environment.

The outcome to manage is facilitated by *Marine Spatial Planning* processes, which provide a step-by-step approach toward ecosystem-based management. *Marine Spatial Planning* is

deployable as a line of effort from policy-to-field levels, making it a critical element of strategy for achievement of NMJ Management as a policy outcome. As an International Governance Regimes public resource, the United Nations Educational, Scientific, and Cultural Organization has published a manual to guide countries in the processes of *Marine Spatial Planning*, from the development of a plan to management of its implementation in the field. *Marine Spatial Planning* provides an integral framework for establishing collaborative governance regimes to enable public participation in deliberative decision making processes focused on specific goals constituent to governance of the NMJ.

## NMJ Governance Regime

The complexity of the Governance System Context described above demonstrates the need for the NMJ Governance Regime to be organized in a system-of-systems architecture, with emphasis on enabling action through joint capacity and shared motivation. A system-of-systems approach enables necessary synergy among diverse governance modality performing actionable policy implementation. Integration and guidance of a system-of-systems architecture enables comprehensive maritime engagement strategy designed by the country where it is to be implemented. In this section, the NMJ Governance Regime is abstracted to eight *Essential Integral Systems* of capacity forming an integrative framework focused on achieving the four fundamental policy outcomes: to control, secure, develop, and manage the NMJ.

### Essential Integral Systems of the NMJ Governance Regime

Each *Essential Integral System* of the NMJ Governance Regime is a resource pertaining to a different type of governing capacity for achieving policy outcomes constituent to governance of the NMJ. The capacity of each *Essential Integral System* is transformative to specific types of governance modality (Immordino 2010, pp. 127–142) fundamental to control, secure, develop, and manage the NMJ as strategic outcomes fundamental to its governance. The eight *Essential Integral Systems* are introduced above in the section on Governance System Context and will be elaborated in subsequent sections of this chapter and are again listed below.

- International Governance Regimes
- National Governance
- Maritime Domain Awareness
- Economic Development
- International Engagement
- Policy Analysis
- Policy Implementation
- Policy Evaluation

The eight *Essential Integral Systems* are conceptualized as an ensemble, providing decision makers a multispectral lens for enhanced visibility of integral capacity resources of the NMJ Governance Regime available to perform critical functions. This view facilitates improved performance of state and institutional leadership practice in the decision making processes for policy, implementation, and evaluation that is transformative to flexible and innovative methods of service delivery. Orchestrated as an ensemble, the eight *Essential Integral Systems* enable correlated performance in resilient adaptive configurations of form purposed to functional efficacy, with potentially mitigating effects on instability agents engaged in the NMJ operational arenas.

The strategic outputs of each *Essential Integral System* are information and performance and vary in proportions of primary or secondary depending on the functional priorities of a particular system. They are thus integral and essential equally to both policy decision-makers and to operational policy-implementers. This concept of the eight *Essential Integral Systems* as resources of capacity both *Informative and Performative* to policy is depicted below in Table 1.

### Essential Integral Systems: Roles in Policy Action

This subsection charts the capacity interactions of the eight *Essential Integral Systems* arranged by functional relationship with the strategic outcomes to control, secure, develop, and manage

**Governance of the National Maritime Jurisdiction in Developing Coastal Countries, Table 1** Essential Integral Systems of the NMJ Governance Regime

| Policy Customers: Decision-Makers and Operational Implementers | |
|---|---|
| *Primary capacity* | *Primary capacity* |
| *Informative to policy*<br>International Governance Regimes<br>National Governance<br>Maritime Domain Awareness<br>Economic Development | *Performative to policy*<br>Policy Analysis<br>Policy Implementation<br>International Engagement<br>Policy Evaluation |

the NMJ. The chart abstractly portrays the entire NMJ Governance Regime capacity as a dynamic system of systems, persistently engaged – directly and indirectly – in processes deploying actionable lines of effort to control, secure, develop, and manage the NMJ. The chart further identifies the *Essential Integral Systems* in roles as either direct-action systems or indirect-action systems, listed descending to those most remote from the field of operational implementation.

Control

*Direct-Action Systems*:

- International Engagement (lead operational implementer)
- Maritime Domain Awareness
- National Governance
- Policy Analysis
- Policy Implementation
- Policy Evaluation

*Indirect-Action Systems*:

- Economic Development
- International Governance Regimes

Secure

*Direct-Action Systems*:

- International Engagement (lead operational implementer)
- Maritime Domain Awareness
- National Governance

*Indirect-Action Systems*:

- Policy Analysis
- Policy Implementation
- Policy Evaluation
- Economic Development
- International Governance Regimes

Develop

*Direct-Action Systems*:

- International Engagement (joint-lead operational implementer)
- Economic Development (joint-lead operational implementer)
- Maritime Domain Awareness
- Policy Analysis
- Policy Implementation
- Policy Evaluation

*Indirect-Action Systems*:

- National Governance
- International Governance Regimes

Manage

*Direct-Action Systems*:

- International Engagement (joint-lead operational implementer)
- Policy Evaluation (joint-lead operational implementer)
- Maritime Domain Awareness
- Economic Development

*Indirect-Action Systems*:

- Policy Analysis
- Policy Implementation
- National Governance
- International Governance Regimes

## Capacity Applied Integrally in an Ascending Pathway

The efficacy of policy outcomes achieved is most sustainable when policy implementation processes of the NMJ Governance Regime are orchestrated integrally, systemically, and

strategically. A planning method facilitates that purpose based on a conceptualization of sequential echelons of *capacity applied integrally in an ascending pathway*. They function in successive interdependence as six Echelons of Capacity, each enabling the more compound echelon in an ascending sequence, applied throughout the NMJ Governance Regime.

**Six Echelons of Capacity** as a sequential process commences with Decision Advantage and culminates with Governance of the NMJ Attained. This concept theorizes intrinsic synergy in the structure of the NMJ Governance Regime conducive to the alignment of strategy. Applied as planning method within each *Essential Integral System*, the six Echelons of Capacity form a rational pathway for designing effective sustainable implementation processes. The six Echelons of Capacity are listed below in ascending hierarchy, followed by elaboration.

1. *Governance of the NMJ Attained*
2. *Aspirational Impacts Realized*
3. *Policy Outcomes Achieved*
4. *Actionable Policy Implementation*
5. *Governance Modality*
6. *Decision Advantage*

*Governance of the NMJ Attained* is the pinnacle outcome perceived from the NMJ Governance Regime successes in policy outcomes achieved and aspirational impacts realized.

*Aspirational Impacts Realized* are state desired outcomes envisioned by policy makers, as a product of *strategic vision*. When attained they create governance value-added attributes beneficial to state, market, and civil society stakeholders. They represent the holistic effect and synergy of accumulated successful policy outcomes achieved.

There are two aspects of aspirational impacts realized – *Freedom of Capacity* and *Comparative Advantage* – which pertain to each *Essential Integral System* and to the NMJ Governance Regime overall as a system of systems. Their rationale is illustrated by the hypothetical converse, whereas inadequate capacity constrains the freedom to achieve policy outcomes; similarly, failure to achieve policy outcomes would result in comparative "disadvantages." Determined by their measurability, *Freedom of Capacity* is the more objective and *Comparative Advantage* the more subjective. In applying this concept, the following are nominal examples of these two aspects of *Aspirational Impacts Realized* designated for the NMJ Governance Regime as a system of *Essential Integral Systems*:

- Freedom of Capacity for Governance of the National Maritime Jurisdiction
- Comparative Advantage of Achieving Maritime Sustainable Development Goals

*Policy Outcomes Achieved* Is capacity resulting from the ways and means of *Actionable Policy Implementation* that aggregates to enable capacity for *Aspirational Impacts Realized*.

*Actionable Policy Implementation* Is the capacity to transform policy-makers intent to execute performative action through governance modality, planned and organized into ways and means of implementation. For example, the *Essential Integral System* for International Engagement provides the NMJ Governance Regime the primary ways and means to focus lines of effort for achieving *Actionable Policy Implementation*.

*Governance Modality* Is capacity transformed by implementation processes, composed of actionable lines of effort, into deployable performative ways and means. The paramount purpose of performative capacity is to control, secure, develop, and manage the NMJ.

*Decision Advantage* Is the capacity instrumental to all ascending echelons of capacity in the NMJ Governance Regime. The capacity for decision advantage is enabled by developing information confidence, knowledge, understanding, and sense-making.

### Summary of Aspirational Impacts Realized

The following are hypothetical but nominal statements of "State desired outcomes envisioned by policy makers," i.e., *Aspirational Impacts Realized*, for each *Essential Integral System* (EIS) and the entire NMJ Governance

Regime (repeated from above). Each statement expresses a comprehensive integration of EIS outcomes. These examples serve to guide developing coastal countries in crafting their own *Freedom of Capacity* and *Comparative Advantage* statements.

**NMJ Governance Regime**

- Freedom of Capacity for Governance of the National Maritime Jurisdiction
- Comparative Advantage of Achieving Maritime Sustainable Development Goals

**EIS for International Governance Regimes**

- Freedom of Capacity for International Consensus
- Comparative Advantage of Cooperative Governance

**EIS for National Governance**

- Freedom of Capacity for Governance Legitimacy
- Comparative Advantage of National Equilibrium

**EIS for International Engagement**

- Freedom of Capacity for Performative Governance
- Comparative Advantage of Operational Implementation Efficacy

**EIS for Economic Development**

- Freedom of Capacity for Integral Development
- Comparative Advantage of Maritime Sustainable Development

**EIS for Maritime Domain Awareness**

- Freedom of Capacity for Science-based Governance
- Comparative Advantage of Information Confidence

**EIS for Policy Analysis**

- Freedom of Capacity for National Vision
- Comparative Advantage of Proactive Policy Options

**EIS for Policy Implementation**

- Freedom of Capacity for Goals Accomplishment
- Comparative Advantage of Policy Synergy

**EIS for Policy Evaluation**

- Freedom of Capacity for Agile Governance
- Comparative Advantage of Policy Efficacy

## Each Essential Integral System: Elaborated

This section provides a practical perspective to each *Essential Integral System* (EIS) as governance modality and "capacity applied integrally in an ascending pathway" toward attaining Governance of the National Maritime Jurisdiction. A brief description of each EIS and its capacity interactions adds to understanding their roles in the NMJ Governance Regime.

### EIS for International Governance Regimes

The *Essential Integral System for International Governance Regimes* provides capacity which is *informative to policy* vis-a-vis numerous documentary instruments produced by international intergovernmental organizations. These informative documents comprise a comprehensive scope of topics applicable to the NMJ of coastal countries, in addition to the high seas of international waters. The *International Governance Regimes* system is an informative reference resource of regulatory frameworks, guidelines, and best practices. The *International Governance Regimes* system is readily available to the capacity interactions of the NMJ Governance Regime. The value enables decision advantage by government ministries and agencies of countries engaged in developing, implementing, and evaluating foreign policy for maritime affairs and relations vis-à-vis their own national maritime jurisdictions.

Marine fisheries management is an exemplary application of *International Governance Regimes* system capacity that includes many topical subdivisions such as the issue of participation in decision making by fishers and other persons with an interest in fishing. The United Nations Food and Agriculture Organization *Code of Conduct for Responsible Fisheries* guides coastal countries in the development of information, knowledge, understanding, and sense-making on fisheries issues that enable their policy makers with actionable decision advantage.

The rule of law framework provided by UNCLOS provides guidance enabling coastal countries to engage in effective diplomacy vis-à-vis matters of the marine environment and

shared natural resources. In particular, a common dilemma is the transboundary movement of migratory fisheries across the political boundaries. Adjacent national maritime jurisdictions are often habitats to migratory fisheries that do not abide human lines of demarcation. Instead, remediation is intrinsic in the collaborative engagement of affected states to establish bilateral and multilateral cooperative arrangements. The practice of successful diplomacy has included agreements involving shared responsibilities in satisfying mutually recognized obligations.

### EIS for National Governance

The *Essential Integral System for National Governance* provides capacity which is *informative to policy* vis-à-vis its advisory guidance in all endeavors of state pertaining to governance of the NMJ. This resource is continuously relevant in all cycles of policy processes and in the other *EIS*. The capacity interactions of the *National Governance* system guide the State structures and functions on a pathway of legitimacy enabled by the practice of principled engagement throughout the NMJ Governance Regime.

The capacity of the *National Governance* system provides important leadership to the NMJ Governance Regime based on three subsystems of "governance qualities" that function as criteria for measurable indicators (UNDP 2011, pp. 278–283). They are state level – authority, resilience, and legitimacy; institutional level – performance, adaptability, and stability (UNDP 2011, pp. 271–273, 289); and a set of ethical values guiding principled engagement that are to be practiced pervasively at all levels.

**State level indicators** are:

- Authority – capacity to implement state roles in society and all national territory.
- Resilience – capacity for agile service delivery to civil society and market constituencies.
- Legitimacy – capacity for consensus of authority and resilience.

**Institutional level indicators** are:

- Performance – capacity for proactive efficacy in service delivery; a measure of authority.
- Adaptability – capacity for mitigation and response effectiveness; a measure of resilience.
- Stability – capacity for trust and confidence of the populous in the state to achieve declared objectives; a measure of legitimacy.

**Ethical Values indicators** enable a framework of systemic risk management practice as the foundation of principled engagement at state and institutional levels throughout the NMJ Governance Regime. They are catalytic to the efficacy and legitimacy of governance outcomes. Fundamental ethical values include:

- Strategic Vision
- Rule of Law
- Transparency, Accountability, Integrity, and Corruption-countermeasures
- Effectiveness & Efficiency
- Responsiveness
- Participatory Inclusiveness
- Collaborative Innovation
- Consensus Polity
- Democracy Praxis
- Power Balance
- Fairness/Justice/Peace
- Legitimate Tax Policy

### EIS for Maritime Domain Awareness

The *Essential Integral System for Maritime Domain Awareness* provides capacity which is *informative to policy* vis-à-vis its advisory guidance in all endeavors of the state pertaining to governance of the NMJ and to market and civil society stakeholders as may be appropriate. The capacity of the *Maritime Domain Awareness* system is fundamental to control, secure, develop, and manage the NMJ. Actionable policy implementation, for example, relies on the *Maritime Domain Awareness* system in deployment of tactical afloat units.

The capacity interactions of the *Maritime Domain Awareness* system provide policy makers with evidenced-based decision advantage developed through the systemic processes of information confidence, knowledge, understanding, and sense-making pertaining to the social, economic, and environmental dimensions of the NMJ. The spatial extent of the NMJ consists of its legal

specifications delimited by UNCLOS inclusive of sovereign surface, subsurface, seabed, airspace, internal marine waters, and relevant shoreline areas.

**Spatial Data Infrastructure** is a component of *Maritime Domain Awareness* system capacity to inform policy that is compiled at multiple scales by systematically surveying the geospatial attributes of the NMJ. These compilation and analysis requirements are enabled by computerized geographic information system technology. The interdisciplinary methods of geography guide this process to compile necessary information based on five thematic categories:

- Location
- Place
- Human-environment interactions
- Movement
- Region

**Maritime Situational Awareness** is an outcome of the *Maritime Domain Awareness* system that supports the strategic interests of actionable policy implementation and the field-level execution of operations through governance modality. This outcome requires the capacity of an *ocean surveillance information system* (OSIS) capable of detection and monitoring functions. An OSIS provided of coordinated operational decision-making structures and functions enable actionable responsiveness. Additionally, the supporting processes of information fusion, analysis, and reporting dissemination are critical to efficacy of outcomes intended to serve strategic, operational, and tactical requirements.

**Lost Foreign Trade Revenue and Informal Commerce** can be minimized by the *Maritime Domain Awareness* system. For example, evasion of customs regulations violates national law and renders even legal goods to be declared contraband and subject to seizure by the customs administration. The national treasury loses customs revenue and badly needed foreign trade income also from undocumented voyages and cargoes. Consequences for the country's economy include erosion of commercial trade-capacity development, and emergent ungoverned places harboring informal markets in contraband trade. These conditions instigate vulnerabilities to criminal exploitation and the potential disenfranchisement of affected places and populations. Their detection and monitoring are imperative.

### EIS for Economic Development

The *Essential Integral System for Economic Development* provides capacity which is *informative to policy* vis-à-vis its advisory guidance in all endeavors of the state pertaining to governance of the NMJ and to market and civil society stakeholders as may be appropriate. The *Economic Development* system is also *performative to policy* vis-à-vis its joint-lead role with the *International Engagement* system as operational implementer to develop the NMJ.

The capacity interactions of the *Economic Development* system enable the convergence of the political processes of the state and the economic processes of the market to engage collaboratively in the implementation of investment outcomes and integral development beneficial to their mutual interests and to civil society. Instrumental to the efficacy and sustainability of the other EIS capacities and comparative advantages are the policy outcomes achieved by the *Economic Development* system. The importance of NMJ economic development capacity for developing coastal countries is significant and amplified for *small island developing states*.

A fundamental role of the state in economic development capacity is to provide a legal and regulatory environment enabling fairness and justice among market competitors and civil society laborers/consumers. Balance among state, civil society, and market stakeholders engaged in sustainable development across social, economic, and environmental dimensions is intrinsic to efficacy of the *Economic Development* system. Requisite legislated structures and functions include a regulatory regime for ensuring property rights and contracts based on rule of law principles, procedures, and judicial process. The rule of law outcomes can be facilitated by leveraging the socio-economic effects of raising living standards of individual citizens and advancing the aggregate progress of civil society (UNDP 2011, pp. 281–285).

The *National Ocean Enterprise*, previously explained in the subsection on typical NMJ industry sectors, provides intrinsic capacity for potential cross-sectoral integral development and comparative advantage of the NMJ. A distinguishing role of the market is the provision of employment for the nongovernmental labor segments of civil society. The market stakeholders of the ocean business community engage in this process, endeavoring to achieve individual enterprise competitiveness while also striving to be relevant in the economic development and comparative advantage of the NMJ. The collaborative engagement of the ocean business community, civil society, and government agencies as stakeholders of mutual interest facilitates their understanding of the market forces impacting the competitiveness of *National Ocean Enterprise* industries.

**The Cross-Dimensional Characteristics of the NMJ Governance Regime** occur as social, economic, and environmental issues that focus priorities on the accomplishment of sustainable development goals as constituent to policy outcomes achieved. The coordination of the *Economic Development* system across industry sectors improves the efficacy of actionable policy implementation and policy outcomes achieved by the NMJ Governance Regime.

Cross-dimensional characteristics, vis-à-vis the *Economic Development* system, provide a range of investment goals which necessarily involve collaborative engagement among diverse stakeholder networks to achieve complex outcomes. They illustrate the necessity for subsidiary system capacity in *marine spatial planning* to enable requisite implementation processes. Nominal examples of investments are presented below in brevity:

- *Social Dimension Priorities* near-term civil society goals; long-term development of sustainable capacity to raise living standards.
- *Economic Dimension Priorities* near-term increase in *National Ocean Enterprise* productivity; long-term sustainable development of capacity for increased international competitiveness.
- *Environmental Dimension Priorities* near-term marine ecosystem risk mitigation, protection, and development of its capacity for goods/services productivity (e.g., fisheries subsistence/commerce); medium-term remedial actions enabling stabilized/restored processes; long-term development of resilience capacity.

### EIS for International Engagement

The *Essential Integral System for International Engagement* provides capacity which is both *informative and performative to policy* in all endeavors of state pertaining to governance of the NMJ. The capacity interactions of the *International Engagement* system form a coherent framework of Governance Modality for directing processes to control, secure, develop, and manage the NMJ. It serves as the lead operational implementer for that purpose. Pertaining to develop the NMJ, the *International Engagement* system shares the lead role jointly with the *Economic Development* system. To manage the NMJ, the *International Engagement* system shares the lead role jointly with the *Policy Evaluation* system. Further, the *International Engagement* system is conceptualized as a capacity compatible to partnering with other coastal countries, enabling performative functions in maritime affairs of foreign relations such as cooperative engagement or international assistance.

The *International Engagement* system is the *performative* nexus of NMJ Governance Regime ways and means by focusing lines of effort to achieve Actionable Policy Implementation in the field and those of policy-level processes for the alignment of strategy and operations. Therefore, the *International Engagement* system is the key enabler of Policy Outcomes Achieved for all EIS (USJFCOM 2006, pp. IV-1-2). Indicative of its *informative* role, the *International Engagement* system supports the *Maritime Domain Awareness* system through the operational presence of deployed personnel in the field.

The capacity for *Maritime Law Enforcement with Integrated Coastguard Functions* (MLE-ICF), for example, is of crucial importance to the operational efficacy of the NMJ Governance

Regime to control, secure, develop, and manage the NMJ. The *International Engagement* system capacity as a Governance Modality is enabled by MLE-ICF, comprising lines of effort for "waterways management" operational outcomes including marine environmental protection; response operations; boarding and arrest; marine safety/inspection/licensing processes; search and rescue operations; systems of aids to navigation; and maritime, port, and harbor security.

### EIS for Policy Analysis

The *Essential Integral System for Policy Analysis* provides capacity which is both *informative and performative to policy* in all endeavors of state pertaining to governance of the NMJ. The *Policy Analysis* system consists of diverse activities which support actors in their policy development-team efforts. The *Policy Analysis* system emphasizes the explicit orientation of policy to action and intervention. It is intentional to achievement of future desired outcomes, envisioned policy goals, and strategic objectives (Thissen and Walker 2013, pp. 3–5, 157–167).

Paramount focus of the *Policy Analysis* system is on Actionable Policy Implementation and Policy Outcomes Achieved, engaging a comprehensive scope of capacity interactions in its processes. These outcomes are the pathway to Aspirational Impacts Realized and the ascent ultimately to Governance of the NMJ Attained. These reasons empower the *Policy Analysis* system as epicenter of state leadership and steerage in the NMJ Governance Regime. However, effectiveness of the *Policy Analysis* system is enhanced by method adherent to the following principles (USJFCOM 2006, pp. vii–ix; I–4):

- *Visualizing the Operating Context* – the NMJ, as an interconnected system-of-systems consisting of collaborative stakeholders, adversaries, and unaligned interests.
- *Harmonizing and Synchronizing* – courses of action across the full spectrum of Governance System Context and NMJ Governance Regime in applying EIS capacity particularly at policy, strategy, and operations levels; synchronizing ways and means in the process.
- *Appreciating Strategic and Operational Effects* – as integral outcomes (desired and undesired), separated spatially and temporally in the NMJ from their causative actions.
- *Assessing System Behaviors and Capabilities* – emphasizes attaining strategic and operational effects, rather than mere task accomplishment.
- *Collaborating More Extensively* – engaging superiors, subordinates, the interagency community, multinational partners, commercial industry, and civil society stakeholders.
- *Establishing a Definitive Baseline* – in applying an effects-based approach, the discrepancy between *current-reality* versus *desired outcomes* is a latent source of motivation for policy trajectory to advance in the direction of Policy Outcomes Achieved (Fritz 2011, pp. 47–52).

The *Policy Analysis* system capacity is accommodating to policy makers in their aspirational intent of envisioning national goals and desired ends, and their design of Actionable Policy Implementation intended to enable Policy Outcomes Achieved. Support to policy makers begins with the resources for their Decision Advantage. Support is augmented by methods accommodating to policy-makers innovation that enable inclusion of their own intuition, experience, and judgment into the processes of the *Policy Analysis* system.

### EIS for Policy Implementation

The *Essential Integral System for Policy Implementation* provides capacity which is both *informative and performative to policy* in all endeavors of state pertaining to governance of the NMJ. The *Policy Implementation* system processes are a proactive and foresighted variant of the postaction processes of the *Policy Evaluation* system. The *Policy Implementation* system engages in diverse capacity interactions to develop Decision Advantage for transforming the outputs of the *Policy Analysis* system into feasible Actionable Policy Implementation.

*Policy Implementation* system methods include relational studies of existing policies and policy proposals to estimate the potential effects of implementation. Scenarios can be modeled and

simulated to estimate potential outcomes before policy initiatives are approved and authorized for delivery in the field. The intervention to study opportunities, options, and decision choices in advance of deployment enables the application of risk management practice to improve the effectiveness of outcomes.

A highly collaborative interagency planning process increases the repertoire of capabilities available to be integrated into contingency planning or a crisis situation. In a collaborative NMJ Governance Regime, outputs of policy makers are understood to be proposed desired outcomes, i.e., *aspirational initiatives* until validated as feasible through rigorous processes engaged by the *Policy Implementation* system.

The practice of feasibility validation includes development of a change theory, one of the subsidiary processes dynamic throughout the NMJ Governance Regime that is particularly prominent in the *Policy Implementation* system. As an element of the orientation function of the OODA Cycle, a change theory frames the rationale for optional courses of action and guides contingency planning as a risk management practice. The proposed goals, objectives, ways, and means are examined in relation to the desired outcome. The intent is to improve the design of implementation processes for increasing the probability of policy-outcome success. Methods may involve investigation using local-level surveys and participant observation.

The *Policy Implementation* system capacity occurs ideally as an intervention prior to Actionable Policy Implementation is made operational through field-deployed Governance Modality by the *International Engagement* system. This advantages a proposed policy with an advisory reach-back cycle in which any confirmed faults are remanded with sense-making justifications for adaptations intended to improve the feasibility of Policy Outcomes Achieved.

**Planning Processes** are crucial to the initiative of the decision-making team creating successful outcomes by increasing the probability for effective actionable policy implementation. In planning complex endeavors for the NMJ Governance Regime, an effects-based approach (EBA) provides decision makers a wider range of options and potentially more integral capacity to deploy in the operating environment. An EBA increases precision and rigor in the planning, decision making, and coordination of integral courses of action before and during operations. In addition, EBA facilitates subsequent evaluation of outcomes by improving the structural coherence of planning design (USJFCOM 2006, pp. III-1-5).

The forward-thinking processes of the *Policy Implementation* system are coordinated with those of the *Policy Evaluation* system for testing prototype assessment tools and their indicators as metrics of effectiveness and performance in terms of measurability-to-manageability. These capacity interactions enable the *Policy Implementation* system to improve the effectiveness of Actionable Policy Implementation and Policy Outcomes Achieved, and they also improve the functions of the *Policy Evaluation* system.

### EIS for Policy Evaluation

The *Essential Integral System for Policy Evaluation* provides capacity which is both *informative and performative to policy* in all endeavors of state pertaining to governance of the NMJ. The *Policy Evaluation* system engages diverse processes of capacity interactions for measuring the effectiveness and performance throughout the NMJ Governance Regime. However, the echelon priority of the *Policy Evaluation* system is Policy Outcomes Achieved, seconded by its enabling echelon Actionable Policy Implementation (Immordino 2010, pp. 181–189). Among control, secure, develop, and manage as the four outcomes fundamental to governance of the NMJ, the *Policy Evaluation* system is joint-lead operational implementer for the outcome to manage, a role it shares with the *International Engagement* system.

**Assessment of Outcomes** is the paramount capacity of the *Policy Evaluation* system and is guided by principles of managerial accounting to detect and monitor activity-based control metrics. Timely assessment processes must operate systemically in a continuous cycle of observation, orientation, decision, and action (OODA Cycle) enabled by collaborative engagement throughout

the capacity interactions of the NMJ Governance Regime. The OODA Cycle is elaborated below:

- *Observation* processes are the crux of the *Policy Evaluation* system, obtaining information pertaining to the new *current reality*; the OODA Cycle begins and ends with observation.
- *Orientation* processes are informative to policy and enable managerial adaptations to feedback; new *current reality* is compared to policy-makers *desired outcomes* for discrepancies obstructing accomplishment of the goal (Fritz 2011, pp. 47–52).
- *Decision* processes are the outcome of observation and orientation, enabling managerial adaptations intentional to improve the effectiveness of subsequent iterations of Actionable Policy Implementation, and thereby also the efficacy of Policy Outcomes Achieved.
- *Action* processes are the performative transformation of the observation, orientation, and decision processes. Guided by the ethical values of principled engagement, decision makers so informed are more likely to *do the right things for the right reasons*.

The OODA Cycle (Osinga 2005, p. 270) should include an engagement loop of timely feedback among the capacity interactions of each *EIS*, from policy to field levels, for systemic monitoring of progress. The systemic awareness developed from proactive internal assessment processes of the OODA Cycle enables development of resilience and adaptability in each *EIS* and the NMJ Governance Regime as a system of systems.

## Conclusions

The **Introduction** presented an interpretation of governance as the holistic outcome of effective governing implementation outcomes sufficiently effective to persuade perceptions of consensus by the populous. The *preferred design* features of an NMJ Governance Regime were outlined in contrast to the hallmarks of traditional governing approach. The *preferred design* was presented to conceptualize the NMJ as a system of systems, conducive to an integrative framework of structures and functions of governance orchestrated in comprehensive maritime engagement strategy, and instrumental to implementing effective outcomes. The *preferred design* noted potential value in assimilating relevant stakeholder networks into implementation processes, including improved effectiveness and budgetary efficiencies (Bevir; Joyce; USJFCOM; Emerson and Nabatchi).

The section on **National Maritime Jurisdiction Characteristics** provided insights to the complex dynamic Physical and Operational challenges confronting developing coastal countries in their efforts to attain governance of the NMJ. Although UNCLOS brings a framework of legal order to the NMJ, the operational characteristics of governance scope, policy processes, systemic interactions, and capacity priorities combine to emphasize the requirement for a comprehensive and systematic approach to governance of the NMJ.

The section on **Governance System Context** presented a composite of internal and external factors impacting or influencing the NMJ that include the Governance Regime itself. The NMJ Governance Regime is introduced as eight *EIS* orchestrated as an ensemble that enable comprehensive maritime engagement strategy for achieving policy outcomes. The subsection on four outcomes fundamental to Governance of the NMJ explains that governance of the NMJ depends fundamentally on capacity to control, secure, develop, and manage the NMJ. These four fundamental outcomes create a systemic focus for applying the structures and functions of actionable policy implementation processes intentional to attaining governance of the NMJ (Emerson and Nabatchi; Margolis; Fritz; Osinga; UNDP).

The section on the **NMJ Governance Regime** abstracted the governing structures and functions to an integrative framework of eight *EIS* of capacity for actionable policy implementation processes. The EIS are presented as a system of systems orchestrated as an ensemble for achieving the four policy outcomes – to control, secure, develop, and manage the NMJ as fundamental to

its governance. This abstraction enables the systemic capacities for ways and means to be separated and generalized from specific applications and facilitates understanding the resilient adaptability of the ensemble to compound and complex problems (Immordino). This integrative framework for a NMJ Governance Regime facilitates design of comprehensive maritime engagement strategy by developing coastal countries, tailored to their specific requirements.

Further in the section on the NMJ Governance Regime, the subsection on EIS roles in policy action charts capacity interactions of each system as relational processes to control, secure, develop, and manage the NMJ. The subsection on capacity applied integrally in an ascending pathway theorizes intrinsic synergy in the structure of the NMJ Governance Regime conducive to the alignment of strategy that is instrumental to Policy Outcomes Achieved, Aspirational Impacts Realized, and Governance of the National Maritime Jurisdiction Attained.

Finally, the section on **Each Essential Integral System – Elaborated** provides perspective to each *EIS* of the NMJ Governance Regime and their capacity interactions, exampled by practical applications. The functions of each EIS are presented, both as a distinct capacity resource of Governance Modality and in context of its role in enabling the NMJ Governance Regime to operate as a system of systems (UNDP; USJFCOM; Thissen and Walker; Fritz; Immordino; Osinga).

### Utility for Developing Coastal Countries

The *preferred design* for Governance of the National Maritime Jurisdiction (NMJ) presented in this chapter is encompassed in the label of *comprehensive maritime engagement strategy* (CMES). The NMJ Governance Regime structure as a system of systems featuring an ensemble of *essential integral systems* enables CMES to focus capacity development and implementation processes on the strategic priorities for governance of the NMJ. The fundamental priorities are to control, secure, develop, and manage the NMJ.

A systematic approach is essential to the planning and policy making processes of mobilizing, coordinating, and calibrating means and resources integral to effective implementation that create desired outcomes for attaining governance of the NMJ. CMES integrates systems and aligns their capacity interactions in actionable policy implementation processes, enabled by the planning method of capacity applied integrally in an ascending pathway.

CMES utilizes concepts of operation and doctrine for enabling ingestion of interdisciplinary methodologies, tools, and techniques in agile arrangements to create synergy and holistic effects. These basic elements of CMES enable the deployment of common tools and interoperable techniques, synchronized and utilized in persistent engagement throughout the NMJ.

CMES is adaptable at national or regional scales, utilizing implementation methods intended to be cost-effective and sustainable, and designed with systemic measures of effectiveness and performance operating in a cyclical process of continuous evaluation. The generic framework presented in this chapter provides guidance to any developing coastal country interested in designing a *country-specific CMES* to improve the governance of its own NMJ.

### Introduction

Pollitt (2005) has – somewhat ironically – argued that there are certain "hardy perennials" of contemporary public policy and public management. According to our reading, these "hardy perennials" include conceptual entities such as bureaucracy, network, decentralization, power, and governance. The last one of these, governance – profoundly anchored in the New Public Management and New Public Governance doctrines – has virtually been an unassailable concept in the management and public policy sciences for decades now. Governance definitely has a kind of pivotal place in recent public management and public policy discourses. Governance has a long conceptual history, to include multifaceted meanings and to act as counterpart of (often unspoken) alternative for "public sector management" and "public sector leadership." Governance has gained popularity in management sciences and in academic public policy discourse because of its multivalency – its ability to link up with many other arguments and theoretical concepts.

Although interest for the concept governance has increased tremendously during the last two decades, the term is not new, but rather as old as the civilization or the human history (Farazmand 2013, p. 349). As a concept, governance incorporates with the very long history of governing, rule, authority structures, and domination (Tiihonen 2004). Currently, it not only occupies the central stage of development discourse but it is also considered as the fundamental component to be incorporated in the development policy of both developed and developing nations (Hye 2000). Despite its growing importance to the researchers, development practitioners, policy makers, and international aid agencies, governance is far from a "finished product." Rather it is a dynamic concept and worth examining analytically and systematically (Farazmand 2012, p. 351). Pierre and Peters (2000, p. 7) have claimed that the term governance is notoriously slippery, and for good reason. Schneider (2004, p. 25) then has put forward the idea that the conceptual vagueness of the term "governance" is actually the "secret of its success." Farazmand (2012) highlighted governance from three faces, for example, the good, the bad, and the ugly, and concluded that none of these offers a full-scale and comprehensive perspective of the concept. Similarly, Kohler-Koch and Rittberger (2006) have argued that despite decades of huge efforts there is still confusion about the conceptualization of the concept.

The last decades have brought about tremendous changes in global politics and the emergence of service space, constituting of various institutions from public, private, and the third sector (e.g., Virtanen et al. 2016). Moreover, the rise of third sector organizations in developing countries, the changing role of the international aid agencies towards the aid receiving countries, and the significance of people's participation in development projects and action enforce to retheorize the role of public administration. Similarly, excessive political influence and bureaucratic control over central and local governance have been blamed for conditions of massive poverty, corruption, economic stagnation, political instability, confused priorities,

chaos, and violation of human rights of citizens and noncitizens alike (Jreisat 2004). It is also evident that the wealth or poverty of any nation goes hand in hand with the state of governance and not merely with, e.g., the natural resources (Werlin 2003). On the other hand, it is clear that the ground realities or country specific contextual realities play vital role in order to theorizing governance, which has always been overlooked.

As a result, despite its colossal recognition and importance, a universal or acceptable theory of governance has not yet been emerged. Debates prevail and conceptual differences exist in respect of its theoretical formulations, policy prescription, and conceptualization across the world (Hye 2000). Adding "good" with governance has paid much attention to the international aid agencies since 1990s. Good governance becomes an official aid agenda for the aid recipient countries of Africa and Asia. In fact, it has become a common phenomenon in the literature of international aid agencies as a precondition for aid receiving countries (Rhodes 1997). The truism is that good governance is a condition rather than creating better democracy of the developing nations. As a result, a common consensus about its theoretical framework does not exist yet.

Terms, theory and model need clarification here, however. With theory, we refer to Giere (1998, p. 415), who argues that theories are generalized theoretical hypothesis. Notable in this definition is that justifying a theory is actually about justifying a theoretical hypothesis or a set of hypothesis. Models, then, in our semantic and analytical dictionary refers to a kind of conceptual and partly theoretical frameworks, which helps to understand conceptually the topic under scrutiny. Popper (1963) calls this as a discovery of axiomatic systems, a model that consists of a set of things, relations, operations, or functions.

This entry intends to discuss the different theories and models of governance and its conceptual framework in the light of both developed and developing nations through interpreting and reinterpreting the contemporary management and public policy literature. This entry has three sections. First, we take an analytical look into the definitional image and theoretical framework of the concept of governance. Secondly, we discuss the dimensions of theories related to governance. Thirdly, we present our conclusions and discuss our findings.

## Theoretical Framework for Governance

Numerous scholars have come up with definitions concerning the concept of governance. The unified interpretation seems to be, despite the multiple perspectives of the definitions, that as a term, governance refers to the political field and political activity as the vital task of every national government. At the outset, however, we would like to emphasize that the terms government and governance are not same. That is, government and governance are not synonymous terms, although both share goals-oriented objectives. Government occurs when those with legally and formally derived authority and policing power execute and implement activities; by contrast, governance refers to the creation, execution, and implementation of activities backed by the shared goals of citizens and organizations, who may or may not have formal authority or policing power (Rosenau 1992 in Bingham et al. 2005, p. 548). According to Richards and Smith (2002), government is bureaucracy, legislation, financial control, regulation, and force. Governance, on the other hand, refers more like to a growing use of non-regulatory policy instrument. This policy instrument aspect focuses the attention towards proposed, designed, and implemented cooperation by nonstate actors working together with state actors (Jordan et al. 2003).

As a whole, governance is a growing phenomenon. The literature on governance is definitely considerable and expanding (Aminuzzaman 2010, p. 19). Back in history, in the fourteenth century for instance, the term governance referred to an action, method, or function of governing (Halfani et al. 1994). For Landell et al. (1991), governance denotes how people are ruled, how the affairs of the states are administered and regulated, as well as a nation's system of politics, and how this functions in relation to public administration and law. According to Graham et al. (2003),

governance is seen as interaction among structures, processes, and traditions that determine how power and responsibilities are exercised, how decisions are taken, and how citizens and other stakeholders have their say. Therefore, governance is about power, relationship, and accountability: it addresses the questions like who has the influence, who makes the decisions, and how decision-makers are held accountable.

Halfani and his colleagues (1994) highlight governance as a system of government concentrating on effective and accountable institutions, democratic principles and electoral process, representation and responsible structures of government in order to ensure an open and legitimate relationship between the civil society and the state. They emphasized on the relationship between the civil society and the state, which is very crucial. This is in fact and an important notion since this differentiates the study of governance from the study of government. The nature of the relationship between the civil society and the state is the most important feature in their definition. They believe that credibility and legitimating of government can be achieved effectively and efficiently through decentralization and sharing, people's participation, accountability, transparency, and responsiveness. In the same way, Organization for Economic Co-operation and Development's (OECD) (1995) definition of governance includes public administration and the institutions, methods and instruments of governing and also incorporates relationship between government and citizen (including business and other citizen groupings) and the role of the state. In order to cope with the challenges of the twenty-first century, to understand the relationship in-between the state and non-state agencies is thus important. This is because of the economic globalization, massive corruption of state agencies, failure of centrally planned economy, elitist bureaucracy, remarkable breakthrough of information technology, and the rising role of the third sector, popularly known as the Non-governmental Organizations (NGOs) across the developing world (e.g., Hossain 2001; Salomon and Anheier 1996; Anheier and Seibel 1990).

Interpreting and reinterpreting the contemporary public management and public policy research literature, we have pinpointed two different approaches. According to our analytical rereading of the existing literature, these two approaches derive their origins from (1) international aid agencies and (2) European scholars. Both approaches seem to have constituted the conceptual framework for governance from their own perspectives.

As an example from the first conceptual dimension, we take the World Bank (1994) as an example. The World Bank defines governance as the manner in which power is exercised in the management of a country's economic and social resources for development. In fact, in its definition, World Bank highlights the administrative aspects of governance, which emphasizes the following major issues: civil service reform, public sector downsizing, service delivery, contracting out public interventions, as well as institutional capacity building. Furthermore, the World Bank affiliated researchers address governance from three perspectives (e.g., Kaufmann et al. 2000). They are: the process, by which governments are selected, held accountable, monitored, and replaced; the capacity of the governments to manage resources efficiently and formulate and implement and enforce sound policies and regulations; and the scope of people's participation in the affairs of the state and access to the administration.

Secondly, as an example from the second conceptual dimension, Kooiman (1993) defines governance as the forms in which public or private sectors engage in problem solving, not separately, but in conjunction with other actors in society. This approach, therefore, views governance as forms of multiorganizational action rather than involving only state institutions. In fact, these kinds of definitions have redefined the role of the state and distinguished governance from the traditional public administration and this is the intellectual and conceptual starting point for the emergence of the New Public Governance, breakthrough public sector management paradigm since the beginning of the millennium. In the same vein, March and Olsen (1995) presented a framework for democratic governance from a new-institutional perspective of political science.

Their perspective is that the enhancement of democracy improves political governance. The task demands developing: democratic identities; capabilities for appropriate political action among citizens, groups, and institutions; accounts of political events; and an adaptive political system, which copes with changing demands and environment.

Hyden (1992) has widened discourse of governance on the level of theoretical generality. To him governance concerns mostly the rules of the game of political rule. Governance, according to him, is a conscious management of regime structures with a view to enhancing the legitimacy of the public realm. He pays attention to the political legitimacy of governance contrary to economists, who give emphasize economic factors and efficiency. Hyden's views are further elaborated by Bratton and Rotchild (1992) into the following five interpretations:

- Governance is a conceptual approach that frames a comparative analysis of macropolitics.
- Governance concerns big questions of a "constitutional" nature that establish the rules of political conducts.
- Governance involves creative intervention of political actors to change structures.
- Governance emphasizes interaction between state and social actors.
- Governance refers to a particular type of relationships among political actors, that is, those which are socially sanctioned rather than arbitrary.

Rosenau and Czempiel (1992) discussed governance in a very comprehensive manner. According to Rosenau (1992), governance is a more encompassing phenomenon than government. It includes non-governmental institutions and informal, non-governmental mechanisms and how they move ahead, satisfy their needs, and fulfill their wants. He emphasized that governance is a process whereby an organization or society steers itself. It includes many channels through which commands flow in the form of goals framed, directives issued, and policies pursued. It is a process where communication is central (Rosenau 1995). In addition, for him global governance is a sum of myriad – literally millions of – control mechanisms driven by different histories, goals, structures, and processes. Rhodes (2001) found different interpretations for governance though his interpretation is not so faraway than others. He used governance as: (1) a minimal state; (2) a corporate governance; (3) a new public management; (4) good governance; (5) a sociocybernetic system, and (6) self-organizing network. The key concern of all these are the role of the state, not only in political field but in all policy sectors as well.

To summarize, we can say that the concept of governance applies to multiple forms of collective action. However, it is about more strategic aspects of steering of a society: the larger decisions about direction and roles. That is, governance is not only about *where to go* but also about *who should be involved in deciding* and in what capacity. Therefore, we found four areas or zones where the concept is particularly relevant.

- ***Governance in "global space," or global governance***, deals with issues outside the purview of individual governments.
- ***Governance in "national space***," i.e., within a country: this is sometimes understood as the exclusive preserve of government, of which there may be several levels: national, provincial or state, indigenous, urban or local. However, govern*ance* is concerned with how other actors, such as civil society organizations, may play a role in taking decisions on matters of public concern.
- ***Organizational governance*** (governance in "organization space"): this comprises the activities of organizations that are usually accountable to a board of directors. Some will be privately owned and operated, e.g., business corporations. Others may be publicly owned, e.g., hospitals, schools, government corporations, etc.
- ***Service space governance*** reflecting the idea of governing local, regional, and national service spaces, consisting of various service providers from private, public, and the third sector.

- ***Community governance*** (governance in "community space"): this includes activities at a local level where the organizing body may not assume a legal form and where there may not be a formally constituted governing board.

Based on our analysis, we feel that the concept of governance is often referred for more rhetorical rather than substantive reasons. In early 1990s, governance appears to be used in place of government as if government was a difficult word to sell in a privatized, market-oriented society. Governance is about a reinvented form of government, which is better managed (e.g., Osborne and Gaebler 1992). In this perspective, governance is about the potential for contracting, franchising, and new forms of regulation. Hood (1991) refers to this kind of governance as the New Public Management (NPM), and this kind of thinking also applies in the domain of New Public Governance.

We think governance is a lucrative concept, since it contains a promise to bring public administration and public services – and politics for that matter – "closer to the citizens." The other side of this coin is accountability. Governance incorporated with decentralization of political authority make politicians and top management at public administration more visible and thus more accountable (Bourgon 2011). Governance thus links with the concept of accountability and thus sheds light to the accountability processes at public service systems level and especially to the trajectories, differences, and anomalies of vertical and horizontal accountability dimensions (e.g., Schillemans 2011).

From the above discussion, it is clear that all definitions are closely related and mutually reinforcing. Despite narrow differences in its meanings, the proponents of governance emphasize three important issues. These are decentralization, a people-oriented governance system, and enhancement of people's participation through networking governance. Therefore, it can be said that as a system, governance is rarely static and it should be politically neutral, locally reliable, and contextually acceptable. The outcomes of governance cannot be assessed by its theoretical aspects and romantic assumptions only. As Ahrens (2002, cited in Jreisat 2004 and Archibugi et al. 1998) points out, there is no evidence that either democratic or nondemocratic states are better suited to initiate and consolidate policy reforms effectively and to promote sustained economic development. The outcomes of governance in any country have to be considered by its results. Good performance is inescapably related to satisfaction of criteria such as the participation of people in decisions affecting them, the capacity to aggregate and coordinate various interests in order to bring about consensus on policies, and managing of institutions and regime structures with efficiency, accountability, and transparency (Jreisat 2004).

In this entry, we have measured the term governance based on the above statement. In addition, from a broader perspective, it is considered as a continuous process of the state: a participatory form of governance whose existence and effectiveness depend on how it perceives the needs and demands of the locality, promoting people's participation in the decision-making process and decentralizing power to the local institutions. The above is comparatively true because the main concern of public administration is the cooperative group behavior of different actors of the state (Simon et al. 1974).

The term "governance" has been topped with extra ingredient in the research discourse of development in developing countries by having the term "good" added to it. "Good Governance" entered the vocabulary of development administration and international development cooperation in the 1990s. Therefore, it is important to discuss the term, since it has become an important policy agenda of international aid agencies across the developing world.

## A Normative Dimension of Governance: What Makes Governance Good?

In this section, we ask what makes governance good. This question is highly appropriate since the term "good governance" has apparently become a strongly desired value (Zafarullah and Huque 2001), driving force of the time (Farazmand 2012) and an obsession of current development debates in

both developed and developing countries (Williams and Young 1994 cited from Jamil 1998a). It has become a common phenomenon in the literature of international aid agencies as a precondition for aid recipients during the last three decades (Rhodes 1997). An overview of the research literature provides various interpretations of the term.

As a concept, "good governance" does not have a straightforward definition, though it has been expanding rapidly in the discourse of development (Vartola et al. 2010). In general, good governance is associated with efficient and effective administration in a democratic framework. It is equivalent to purposive and development-oriented administration, which is committed to improving the quality of life of the people and enlarging the scope of people's participation in the decision-making process of development. In short, it is a citizen-friendly, citizen-caring, responsive, decentralized local government system; an autonomous political society; an efficient and accountable bureaucracy; strong civil society; and a free media (Huque 2001; Minocha 1998; Stowe 1992). Coproduction of services in-between public service providers and service users has been quite often noted as a relevant newcomer, as an ingredient in the making of good governance (e.g., Tuurnas 2016).

Conceptually speaking, according to the Human Development Report of 2002, there is no single answer to the question of what is good governance. However, the factors that make institutions and rules more effective, such as transparency, participation, responsiveness, accountability, and the rule of law, may be regarded as the characteristics of good governance. The world leading aid institutions such as the World Bank (1994, 1997), UNDP (1997, 2002), and the OECD (1995) have become the great proponents and frequent users of this concept, especially for the aid receiving countries, to promote democracy, decentralization, accountability, transparency, rule of law, and people's participation in their development.

The World Bank (1997), for instance, from its lending experience in many developing countries, has realized that good governance is central in creating and sustaining an environment, which fosters strong and equitable development and its essential complements to sound economic policies. The World Bank has also identified a number of aspects of good governance, such as political accountability, freedom of association and participation, rule of law and independence of the judiciary, bureaucratic accountability, freedom of information, a sound administrative system, partnership between the government and the civil society organizations, and the like (e.g., Blunt 1995). These aspects have been considered as preconditions in ensuring good governance in aid receiving countries. The OECD uses the World Bank's views of good governance and defines it similarly.

The UNDP's apprehension of good governance is more or less similar to that of the World Bank. According to the UNDP (1997), good governance means equal participation of all citizens in decision-making. It is transparent, accountable, and equitable, and it promotes the rule of law. It allows the local people and the most affected to be heard when decisions are being made and when resources are handed out. In fact, unlike other aid agencies, the UNDP emphasizes more on identifying the basic characteristics of good governance. These characteristics include participation, power decentralization, rule of law, transparency, responsiveness, consensus orientation, equity, effectiveness and efficiency, accountability, strategic vision, and so on.

Although the UNDP has given the above characteristics of good governance, it believes and recommends that the societies should determine which of the core characteristics are important to them, considering their contemporary (both internal and external) socioeconomic and political situations. The UNDP (2002) further argues that good governance advances sustainable development for three reasons. Firstly, enjoying political freedom and participating in the decisions that shape one's life are fundamental human rights. Secondly, it helps to protect people from economic and political catastrophes. And finally, because it can promote sustainable development by empowering citizens to influence policies that promote growth and prosperity and reflect their priorities (see, e.g., Hope 2005).

It needs to be pointed out from the above discussion that the notion of good governance is still

developing in terms of its definition, its ethical connotations, and its usefulness (Kruiter 1996). In addition, critics suggest that the theory of good governance is often used as a tool – just as human rights and democracy – to gain advantage politically rather than to genuinely help the people. Farazmand (2013, p. 355) identified the deficiencies of the concept of good governance from two perspectives. For example, firstly, interaction of only three forces or elements are considered to constitute good governance – the interaction among the state, civil society, and the private sector. But the governance in developing countries is more influenced by global and regional forces rather than domestic forces. Secondly, the term "good governance" is heavily loaded by normative values – what is good and what is bad and for whom? – as defined by global power politics. As a result, in order to meet and manage the challenges of globalization, Farazmand (2013, p. 350) proposes the concept of "sound governance" in the place of "good governance."According to him (2013, p. 356) sound governance means more than the term government and governing and good governance. Sound governance includes the state as an enabling institution, the constitutional framework, the civil society, the private sector, the engaged citizens, and the international/global institutional structure within limits. He further argues that it is "inclusive and promotes participation and interaction in an increasingly complex, diverse, and dynamic national and international environment (ibid)."

Therefore, the meaning of good governance cannot be confined in a timeframe. Cultural heritage, traditional values, environmental realities, political culture, and economic structure have to be taken into account in defining and determining characteristics of good governance (Asaduzzaman 2011).

## The Plethora of Governance Theories and Models

We think it is evident that the term "governance" is still far from mature in the domain of public administration. During the last three decades, it has been under growing debate as a theory and practice among the scholars, practitioners, and especially within the framework of international aid agencies, and this is because of the concept's dynamic, culture-bound, and time-related nature. We have also found out – echoing Jessop's (1995) argumentation – that the academic literature on governance is very diverse and incoherent. As a result, its theoretical roots are various such as institutional economics, international relations, organizational studies, development studies, political science, public administration, and Foucauldian-inspired theorists. In this section, we highlight the conceptual insights with regard to governance as a "model" from four perspectives – that of Stoker (1998), Mintzberg (1996), Peters (2001), and Heady (2001).

Analyzing and criticizing the role of traditional public administration, Stoker (1998) discussed the theory of governance under five broad propositions, which are complementary rather than contradictory. These five propositions are:

1. Governance refers to a set of institutions and actors that occupy government bodies and "beyond" – that is, they are also from the private and the third sector.
2. Governance identifies the blurring of boundaries and responsibilities for tackling social and economic issues.
3. Governance identifies the power dependence involved in the relationships between institutions involved in collective actions.
4. Governance is about autonomous self-governing networks of actors.
5. Governance recognizes the capacity to get things done which does not rest within the power of government to command or use its authority.

Stoker (ibid.) further argues that each proposition has associated with it a certain dilemma or critical issues. They are:

1. There is a disparity between the complex reality of decision-making associated with governance and the normative codes used to explain and justify government.

2. The blurring of responsibilities can lead to blame the avoidance or scapegoating.
3. Power dependence exacerbates the problem of unintended consequences for government.
4. The emergence of self-governing networks raises difficulties over accountability.
5. Even where government operates in a flexible way to steer collective action, governance failure may occur.

These propositions provide a broader canvas to the changing world of government and emphasize on power decentralization, as well as on local self-government and involvement of all sectors in the governance process.

Henry Mintzberg, one of the leading management scholars of the last century, has asked a very appropriate question. If we acknowledge the "blurry" conceptual starting point of "governance," then we might ask, in order to shed light to this conceptual confusion by asking, how should governance be managed and led? In order to give answer to this question, Mintzberg (1996, pp. 80–82) critically discusses five models. They are as follows: the government-as-machine model, the government-as-network model, the performance-control model, the virtual-government model, and finally the normative-control model.

1. ***The government-as-machine model*:** According to this model, government is viewed as a machine dominated by rules, regulations, and standards of all kinds. Although this model gained popularity earlier in this century, it lacked flexibility and responsiveness to individual initiatives.
2. ***The government-as-network model*:** This model is contrary from the earlier one. This model suggests government as an intertwined system, a complex network of temporary relationships fashioned to work out problems as they arise and linked by informal channels of communication. It intends to connect, communicate, and collaborate. However, this model is also holographic in that the parts function like the whole: Individual projects function within a web of interrelated projects.
3. ***The performance-control model*:** According to this model government is more like business. This model assumes that the overall organization consists of business units, which are assigned performance targets for which their managers are held accountable. On the other hand, performance model decentralizes in order to centralize; it loosens up in order to tighten up. This comes at the expense of flexibility, creativity, and individual initiative.
4. ***The virtual-government model*:** in order to overcome the limitations of machine model and provide better services to the people, virtual government model intends to privatize, contract, and negotiate. According to this model, the microstructures would no longer exist within government rather all that kind of work would take place in the private sector.
5. ***The normative-control model*:** Compared to other models, this model is more values and norms oriented rather than structure and systems. This model has five important elements such as: (1) *Selection*: people are chosen by values and attitudes rather than just credentials; (2) S*ocialization*: this element ensures a membership dedicated to an integrated social system; (3) *Guidance*: guidance is by accepted principles rather than by imposed plans, by visions rather than by targets; (4) *Responsibility*: all members share responsibility. They feel trusted and supported by leaders who practice a craft style of management that is rooted in experience; and (5) *Judgment*: performance is judged by experienced people, including recipients of the service, some of whom sit on representative oversight boards.

Our third "governance model" example is provided by Peters (2001), who has presented four renowned models of governance in his scholarly book, *The Future of Governing*. These models are:

1. ***The market model*,** according to which the private sector can provide better services than the traditional public sector.
2. ***The participatory state model*,** which is different from the market model as it puts more

emphasis on greater individual and collective participation by segments of government organizations that have been commonly excluded from decision-making.

3. ***The flexible government model***, according to which the government should be contextual and flexible. In order to face environmental challenges and changes, and to meet the people's demands, appropriate and suitable policies should be made by the government.
4. ***The deregulated government model***, which focuses on less bureaucratic control, more managerial freedom, and recommendation based on societal needs and collective decision-making.

Peters' models of governance have paved the way for viewing governance from broader perspectives. For instance, Farazmand (2012, p. 227) has claimed that although each Peters' model has significant structural, managerial, policy making, and public interest implications distinct from others, it overlaps on many features.

Finally, we turn to Heady (2001), who recognizes – as a leading theorist of comparative public administration – three theories of governance. Heady's approach is rather different than that of Stroker, Mintzberg, and Peters, because Heady focuses more on theories which help to understand "governance" as a phenomenon rather than building a typology – as Stoker, Minzberg, and Peters have done – of variations of power structures and institutional settings that embody governance policies and actions. Heady (ibid.) underlines the usefulness of three theoretical approaches which are deployable when assessing the role and nature of governance. They are as follows:

1. ***Organizational theory*:** this is a finely ordered system of superordination and subordination, in which higher offices supervise lower ones. In fact, this theory grounds heavily on the Max Weber's concept of rationality and bureaucracy. During the twentieth century, organizational theory evolved and multiplied to the extent that from the current perspective the notion of one single organizational theory would be a huge oversimplification.
2. ***Cultural theory*:** this theory is associated with the Rigg's theory of Prismatic Society. According to Heady, Rigg's theory of Prismatic Society is the most notable single contribution in comparative public administration. Cultural theory is a particularly prominent approach to scrutinize semifeudalistic system of government. This theory is also influenced by the work of Parsons (1951), who described a "traditional way of life" as including ethnocentricity; primordial rather than functional associations; the sanctification of customs, beliefs, and practices; the discouragement of individualism; an emphasis on authority by birth rather than merit; customary rather than contractual relations; supematuralism; the unwillingness to accept personal responsibility for development; and social rather than legal sanctions. "Until people (particularly leaders) can escape a traditional way of life, they cannot substantially improve governance and living conditions" (in Werlin 2003, p. 331).
3. ***Structural-functional theory*:** this theory argues that the success of political systems in maintaining political support depends on political structures' capacity to perform various functions, including interest articulation, interest aggregation, rule making, rule application, rule adjudication, and communication.

Assessing and criticizing Heady's perspective on governance, Werlin (2003) highlights governance from a different viewpoint and proposes his own theory, which is known as the "political elasticity theory of governance." According to Werlin, this theory attempts not only to reduce the confusion and tension of public administration but also to link comparative administration to comparative politics and development studies (Werlin 2003). He emphasized governance as an integrated system between the soft form and the hard form of political power and decentralization of power by various methods that affect the behavior of wider circles of citizens, participants, and subordinates.

We understand from the above that the theories of governance have been prescribed by the

various academics and aid agencies from various perspectives. Therefore, it is difficult to find a single ideal model of governance for all seasons, applicable to all nations and communities across the world (Farazmand 2013, p. 361). It is important to keep in mind that the condition of any development model may remain unrealized given the social economic, political, and cultural complexities of a particular society. The main challenges which arise from both the academic and aid agencies' models of governance is applicability in the cases of developing countries, where socioeconomic and political features are complex (Haque 2011, p. 62). Farazmand (2013, p. 361) highlights that "local regional and cultural distinctiveness demands application of governance models that are suitable to local conditions." For example, South Asia has a long colonial history and its administration has therefore been heavily influenced by the colonial rule. As a result, the administrative and political systems of South Asia are incompatible with its indigenous social, economic, political, and cultural contexts (Vartola et al. 2010, p. 7, Haque 1996).

## Conclusion

The dynamic nature of society is one of the reasons why the concept of "governance" has remained blurry. If the context is constantly evolving and radically changing – global economy, institutional changes, military status quo, global trade agreements, societal values, and so on – no wonder if the theories and models of governance constantly shape their contents. For instance, the complexity of society has evolved as a huge topic within management, political, and social sciences (to name only few branches of science) but very little is actually known what actually constitutes this complexity, how public policies deal with the complexity issue, and how does the domain of governance fit into this picture. We feel that the problem of existing public policy evaluation paradigms and program evaluation models in particular is that they do not fit in with the current societal challenges, the emergent nexus problems, and the explicated models and theories for governance. Therefore, it is easy to foresee that the academic as well as the practical discussion around the concept of governance will continue as a polyphonic exercise.

However, despite interpretational and contextual differences, the above discussed theories and models of governance are closely related, as they focus on a more people-oriented, integrated, and decentralized local governance system as well as global-level managing of networks. However, it is quite difficult to judge which theory would guarantee:

- Development and sustainable development
- Poverty eradication
- Reducing/combating corruption
- Promotion of people's participation in development
- Decentralization and innovative/democratic local governance
- Democratic governance or good governance

According to White and Killick (2001), there is no accepted theory of poverty that establishes a hierarchy of causes, nor is there any widely adopted model that might serve the same purpose (cited from Werlin 2003). Jamil Jreisat (2004, p. 1006) more precisely states that for any national governance system to succeed in an increasingly interconnected, rapidly changing world, it needs to develop a governance system based on a learning and decision-making process, in order to be able to grow and adapt to citizens' expectations, as well as to operate effectively across shifting boundaries. He further argues that in fostering reform activities, public institutions must rely on their own internal learning process, while adapting to international standards and practices (Jreisat 2004, p. 1006). Farazmand (2002) very succinctly expresses this idea as "thinking globally and acting locally."

Research implications of this study are thus various. They are listed in detail as follows:

- The built-in flexibility and agility of the "governance concept" taking into account (a) political-cultural hierarchies in-between policy regimes and systems as well as (b) vertically

disperse governance and management levels of public administration at local, regional, national, and transnational levels
- The role of governance "applications" at different levels of government taking place at various organizational settings and public service spaces taking into account the role of combining theoretical, conceptual, and empirical research agendas
- The leadership paradigms and power structure hierarchies vis-á-vis network-based institutional settings within the domain of governance as well as the resilience of governance policies in the current era of complex nexus problems and severe systemic governance challenges (such as the Internet of Things, technology, digitalization, and robotics) (Virtanen and Kaivo-oja 2015).

# Governance, Brazil

Fernando Filgueiras
National School of Public Administration, Brasília, Brazil
Department of Political Science, Federal University of Minas Gerais, Belo Horizonte, Brazil

## Synonyms

Authority; Institutions; State structure

## Definition

Governance is an institutional process of building political and administrative authority, defining who governs, under what conditions and with the duty of accountability to society.

## Introduction

The institutional building of governance in Brazil stems from a complex historical process of construction of the state and a set of reforms that were carried out throughout the twentieth century and the beginning of the twenty-first century. This trajectory of institutional building was posed as the confrontation of patrimonialism and the rupture with the colonial past, elevating the Brazilian state to modernity.

The challenges facing today's governance arrangement of the Brazilian state are to improve the efficiency and effectiveness of the administration and a higher quality of the public service provided to citizens, at the same time as it confronts corruption and increase the legitimacy of governmental action in society. These challenges are essential for the governance arrangements set up in Brazil, in order to promote incremental reforms that add value to the public performance of the state.

This entry deals with governance in Brazil from the perspective of the path of institutional change and construction of arrangements for the implementation of public policies and services, in addition to the most important structural challenges in Brazil.

The first section will outline the analytical framework for governance. In the second section, we will discuss the building of the Brazilian state and the governance problems that mobilize the change agenda. Finally, the main challenges for the institutional construction of governance in Brazil will be presented in the last section.

## Framework and Problems

The New Public Management perspective to administrative reforms is a universal tool to improve results in public policy. The New Public Management understands that competition among government agencies, slackening operational standards in public policy formulation and implementation, result-oriented control, budget definition according to performance, and the outsourcing of support activities are of fundamental importance and applicable to different administrations in different contexts. The applicability and universality of those propositions for various political and economic contexts are questionable, especially in the developing countries (Pollitt and Bouckaert 2004; World Bank 2004). The main element that defines New Public Management is the construction of the institutional autonomy of the bureaucracy (Barzelay 1992).

New Public Management starts from a conception of erroneous public management autonomy. The New Public Management ignores the dynamics of public sector and the connection with a democratic political system. The New Public Management considers that autonomy is a detachment between public administration and political system. The premise of governance perspective is that a balance between management autonomy and a democratic order is needed to provide institutional improvement and reforms (Olsen 2009). The concept of governance, in this sense, goes beyond a conception of public management but considers that institutional reforms should promote improvements not only in management

mechanisms but also enhance democratic legitimacy. Governance means how institutions promote solidarity and management capacity, how institutions are accountable to citizens and adapt and learn from their own mistakes, and how institutions promote values that spread development (March and Olsen 1995).

In theory, governance is an institutional arrangement that allows the efficiency and legitimacy work in a political system and society to improve the state capacity (Peters and Pierre 2008). This definition is the first wave that sought to understand the constituent elements of improving the state's capacity to implement public policies. Primarily, governance is about the collective interests in government, evolving state and society to define and implement collective objectives. The governance concept is not new. However, contemporary reforms in public administration and political system consider the governance perspective because it promotes a process of change focused on the govern process and the relationship between government and society (Stoker 1997).

The development of the concept of governance had a second wave. The second wave focused attention from a social perspective. In the face of fragmentation and the interests of society, this governance perspective considers that social actors are capable of building networks and influencing decision-making and policy implementation (Rhodes 2012). Networks are a governance structures and expand the perspective about the role of public administration. The network governance is not government-centric to public administration, but a growing complexity within the state and society and a perspective to improve institutions with a political participation and enlarge the democratic channels.

The definition of governance transcends the managerial and administrative mechanisms. It represents a process that connects mechanisms of administration to the political and infrastructural aspect of authority (Fukuyama 2013). Thus, state capacity and autonomy of public organizations are a vital element of the governance. State capacity must be related to the degree of institutional autonomy. Autonomy consists of the institutions' capacity to conduct public actions regardless of particularistic directives. The interaction of capacity and autonomy constitutes an optimum point at which it is possible to constitute government and administration processes of the highest quality (Fukuyama 2013).

Unlike New Public Management, the governance perspective does not provide a universal solution for public sector reforms. The central concern is to promote a more robust institutional arrangement that enables the improvement of the quality of public services in the context of a democratic public administration and subject to mechanisms of compliance and accountability. The governance perspective focused the institutional development in context, without a universal solution to public administrations.

More than a closed perspective of a theory, the perspective of governance is a strategy. The governance strategy is a way for the institutional improvement of public services and public policies. Essentially, the governance strategy seeks to make the actions of public organizations align with the interests of society and make it more capable of achieving its mission (Capano et al. 2014). The governance strategy means conducting a process of institutional change that recognizes the role of bureaucracy in the formulation and implementation of public policies and services, associated with a political system that ensures greater openness and connection with society.

There are three elements of a governance strategy: Firstly, improving transparency and accountability to achieve compliance; secondly, the creation of channels of participation and networks with society; and, thirdly, the creation of mechanisms of political coordination in multilevel organizations. These tools, together, have an objective of strengthening the legitimacy of public policies and administration by government action in society (Peters and Pierre 2016).

Governance embraces not only the development of economic aspects but also criteria that seek to qualify its management mechanisms. These qualities are noneconomic factors such as subjective happiness, citizen support for government, and democratic stability. The governance perspective recognizes the qualitative aspect of government in the light of public policies and

services supply that recognizes the value of equity as a founding principle of the political regime and a fundamental public value of the administration (Rothstein and Teorell 2008).

Governance is the administration in governing process that goes beyond the managerial sphere and in which the quality of public services matters for citizenship (Peters and Pierre 2000). Governance means administering *in* public. This meaning is that legitimacy of state's action matters, in addition to efficiency and efficacy, bearing in mind public policies and services capable of fostering equity and adding public value. Embracing that concept of governance is the affirmation that the quality of government matters, taking quality to be its capacity to act and produce equitable results for society at large, impermeability to corruption, and the fully legitimate exercise of public authority (Rothstein 2010).

The governance strategy has tools that promote an institutional change. These tools are transparency and accountability, participation, and policy coordination. The governance tools challenges the public administration.

The problem of transparency is ensuring the information to citizens. Transparency is linked to accountability to promote a political responsibility. Political responsibility is the adherence between government action and public interest. Political responsibility is impossible without transparent institutions and a reduction in the informational deficit between the citizen and institutions. Governance presupposes some kind of free knowledge from the part of the citizen. In this case, for this knowledge to be possible, it is essential that public organizations are clear, informative, and accountable to the citizen. Transparency becomes an instrumental value toward the exercise of accountability.

However, it is important to consider the limits of the idea of transparency. Transparency requires freedom of information so that citizens can then assess and make judgments about policies implemented by governments. But the cognitive capacities of citizens and the process of information production are not considered in this process of transparency. An adverse effect of transparency is to produce a policy of scandal because private reasons end up being most important for the issuance of judgment by citizens. The transparency can affect the trust in institutions.

Accountability, in other hand, depends on the existence of institutions that are authorized and willing to control, supervise, rectify, and punish the actions undertaken by public agents, which are considered illegal by other, independent agencies and represent a departure from the public interest (Filgueiras 2016). The accountability institutions must be autonomous and recognized by their personnel as bearers of a public authority for the supervision, control, correction, and punishment of illegal acts, in order to preserve the public interest.

In this way, the accountability institutions imply a complex network, in which institutional competences are specific, but the actions of each institution depend on a process of sequencing and institutional cooperation with other institutions. Conceptually, accountability is the duty of public agents to be accountable to their principals, who, in a democratic regime, are citizens. In a democracy, accountability is an institutional mechanism by which citizens must influence and control their elected representatives, non-elected officials, and other power holders (Olsen 2017).

Like transparency, accountability can have unintended consequences. The accountability challenges the governance. While elections are assumed to be capable of enforcing the accountability of elected officials, dealing with career expert officials in the bureaucracy presents is a more difficult challenge. A wide array of instruments for enforcing accountability have been developed (Bovens et al. 2014), all intended to provide elected officials, and ordinary citizens, the means of controlling their public administration. Accountability is a normative principle aimed at promoting information and transparency and ensuring the publicity conditions of public organizations in the context of a democracy (Filgueiras 2016; Bovens et al. 2014). In this sense, the greater the accountability, the greater the possibility of institutional learning in the context of democracies.

The problem, however, is that it can promote unintended effects that affect the efficiency of

public policies. The accountability institutions can create overcontrol that produces undersupply of public goods because public managers prefer the paralysis of governing process. Accountability can promote red tape effects within the over-regulation of policy process in the public organizations and pass the buck behavior of the public managers.

Accountability and transparency should be thought of as tools for the institutional development of governance, so that greater availability of information for citizens and enforcement mechanisms for compliance will result in greater learning for government officials and managers.

Another tool to achieve governance is participation. Governance requires participation and deliberation mechanisms capable of aligning the public interest with the mechanisms for planning projects related to policies and services that government provides to society. Political participation and deliberation mechanisms enhance the legitimacy of the governance process and serve to constitute a perception of greater equity in decision-making processes.

Participation is based on a pragmatic process that creates participative institutions that make the decision-making processes less permeable to the interests of big groups and other less inclusive interests of society. Participation expands democratic inclusion, creating a perception, on the part of the community, of a greater degree of fairness/justice. In governance perspective, public administration is a place to democratization of the state.

Another form of the participation that achieves governance is co-creation of public services. The improvement of services depends on the open government that can influence citizens in the design of public services (Osborne et al. 2018). The co-production and co-creation of public services enable the citizen to intervene in the design of public services, so as to provide citizen participation in the creation of all stages of services to facilitate the delivery process to society (Bovaird et al. 2015).

Finally, a key tool for achieving governance is the coordination of public policies. The solution to the constant problems identified by the different stakeholders in relation to public policies would be not only in the use of information but also in the coordination challenges between the actors and the organizations that formulate and implement them. However, this is not a problem restricted to governments but concerns all large organizations, whether public or private (Peters 1998). Citizens and the business community need to go from agency to agency to have access to the benefits to which they are entitled. Many government programs are contradictory, and others may have gaps that fail to provide services to which citizens are entitled. These failures result from coordination difficulties (Bouckaert et al. 2016). Going further, reforming public policies has a mantra: we need more coordination.

The coordination of public policies is also required between organizations and political and bureaucratic actors that comprise the same level of government (horizontal coordination) or that comprise different levels of government (vertical coordination). In the sense of coordination, these actors and agencies play different roles in different phases of the same public policy. Coordination is a problem of collective action involving different public organizations, policy stakeholders, and the provision of services to citizens. If one aspect of governance is to perform policies and services to achieve collective goals, coordination necessarily means a problem of collective action.

How can organizations and actors cooperate so that government achieves collective goals and objectives? Coordination requires policy-monitoring tools and strategic planning to mitigate the adverse effects of noncooperation. In this case, political authority is fundamental so that coordination activities can solve the problems of collective action. Coordination activities, therefore, are critical to achieving legitimacy and must be carried out at the center of government (Bouckaert et al. 2016).

The governance perspective seeks to ensure that governments and public administration act in the public interest and that this action has legitimacy vis-à-vis society. Governance takes place in the context of a public administration that is more permeable to society and, at the same time, more autonomous in relation to private interests and, also, in a more capable administration to perform

policies and services that produce impact, equity, and justice. This analytical framework of governance will be applied in the analysis of the Brazilian case, according to the next section, which examines the historical building of governance in Brazil.

## The Path of Governance in Brazil

The literature on governance in Brazil recognizes that the construction of the Brazilian state and public administration responds to three phases: (1) patrimonialism, (2) the Weberian bureaucratic, and (3) the New Public Management (Bresser-Pereira 2001). These three phases should be understood as an analytical mechanism. Each of them preserves historical specificities and circumstances. And each of these phases does not completely replace. There are still traces of patrimonialism in Brazilian public management, while the mechanisms of the New Public Management have advanced in the context of a Weberian bureaucracy. The understanding of these three phases is the constitution of historical challenges for governance in Brazil and the process of institutional development of public administration.

Beginning with patrimonialism, it has been a concept of fundamental importance in Brazil as an analytical and theoretical instrument to build an interpretation of the formation of the state. The assumption is that Brazilian political tradition does not respect the separation of the public and the private, and the Brazilian state is not an example of a modern state legitimized by impersonal and rational norms. Patrimonialism, more than a type of organization, would be more of a system that legitimizes the government in the light of privileges, in the context of society of the realm type, inherited from the Iberian world. Patrimonialism is a typical problem of the state and embraces a structural vision that enables it to reproduce itself, albeit with some hints of modernization.

The meaning of patrimonialism in Brazil is built in a society governed by the bureaucratic privileges. In the process of colonization of Brazil, the state created society in a hierarchical and rigid social structure based on the exploitation of privileges. Once the state overlaps with society, the bureaucracy has become the locus of the privilege structure. In Brazil, a bureaucratic state was formed before society. This made it possible to create a hierarchical society and moved by patronage, clientelism, and corruption (Faoro 2000).

The Brazilian state and public administration were formed during the colonial period. This is especially true in 1808, when the Portuguese Royal Family arrived in Rio de Janeiro. The arrival of the Royal Family and the bureaucracy of the Portuguese state promoted the "metropolitan inversion." Due to the circumstances of the Napoleonic wars, the conduct of the Portuguese state apparatus took place from Brazil, which assumed the functions of metropolis and, consequently, national state. In the Brazilian imperial period, the first attempts were made to organize careers in public administration, especially in the field of finance and the armed forces (Costa 2018).

However, the public administration was founded by the patrimonialist conception. The state bureaucracy in Brazil was institutionalized by personalism and political hierarchies, and in this context, there was no separation between the means of administration and politics. In the context of patrimonialism, corruption is an informal institution because it constituted a rule for government and relations between the public and the private (Faoro 2000).

Patrimonialism persisted from the colonization process to the modernizing reforms of the 1930s. In the course of the twentieth century, Brazil gradually took on a modernizing posture. This modernization project was centered on the pursuance of elements of rationalization and cultural transformation capable of orientating a project intended to design the public sphere in accordance with the principles of capitalism and development. The modernization of the state and the creation of a Weberian public administration took place in the context of an authoritarian political system. The argument for the adoption of an authoritarian regime to promote the modernization project was that change should occur through the exercise of state authority for the transformation of society and the break with inherited patrimonialism of the colonization process.

The transformations in public administration occurred in an authoritarian state, in the context of Vargas dictatorship, changing the administrative structure by adopting the Weberian model. The modernizing project in Brazil would have the state bureaucracy as principal actor. The bureaucracy consolidated the separation of the means of administration from the exercise of government posts and positions. The state, over and above society, took on the role of the Republican subject, capable of creating a public policy doctrine; a project for democracy that involved the transformation of society to combat corruption promotes economic modernization and cultural change.

The change effectively took place with the adoption of a bureaucratic Weberian model for the organization of the state. The first moment was the creation of the Department for Public Service (Departamento Administrativo do Serviço Público (DASP)) in 1938. The creation of the DASP was based on the personnel system reform and the establishment and simplification of administrative systems and government budgeting activities in alignment with a bureaucratic model. The aim is improving the efficiency of the public service. Within the project of modernization from the top, the Brazilian public administration reform was centered on the Executive Branch and its technical capacity to which it attributed the task of conducting the reforms in accordance with a project that was centralizing and authoritarian, aiming at formal rationality.

Two groups were essential in this process of creating and transforming public organizations: First, the military that acted as political actors in the modernization of public administration, coordinating the major projects of change of the organizations, and, second, the financial area, considering the performance of economists in development and industrialization projects in Brazil. The presence of these two central actors takes place since the imperial period, when these two organized groups began to work for modernization. The performance of military and economists formed the hierarchical structure and careers of the public sector, as well as a modern rationality for public organizations.

The return of democracy in 1946 kept the DASP going. However, it meant an institutional breakdown of public organizations. The increasing disorganization of the DASP that accompanied the reconstruction of democracy in 1946 led to the nomination of non-career employees in the civil service, the disorganization of government budgets and of purchasing and control mechanisms, and, lastly, the burgeoning inefficiency of the management model implemented.

There were no major organizational changes during this period. But the strengthening of the Weberian framework was consolidating. In 1964, there was a new context of change with the return of a dictatorship. Again, the project of modernization of the state and of society took place through authoritarianism, which promoted new changes in public organizations. The justification for an authoritarian regime was to address corruption and the poor quality of government, as well as to promote cultural change within society. From the period between 1930 and 1964, the political regime lacked legitimacy and lived with permanent political instability. In this context, a bureaucratic-authoritarian state was formed in Brazil, with bureaucracy playing a central role in the development process.

With the enactment of 1967 Decree 200, during the military dictatorship, the Weberian public administration model was replaced by a development-oriented model. In the context of developmentalism, the expansion of the state intervention in the economy and the setting up of indirect administration were fundamental elements for ensuring the continuity of the modernizing project and the elimination of the patrimonialism of the past (Bresser-Pereira 2001).

In addition, there was a de-bureaucratization project that would seek to facilitate bureaucratic processes and reduce red tape mechanisms, making them more agile and in that way consolidating a greater degree of efficiency and agility in the administration. However, the developmentalist model became a hostage in a process of interaction with a society strongly impregnated with privatization. The constitution of "bureaucratic rings" connected state and society around private interests, maintaining, yet with some modernizing

features, the system of privileges typical of the patrimonialist regime.

The advance of the transformations of the public organizations during the dictatorship occurred with a technocratic perspective, especially in the economic area and in the infrastructure policy, creating a Weberian bureaucracy associated to a conception of development led by the state. But on the other hand, part of the state bureaucracy became permeable to patronage and corporatism, with corruption as an informal rule in the public-private relationship.

With the end of authoritarian rule and the transition to democracy, from 1985 on, the administrative model set up by the Decree 200 fragmented by its increasing disorganization and disarticulation. Authoritarianism had created a technocratic vision and aggravated Brazilian public administration's historical problems, resulting in loss of financial control, lack of accountability of authorities and bureaucrats, improper political influence in the bureaucracy, in addition to excessive fragmentation of public companies, and a loss of focus on governmental performance.

Against that historical background, a profound criticism of the Brazilian bureaucratic apparatus emerged and drove a reform of the administration associated to a management appeal. The criticism was that bureaucracy was eroding the efficiency of organizations due to its internal dysfunctions. Literal adherence to the rules in the form of strict compliance with the regulations had led to a Weberian bureaucracy and a vision of the world that produced adverse side effects that boosted problems. Furthermore, the bureaucratic model was said to have fostered the appearance of a series of sub-organizations within the overall bureaucratic organization, leading to the total de-coordination of activities and policies. In the light of such criticism, the New Public Management model came to the fore, gained vigor in the Brazilian experience and was adopted as the horizon of change.

The administrative reform redefined the sectors of state activity, reinforcing ideas of the democratization of the state and managerial mechanisms configured around the adoption, by the public sector, of private sector administration models (Bresser-Pereira 2001). The administrative reform of the Fernando Henrique Cardoso government adopted the New Public Management model whose objective was to adapt Brazilian public administration to the needs that had emerged from the globalization of the markets, to the increasing presence of international legislation in trade, and to the improvement of managerial mechanisms. The changes were implemented in a way that ensured that government activities would be based on a form of public administration similar to the administration conducted by the private sector, which meant that the citizen would become a client of the services provided by the state (Bresser-Pereira 2001).

The implementation of the New Public Management model in Brazil assumed that public management should be based on the professionalization of public service, a preference for quantitative indicators and explicit performance standards, quantitative control over results, distribution of resources according to policy performance, decentralization of bureaucratic activities, competition among the state's agencies, managerial flexibility, discipline in expenditure, cuts in direct costs, and the establishment of limits to the costs of bureaucratic transactions (Pollit 2003: 27–28). Thus, by assuming that public administration should be based on private sector administration, the New Public Management in Brazil also assumes that policy should be based on the economy, in alignment with the theory of market failures which has the question of efficiency.

In Brazil, the New Public Management brought with it a series of marginal gains that were incorporated to the state's public actions. It did not, however, represent a complete break with the Weberian model. Although the managerial changes that were introduced did lead to institutional, cultural, and administrative changes, it cannot be considered that a rupture with the bureaucratic model occurred because, among other reasons, it can reasonably be questioned whether the Brazilian experience ever actually composed a bureaucratic model in the Weberian mold.

The reform brought with its economy of scale, a reorganization of the public service, and a redirecting of the policy agenda toward changes in the administrative machine. Those changes made it possible to achieve efficiency gains in public policies, better planning and budget control mechanisms, and the introduction of public service regulatory mechanisms and practices that were new to Brazil. Since 2003, new changes have taken place in the public administration, reconstituting a Weberian perspective for the government.

The advance of state reform outlined a Weberian redemption of the bureaucracy, in order to strengthen the professionalization of the public service, to build the autonomy of bureaucracy and the solidification of careers. The reform strategy was to strengthen the center of government, promoting the thrust of the strategic core careers by creating the careers of the Management Cycle. In addition, there was a strong recomposition of the workforce with the valorization of salaries in the public sector and creation of new professional and specialized careers, such as in the area of social policies, infrastructure, and regulation.

The government has favored competitions for the careers of Management Cycle in order to strengthen the management mechanisms, value the income obtained by these careers, and ensure institutional autonomy of the bureaucracy. The reform has followed up on a fundamental aspect of New Public Management, which is to ensure bureaucratic autonomy for careers with decision-making power and responsible for the implementation of public policies.

By strengthening the center of government through the provision of careers outlined in the Management Cycle, the government opted to ensure bureaucratic autonomy, associated with the delineation of the insertion of this bureaucracy and the strengthening of participatory institutions. The aim was to build synergy and insertion of this bureaucracy with society, in order to solidify a conception of public interest capable of qualifying policies and services, in order to establish means for democratic governance.

This synergy between bureaucratic autonomy and participatory institutions would strengthen the capacity of the state to formulate public policies, in order to establish complementary links. Capacity building would occur in accordance with the increased autonomy of the bureaucracy, associated with its political and participatory insertion in the implementation arrangements. The perspective of strengthening governance would occur with the sum of bureaucratic autonomy and political and relational capacities with civil society.

The challenge at that time was to address the problem of political legitimacy. At the same time that the professionalization of the public service has made progress, the state has lived with different corruption scandals, which has greatly affected the legitimacy of the political system and public administration. The reforms changed the career structure and valued the management cycle. However, it was an uncoordinated and unplanned action, maintaining a complex picture of different capacities and autonomy among public organizations. The Brazilian trajectory of the construction of the governance implied in the constitution of robust organizations, autonomous and able coexisting with organizations fragile and captured by private interests.

The long road to governance in Brazil was the result of advances in the structure of the public service and in the definition of public organizations, especially in authoritarian periods, with the process of democratization of the state. This trajectory of public organizations created a very specific concept for governance in Brazil. Governance in Brazil means the association of the development of a Weberian bureaucracy with organizational elements of New Public Management and the need for democratization of the state and greater synergy of public policies with society. This historical trajectory makes the concept of governance complex and multifaceted for the process of change and consolidation of public organizations in Brazil.

Reforms were promoted, aligning bureaucratic development and New Public Management mechanisms and transparency. Associated with this, a governance perspective that promoted the synergy between an autonomous bureaucracy and participatory institutions in civil society was developed. These changes represented necessary, but not sufficient, conditions for scheduling a

comprehensive conception of management reform. Institutional changes, within the federal bureaucracy dimension, occurred. However, they were apart from a comprehensive, coordinated, and solid agenda of institutional change.

The result of this trajectory of construction of public organizations in Brazil was the existence of a multifaceted and complex structure. On the one hand, this structure of organizations has constituted "islands of excellence," while there are inefficient and ineffective organizations permeable to corruption and patronage (Bersch et al. 2016).

The long trajectory of the modernization project of public administration in Brazil has created some "islands of excellence," with autonomous organizations in relation to private interests, little permeable to corruption and with high capacities for the formulation and implementation of public policies. Examples of such organizations are the tax and audit area. On the other hand, several organizations are permeable to corruption, inefficient in providing public services, and with a low capacity for the formulation and implementation of public policies. There are several examples of these organizations, which are present in areas such as health and social.

In this institutional context, with organizations with so much autonomy, capabilities, and results, there are problems regarding the provision of public services and the quality of government. In this context, governance appears in Brazil as a reformist perspective, promoting incremental changes that seek the institutional improvement of the public service. The various problems presented today create a critical juncture for change. In particular, confronting corruption, face the performance of public organizations, and improving the quality of the public service catalyze incremental proposals for reform, which have in the concept of governance the fundamental theoretical model.

## Problems and Challenges of Governance in Brazil

The main problem related to the building of governance in Brazil is the promotion of a robust institutional arrangement that is capable of strengthening the quality of the state's performance in society and, at the same time, promoting greater openness and connection between the state and society. Governance should be understood as an incremental process of state reform in order to improve the performance of public organizations and the legitimacy of governments (Christensen et al. 2016).

The first issue that arises is the deepening of accountability and transparency. The trajectory of these two fundamental themes of governance in Brazil derives from democratization since the Federal Constitution of 1988. Democracy promoted an incremental process of institutional change, in which the organizations responsible for the accountability process were deepening their autonomy and capacity.

Associating high organizational capacity with autonomy, accountability institutions in Brazil were empowered to promote auditing of public policies and organizations, to combat corruption and promote transparency. The capacity of these organizations in Brazil is very robust, having solid career structures, recognition through the best wages, and capillarity to attract the best trained to compose their staff.

Accountability institutions can fulfill an important role of institutional change in the Brazilian public administration. However, this ability to produce change depends on the capacity of the accountability system to generate institutional learning that modifies practices, norms, and organizations. Institutional learning cannot produce the unintended effects generated by the asymmetry of power between accountability and implementation, nor result in instability that promotes the effects of red tape and pass the buck within public organizations. There is an indistinct border between the production of institutional learning and the paralysis of public administration. This is the very challenge of governance in Brazil.

There is an asymmetry in the capacities and autonomy between the organizations responsible for implementing public policies and the organizations responsible for promoting accountability. This asymmetry makes the process of corruption control, audit, and promotion of transparency not

always result in institutional learning for public organizations but in a process of management paralysis and the creation of incentives for behaviors related to the red tape and pass the buck. In addition, the accountability institutions have challenging the political order in Brazil.

Transparency may also affect the quality of decisions being made in the public sector. If decision-making is made more open, then political leaders may find it difficult to make the tough decisions needed for good governance and will instead make more politically palatable decisions. Further, the availability of government information and policy indicators has shifted accountability concerns to performance and away from the process. Transparency is assumed to deliver both democracy and efficiency, and that may be too much to expect of any one instrument, and important elements of democratic processes may be undermined.

Accountability, on the other hand, has produced an undersupply of public goods and services. The reforms conducted in Brazil provided changes that encouraged public servants to take risks. The autonomous and qualified performance of accountability institutions in Brazil reversed this logic. The processes of auditing and control of corruption have promoted a behavior of risk aversion, by public servants. This has created in public organizations an aversion to standard deviation and an organizational culture that discourages innovation. Accountability in Brazil has challenged public management as well as political order. Strengthening the control of corruption has widened society's distrust of institutions.

The second challenge for promoting governance in Brazil is participation. Since the Federal Constitution of 1988, there have been advances in political participation. It occurred not only in the context of electoral participation but also in the formulation of public policies and elements of societal accountability. Brazil is a hybrid institution in which civil society participates through representation in policy-making fora such as public policy councils and policy sector conferences.

The development of participatory institutions has promoted a better quality of the formulation process. However, it faces the same ambiguities and limits that any process of political participation presents. The decisions taken in participatory institutions are not always implemented in the public policies. And, on the other hand, the implementation of policies is isolated from the formulation process, and there is no greater openness in the designs provided in the formulation in activities through services and the provision of public goods. In other words, although there have been many advances in the formulation process with the participation of society, there has not been the same progress in implementation.

The structure of public services and the supply of public goods need more innovative mechanisms on the supply side. Initiatives of co-production and co-creation of public services are still timid and with few effects measured. Initiatives of co-production and co-creation of public services could represent an advance in Brazil, especially in strategies of redesign and digital transformation of services.

Finally, policy coordination challenges governance in Brazil. Governance implies that government must be able to implement policies and services directly to the citizen in order to produce equitable outcomes associated with efficiency and effectiveness for problem solving (Peters 1998). Coordination means a permanent dialogue with society, the production of monitoring mechanisms, and permanent evaluation of public policies and dialogues with the various institutional actors in a complex context (Peters and Pierre 2016).

The main challenge of policy coordination in Brazil is to create institutional conditions for complex and asymmetric federalism, where states have little economic and institutional autonomy vis-à-vis the union. In addition, the implementation of policies occurs with the performance of 5570 municipalities that are considered by the 1988 Constitution as federated entities. In the context of a complex federalism, with several institutional actors, the task of coordination becomes vital in the arrangement of Brazilian governance.

The use of these three tools for the construction of governance in Brazil has encountered difficulties in what concerns the unintended effects of a

strategy of institutional change. Overcoming these challenges means that a governance strategy is capable of promoting institutional learning to ensure a more democratic public administration intertwined with more legitimate governments with enhanced confidence and capacities to meet the diverse challenges of the public service.

The main challenge of governance in Brazil is to address the structural problems of society at the same time as institutional changes are made. Institutions matter to promote more equitable and egalitarian societies, and governance arrangements can be a good response to this, provided they are able to deal with mistakes, promote constant improvements, and strengthen the democratic linkage of public administration.

## Introduction

In the past 30 years, there has been a significant growth in the literature on governance within political science, in part as a response to the decline of the state's traditional role and capacity in developed countries. The governance literature seeks to offer new forms of governing system analysis in the transforming political arenas after the 1980s. This set of new approaches in political science literature has prompted the renewed debate on the state. The debate on governance has helped bring the state back in to political science literature partly because the period of the government in which it was supposed to address many of key political issues in society was replaced by a new era in which the term "governance" is employed to address the set of governing processes. Namely, examining "government" does not always respond to the issues of governing any longer. Elsewhere, the concept of the state, which was not always been heeded by political research despite its traditional significance, has reemerged as a topic of debate to address political issues in transforming society. For example, one school of literature has proposed a hollowing out of the state (e.g., Rhodes 1997), while others have argued for the transformation or reconstitution of the state (e.g., Marsh et al. 2001). However, the debate on the state and governance has not extensively been addressed in the literature regarding power and politics in Japan. This entry addresses the changing governance in Japan with specific attention to power and the state focusing in particular the period after the 1980s, when political science literature start debating the change of governance in political arenas. In so doing, it unfolds the nature and development of governance in Japan, heeding the extent to which the transformation of the state has been influential. Referring to previous governance literature including those within this encyclopedia (e.g., "▶ Governance Theories and Models"), this entry defines "governance" as the set of political systems that governs the state and society; the scope of the term covers the nexus of public administration actors and structures influential over policy-making and implementation, both those within the government and beyond.

This entry first reviews the challenges for states emerging after the 1970s, which prompted the interest in governance instead of government among political scientists. It is followed by the specific examination of how governance has changed in Japan's political arena, heeding key political events such as the 1994 political reform and the 1997 administrative reform. The final section pulls the above together and reveals the extent to which the governance of Japan can be characterized as a variation of the emerging mode of governance in political arenas elsewhere under a specific political tradition.

## From Government to Governance

The era of governance has been preceded by that of government after World War II, which can be characterized by the expanded state pursuing full employment and social welfare. The left's significant contribution to the war efforts against

fascism and the widespread belief that the Great Depression facilitated the rise of fascism made full employment and social welfare the top priority of the political agenda (Chang and Rowthorn 1995: 3). As key industrial countries rebuilt their societies, the size and scope of governments unprecedentedly expanded with the emergence of the welfare state. Indeed, the welfare state in this period accounts for in excess of 50% of GDP and 15% of the total workforce (Hay and Lister 2006: 6). The governments of developed countries in this period can be characterized by increasing government expenditure – expenditure in the 1990s was double that in the 1930s (Hay and Lister 2006: 2–3), expanding government projects, and growing political intervention in markets, the extent of which varied (Pierre and Peters 2000: 2). The government of this period was the appropriate, legitimate, and unchallenged solution for social change, equality, and the economic development, with regulation, economic redistribution, and, more generally, an expansion of the political sphere of society; indeed, in the view of the 1950s and early 1960s social scientists "political issues would be transformed into administrative and non-controversial routines" given the long-term economic growth (Maier 1987: 4). The state of the developed world of this period can be exemplified by Bob Jessop's Keynesian Welfare National State, whose core theme aims at the management of the economy and society by the state, which was supposed to address market failure and be responsible for developing and managing welfare programs.

However, the state with its expanded scope and activities encountered significant challenges after the 1970s, the key points of which are in Table 1:

This set of challenges led the state to adapt to its new environment by changing its internal and external power relations with key actors. For example in Japan, the significant public antagonism against the system and elites in politics resulting from enduring financial scandals and the failure of the traditional government machine to effectively address the economic downturn and extravagant government debt emerged as key challenges after the 1990s, together with the piecemeal but creeping rise of neo-liberal approaches such as contracting and privatization and the increasing complexity of society involving growing number of NGOs and the call for devolution. The adaptation has undermined the previous mode under which the governing system was controlled by government and prompted the new ones in which the networks of relevant actors play a major role in policy-making. The changes also prompted political science literature to reexamine the governing system, employing the term "governance" instead of the previous focus on "government." The origin of the term "governance" was an old French word "*gouvernance*" in the fourteenth century, in the focus of interest to explain the state's adaptation in response to the challenges outlined above (Pierre and Peters 2000: 1, 18). The concept of governance emerged as a new vehicle to address the changing politics and society throughout disciplines. A wide range of topics has been debated by governance literature across disciplines, including development economics, international institutions and regimes, organizational management such as corporate and public sector governance, NPM, and the new practices of coordinating activities through networks, partnerships, and deliberative forums, which took over the role of the state until the 1970s (Hirst 2000: 14–19; see "▶ Governance Theories and Models"). If one turns to governance literature specifically aiming at politics, power, and the state, what appears is the following two approaches: state centric or society centric (Richards 2008: 96–98). The former highlights the state's political and institutional capacity to steer and how its role relates to the interests of other influential actors, focusing on the responses of the state to challenges; the latter pursues the coordination and various forms of formal or informal public–private interaction, such as policy networks, focusing on the network of actors to formulate policies responding to the challenges. An example of key approaches within the course of debate is the concept of the core executive, drawn from the debate within the Anglo-Governance School – a group of scholars whose position is affected by R. A. W. Rhodes' idea that the concept of governance be integrated "into a

**Governance, Japan, Table 1** Key challenges to the modern state (Pierre and Peters 2000: 52–67)

| | |
|---|---|
| Financial crisis | The state confronted its increasing expenditure and difficult prospect to increase tax revenue |
| The rise of the new right | The manifestation of neo-liberal ideology emerged in the governments in a number of developed countries. They employed monetarist economic policy together with deregulation, privatization, drastic reductions in the civil service, the introduction of "managerialism" in the public sector, and institutional restructuring of the state creating semiautonomous public organizations to typically replace government organizations |
| Globalization | Globalization has partially stripped the traditional authority of the state but offered new opportunities to exercise influence through regional and international organizations and through international institutional coordination such as transnational harmonization of regulation. It has contributed to the transformation of the state's traditional approach to private firms. The effectiveness of the state's traditional approach to its economy and private firms has waned |
| Failure of the state | The expectation for the governments to address societal problems in developed countries exceeded the actual capacity of the governments |
| NPM (New Public Management) | The rise of NPM challenged the traditional approaches of the state in the developed world and brought a shift from government based on direct service provision with top-down bureaucracy to government with fragmented segmentation providing the services through private sector suppliers by contracting and privatization |
| Social change, increasing complexities, new source of governance, and legacy of traditional political accountability | The more complicated nature of society, such as blurring the public–private sector boundaries, rendered the policy-making process to seek alternatives to the previous approach. The complexities are contributed by the emergence of new public actors such as enhanced local governments and regional organizations such as the European Union. The emergence of new societal actors such as the NGOs brought a challenge to the traditional chain of accountability through democratically elected officials; they struggle to be represented through the traditional chain of accountability designed for the traditional societal actors |

conceptual model of contemporary government, its evolution and its relationship to political and wider social processes" (Marinetto 2003: 594; see also "Core Executive in Japan"). The concept aims at the core mechanism of the state based on its ontological view of power that is fluid and relational within the core executive. What is common among this set of ideas is the change of the body of governing from a single and centralized government to the nexus of actors engaging in policy-making either within the core of the governing mechanism or the network involving key actors in both the state and society.

The impact of the change of governance can be observed in a variety of examples, whose specific outcomes have been formed under respective political traditions. The following section will examine the development of governance in Japan, heeding key political issues specifically affected the course of the country's political development.

## Political Development and Governance in Japan

The analysis of Japan's political arenas was dominated by approaches focusing on central government officials as key before the 1980s (e.g., Tsuji 1969; Johnson 1982). This reflects the period dominated by the stable administration of the Liberal Democratic Party (LDP), which enjoyed a continuous tenure since its establishment in 1955. In particular, the 1960s and early 1970s saw the significant economic development called "High Growth Period" under the Hayato Ikeda (PM: 1960–1964) and Eisaku Satō (PM: 1964–1972) Governments, in which the impact of government policy was regarded as a significant factor contributing to the rapid rise of living standard of the country. Although the nature of the rapid economic growth is a contentious topic many recognize policy-making processes steered by government officials and overseen by LDP

politicians as influential (e.g., Johnson 1982; see also "Politics Administration Relations"). This set of governing mechanism steered by government officials had analogues to the Weberian state model. What was unusual in Japan is the significant impact of the ruling party politicians outside the Cabinet: they inserted influence over policy-making within the LDP's informal policy-making bodies including the Policy Affairs Research Council (PARC). They belonged to the community in which a group of politicians specialized in specific fields (*zoku gi'in*), many of whom were former Cabinet Ministers responsible for the affairs (Inoguchi and Iwai 1987). In the 1970s, Japan encountered significant political and economic crises. The emergence of corruption scandals in politics culminated the financial scandal involving then Prime Minister Kakuei Tanaka (PM: 1972–1974) and the following Lockheed bribery scandals in 1976, part of which directly involved Tanaka. This set of scandals resulted in public anger against the LDP and undermined its popular support. What came together was the 1973 Oil Crisis and the series of economic measures by then US President Nixon called "Nixon Shock," which led to the end of the Bretton Woods system of monetary management. The concomitant economic turmoil prompted corporate scandals including the price controls of daily commodities by trading companies and cartels. The response to this set of political and economic crisis was the gradual transformation of the LDP and political and economic structures. The financial scandals in the 1970s involving LDP politicians prompted the strong antagonism against "money politics" [*kinken seiji*], which significantly exacerbated the public distrust of the political system and politicians. The economic crisis prompted the call for the administrative reform, which was the prioritized project by the Yasuhiro Nakasone Government (1982–1987). However, although the resulting privatization of three public corporations (telecommunications & tobacco 1985, railways 1987) attracted significant attention the impact of neo-liberal policies were generally limited in the 1970s and 1980s because established and persistent political and economic structures resisted neo-liberal reforms (see "Governance: Privatization and Deregulation in Japan Since the 1980s"). Indeed, Japan has sometimes partially evoked policies based on a market oriented philosophy, but it has been reluctant to thoroughly embrace them (Pierre and Peters 2000: 3) so that it could protect its embedded structure. As such, governing in the 1980s retained the traditional approach mobilized by the government although the influence of *zoku gi'in* enhanced its impact on policy-making processes (Inoguchi and Iwai 1987).

Transformation gradually emerged in the 1990s prompted by a set of reforms including the 1994 political reform and the 1997 administrative reform with concomitant societal changes. The 1994 political reform set out to address public anger against the LDP prompted by rampant scandals involving a number of top LDP politicians in the late 1980s such as the Recruit scandal in 1988 and Tokyo *Sagawa kyūbin* scandal in 1992. A key component of the reform is the replacement of the traditional SNTV (single nontransferrable voting) system with the MMM (mixed member majoritarian) system together with the introduction of public funding for political parties. The impact of the electoral system change reshaped the system and organization of political parties. As the member of the House of Representatives [*Shūgi'in*] are now selected from single member districts (SMD), where only a single candidate is elected as the representative, and the proportional representative (PR) system drawn from the party's PR candidate list, top political party officials obtain significant leverage to administer their party through authorizing candidates. The introduction of the government subsidy to political parties and concomitant restriction of private entities' direct funding toward each politician have set the framework regulating Japan's political parties finances. Under the new system, the party management receives government funds to allocate local party branches headed by Diet members or their candidates. A key outcome of the 1994 political reform was the centralized power of the party management within their respective party, which has contributed to shaping the stronger Prime Minister and Cabinet after the 2000s. Another key contributory factor shaping a strong central government

was the 1997 administrative reform adopted by the Ryūtarō Hashimoto Administration in 1997, which strengthened the power of the Prime Minister and the Cabinet in relation to bureaucracy together with the reorganization of the government organizations and the establishment of independent administrative agencies [*dokuritsu gyōsei hōjin*]. After its implementation in 2001, the 1997 administrative reform transformed the civil service, which had been a key body of administrative power, into a set of organizations more systematically administered by the Prime Minister and the Cabinet. The explicit impact of this set of reforms was observed in the political project under the Jun'ichirō Koizumi Administration (2001–2006). The enactment of the 1998 NPO (non-pofit organization) Law also established the institutional foundation of nongovernment organizations in Japan, which have a potential to cover activities traditionally overseen by the government. Although it has augmented the development of the sector, the organizations have not significantly affected the development of governance in Japan with neither sizable professional groups nor clear strategies influential over the public sphere and policy-making (McCargo 2013: 179–180).

Although Japan's transformation of the state and governance attracted scholarly attention in the 1990s, its explicit impact was widely observed in the 2000s including the tenure of the Koizumi Administration. The LDP Administration in the 2000s saw the gradual and piecemeal development of elected officials, e.g., the Prime Minister and the Cabinet Ministers, who mobilized popular support through engaging in politicization, and the contrasting decline of ruling party politicians outside the Cabinet although some Cabinets had comparatively short tenure. A key issue of the LDP Administration in the 2000s was the party governance. Indeed, a major challenge to the Koizumi Government was their internal opponents within the LDP itself rather than opposition parties. The change of power relations within the LDP from its politicians outside the Cabinet to Koizumi, the Prime Minister's Office (*Kantei*), and his Ministers culminated in the 2005 postal reform and his victory over internal enemies within the LDP. After Koizumi's landslide victory of the 2005 general election, he dominated the country's political arena with unchallengeable power within the LDP in addition to the LDP's overwhelming majority in the National Diet. Koizumi's example exhibits the growing power of the Prime Minister and the Cabinet vis-à-vis politicians outside the Cabinet.

Elsewhere, the transformation of the relationship between the state and society after the 1990s through the reforms of regulation and public spending gradually changed the nature of government officials in policy-making. As typically observed in information and communications regulation, the bureaucratic approach gradually shifts its focus from discretional measures including market entry permissions to those based on rules such as overseeing network interconnection disputes (Mogaki 2015). In particular, the policy projects explicitly mobilized by neo-liberal rhetoric with the mantra of "*Kan kara min e*" [from the official to the private] under the Koizumi Administration aimed to reform established economic structures, exemplifying reformist politics in the 2000s. The administration pursued spending cut in public investment, privatization (e.g., highway, postal services), deregulation, and devolution through its prioritized structural reform projects. Together with the impact of the 1997 administrative reform, this set of measures reshaped the nature and power of civil servants in policy-making, who gradually refrained from acting as the strategist. Government change from the LDP to the DPJ (Democratic Party of Japan) resulted from the landslide victory of the 2009 general election offered an explicit landmark of this trend.

Despite the significant popular support in the 2009 general election, governance under the DPJ Administration between 2009 and 2013 can be characterized by its unsystematic approach to governing and resulting turmoil, the insignificant impact of its domestic policies, and unpopular crisis management (e.g., RJIF 2013). The administration intended to replace the previous public policy-making processes

under the LDP Administration with its own, in which the Cabinet functioned as a sole body responsible for policy-making; for this purpose it abolished its Policy Research Committee (PRC), the equivalent to the LDP PARC. This measure did not work because of the DPJ's failure to smoothly incorporate bureaucracy into its policy-making machine. Rather, what the DPJ actually did is the gradual regression to the traditional approach established by the LPD through the revival of the PRC and its enhancement. In this way, the impact of the DPJ Administration was not as striking as many observers initially expected. However, it also marked a clear disjuncture between the traditional governing under the LDP and a new period in which policy-making is steered by the Prime Minister and the Cabinet. The gradual decline of the power of the LDP politicians outside the Cabinet in the 2000s was accelerated by the emergence of the DPJ Administration. The impact of their power has never recovered within policy-making arenas as party politicians outside the Cabinet have never played a key role in policy-making after 2009 in both the DPJ and LDP Administrations. Elsewhere, the power of the core, i.e., the Prime Minister, the *Kantei*, the Cabinet, and its Ministers, has grown in the 2000s including the LDP Koizumi Administration. The DPJ Administration enhanced this trend but did not demonstrate a new mode of governance. What happened instead was the emergence of unstable conditions rather than new equilibrium. Indeed, the DPJ Administration has often been criticized for its lack of governing ability, e.g., the failure to form a consensus within the party and to mobilize bureaucracy to achieve its goals, which resulted in the failure of its governance reform initiatives including its policy-making system led by elected officials (e.g., RJIF 2013). Together with their status as a minority government within the House of Councillors resulting from the failed election in 2010, the administration exhibited insufficient ability to generate strong policy outcomes. Elsewhere, in spite of remarkable political disputes between the DPJ and opposition parties within the National Diet, under the DPJ led Coalition Government the state retained its significance in policy-making like the LDP led Coalition Government in the 2000s although its core experienced the fluid change of power between key actors.

The 2012 government change from the DPJ to the LDP restored the LDP's previous policy-making framework including the PARC's preliminary examination system. The ostensible outcome of the event was the restoration of the previous regime and approaches. However, a broader trend that reshaped the governance of Japan has significantly affected the LDP Administration after 2012. As of 2017, the power of the Prime Minister is regarded as key in Japan's policy-making processes together with his aides such as the *Kantei*, the Chief Cabinet Secretary, and other Cabinet Ministers. Although the ruling party politicians outside the Cabinet have regained their previous position as an actor in policy-making, few commentators identified the cases in which their impact is comparable to that in the 1980s (Yomiuri online 2014). Likewise, few argue for the impact of government ministries as the key strategist. Indeed, different from Johnson's (1982) equivalent in the 1970s the explicit impact of government ministries was limited after 2012. This could reflect the fact that the institutional foundation of the Prime Minister's power has been enhanced by the 1997 administrative reform and successive measures including the establishment of the Cabinet Bureau of Personnel Affairs that oversees the appointments of senior civil servants in 2014. The resulting performance of the LDP Abe Administration is, however, a topic of examination. The LDP Administration after 2012 has experienced few internal conflicts within their own party because not only the LDP President/Prime Minister authorizes the registration of a candidate but also he has not engaged in policy projects that significantly undermine the interest and power of fellow LDP politicians (Pekkanen et al. 2016). The administration also enjoyed significant advantages caused by the weakness of opposition parties such as the DPJ/DP

(Democratic Party: the successor of the DPJ established in 2016) (Noble 2016). Whether or not the dominance is sustainable without either of these factors is a question to be seen.

## Conclusion: The Nature of Governance, Japan

The past 30 years has seen the transformation of governance in Japan, which can be regarded as a version of changing governance in a specific political tradition. Key characteristics include the significance of ruling party politicians outside the Cabinet, i.e., those outside formal lines, the increasing power of the core, the changing role of government officials, and the piecemeal entrenchment of neo-liberal approaches. Power within the community of ruling party politicians fluidly moved from those outside the Cabinet to the core: the Prime Minister, the Prime Minister's Office, and the Cabinet. The power transfer was accompanied by the transformation of the nature of government officials as a state actor. With this set of changes mobilized by the reforms after the 1990s, the core executive as a network of key actors engaging in policy-making has thus retained its dominance in political arenas mobilized by established policy-making structures and the prevalent interest in a stronger core among political elites. Elsewhere, in spite of neo-liberal policy measures – or reformist projects – from the 1980s onwards that attracted significant public attention, the impact of nonstate actors such as the business, NPOs, and local governments has been limited in policy-making. An example could be the long-lasting efforts aiming at devolution [*chihōbunken*]. Although both the LDP and DPJ have explicitly called for the transfer of authority and fund to local governments, observers recognize the enduring power of the central government (e.g., Kanai 2007). The transformation of governance in Japan has resulted in not the empowerment of actors outside the core but the continual dominance of the core executive with flexible change of internal power relations.

The LDP Government after 2012 has widely been regarded as strong with ineffective opposition parties and no strong internal rivals. Some attribute its strength to the culminated structures surrounding the Prime Minister. Elsewhere, one can remember the facts that even before the 1970s, Prime Ministers such as Ikeda and Satō exercised significant power within the political arena of the day and that the power of the DPJ Administration (2009–2013) was not very strong even though it was under the same institutional framework as the LDP Administration's after 2012. These previous examples suggest the significance of agency in the strength of the LDP Administration after 2012 rather than that of structures.

The change of governance in Japan has come with the increasing politicization of policy issues dominated by the core and the transformation of the traditional Weberian state; they are widely recognized as key characteristics of the transformation of governance elsewhere. However, it has also been shaped within the specific political conditions such as the lack of an explicit and collective framework that administers political parties, the normative division between the legislature and the executive under a parliamentary system, and the entrenched tradition of bureaucracy's generalist approach. Whereas a strong administration mobilized by populist approaches and politicization has a potential to extend its engagement beyond the institutional and conventional limitation of democracy, the intensified specialism in contemporary public administration could offer unprecedented challenges to the generalist administrative apparatus. For example, significant regulatory failures such as the 2011 Fukushima Dai'ich Nuclear Power Plant and the frequent scandals of earthquake-resistant design forgery in large apartments after the mid-2000s can cast doubt regarding the regulatory competency of the Japanese government. Looming financial difficulty of the country's pension system offers another example. In spite of the relative strength of the core executive within the domestic political arena, the governance of Japan is confronting challenges that impose on the country the serious examination of its governing capability.

# Governance, Local Communities, and Citizens Participation

Alessandra Ricciardelli
Faculty of Economics, Università LUM Jean Monnet, Casamassima, BA, Italy

## Synonyms

Capacity building; Citizen engagement; Citizen participation; Network-based governance

## Definition

Governance and local community's participation refers to the citizens' capacity of engaging in public management affairs not merely through participating in voting and other democratic-based processes which keep policymakers accountable to the public interest, but, more significantly, by taking part in decision-making that would ultimately respond more proactively to citizen concerns.

## Introduction

The most powerful force propelling the Governance paradigm forward is citizen participation, which amounts to a significant hosting of new emerging consultative systems and practices. The paradigm of Governance, indeed, implies, inherently, the commonly held view of the pivotal

G

role played by the community, intended as people working together. Shared values in the same setting influence attitudes, behavior, and relationships between individuals. This occurs through the creation of a shared understanding of the goals to be achieved and the use of instruments and mechanisms that facilitate the decision-making. A significant subject matter pondered in the ample governance debate is the "governing without government" postulation that Rhodes introduced (1996, 1997, 1999). Hence, the Governance perspective offers the promise of greater citizen participation and empowerment by successfully integrating single individuals within the network through the establishment of goal and value convergence, as Skelcher (1998) assumed, in order to effectively respond to newly arising conditions.

As argued, modernization (Newman 2002) and Governance (Rhodes 1996) are terms that actually reflect the implications of participation, inclusion, partnering, and democratization in the delivery of public services, where the Leviathan State is relentlessly hollowed out at the bottom level (because of networks), from the above (due to international interdependence), and from both sides (due to the rise of agencies and professional actors). The rise of such a new perspective in the literature has unleashed an incredible wave of innovation, much of it driven by self-organized local communities. One reason is that Governance has allowed low-cost social communication and organization on a local scale by enabling local communities to out-compete by out-cooperating. This has represented a great value shift in the life of local communities since it has meant a deep structural change in how value is created at the level of each single local community by the sole intertwining of trust, people, and networks.

The greatest innovation that Governance has brought in is the emergence of practices of collective action being more effective and decentralized since not relying on a managerial structure for coordination. In this system of citizens-based peer production and open platforms, government has suddenly become unnecessary to create something that has great value. In fact, social organizations within local communities have progressively been driven to a shift not only in terms of organizational behavior, but also in the very definition of wealth and public value.

## Theoretical Frames

Existing theories and approaches to Governance that nurture the literature today are so abundant that create problems for those looking for a clear and simple definition. Nevertheless, it should be noted that there is a common denominator in the understanding of Governance, which refers to the setting, application, and enforcement of rules (Kjaer 2004). Kjaer suggests that Governance has a twofold focus: the first is the input side that is concerned with democratic procedures; the second refers to the output side, which deals with efficient and effective institutions.

In general terms, it could be argued that Governance, if read through the lens of the ***New Public Governance*** perspective (NPG), starts when the Government abandons its role as provider of leadership that is believed necessary for governing. Hence, the State, or better the Government, in its transformed role, plays a decisive role in influencing all the actors engaged in the decision-making process. The centrality of the State still remains as firm but its public performing role becomes a key factor of Governance since the State stands as the guarantor of collective interests.

This story tells about the decline of the rational goal's logic advocated by Taylor (1911) and Weber (1924) in favor of the rise of an open system's logic represented by the metaphor of networks emphasizing the theme of opportunism as well as plural and utilitarian partnership-based policies. The NPG model, in order to perform efficaciously, upholds not only trust but also democratic and self-governance mechanisms as well as bureaucratic procedures. Some authors such as Wiseman (2005) contended that the shift from thinking through the government's lens to multi-level governance has also implied a change of emphasis, in the policymaking, from economic priorities to social values while respecting the

concept of integrity and interdependence. In fact, as Rhodes argued, trust, reciprocity, and collaboration are all Governance needs since it involves government plus the looser processes of influencing and negotiating with a range of public and private sector agencies to achieve mutual and desired outcomes (Hambleton 2004: 50). In addition, the face of the local government changes and becomes as an enabler rather than a mere provider of services.

Whereas the NPG model mainly relies on a reformist and innovative bottom-up approach to developing communities, through popular participation and engagement of different stakeholders setting up self-governing and interdependent networks, it produces effective and efficacious results if applied to the local dimension. The NPG, embodying the core values of a local community such as participation, inclusiveness, fairness, and accountability, seeks to combine those with production, consumption, and governance into an integrated paradigm of change that shifts towards ***Local Governance (LG)***.

Emphasizing on interactions between civil society and government in determining bottom-up policy making, strengthening local accountability and responsiveness of government to citizens, as Rhodes (2000) argued, LG expresses itself in a socially and culturally defined local context where the knowledge produced is collective and shared. The implication of adopting the tripartite model of trust, reciprocity, and collaboration not only sparks off a serious intellectual framework and discourse that validate human cooperation within the community. More importantly, it prompts an interest in setting in place different mechanisms leading to an organization based on the community which becomes self-sufficient, self-reliant, and sustainable (Clarke and Stewart 1999).

To continue this reasoning in the perspective of LG, the greatest innovation that Governance has brought in is the emergence of a decentralized and more effective collective action. LG, therefore, becomes a very different value proposition: one that is dedicated to generating indivisible, socially embedded common wealth and public value. Such a phenomenon, which has reached its fullest extent in the realms of the locale, implies collaborative and nonproprietary systems, which are based on sharing resources and outputs among widely distributed, loosely connected individuals who cooperate with each other. In this system of citizens-based peer production and open network platforms, government becomes unnecessary to create something that has great value. In fact, social organizations within local communities are forcing a shift not only in organizational behavior, but also in the very definition of wealth and public value. Through citizen participation at the local level, LG is able to generate a public value that is a socially created value because it is shared, evolving, and accessible to everyone. Such a socially created value, although it has always existed, has not ever been culturally legible or consequential. In its broad sweep, LG offers a powerful way to reconceptualize governance, economics, and policy by attempting to revitalize democratic practice at a time when conventional political institutions are dysfunctional, corrupt, resistant to reform, or all three.

This approach emphasizes on the well-being of local community rather than on an encouraging efficiency through customer-oriented service delivery (Taylor 2000). As Stoker pointed out (2007), this approach merely has encouraged the redefinition of local government's role while offering a broader vision of local governance as based on *networked governance*.

As Stoker emphasized, a networked community that is positioned in the realm of local governance is able to offer solutions to complex service and policy issues that presuppose an active intervention of the community. All this bearing in mind that people have rights to: "*respect of themselves, a quality of life, decent public services and the opportunity to influence their environment, and about responsibilities to respect others, make a contribution to supporting their environment and their fellow citizens and engaging in and accepting as legitimate the outcomes of the* democratic process" (Stoker 2005: 7).

It would be important to put forward the underlying key concepts of LG paradigm that would explain, in theory, practices and mechanisms of governing communities: ***new localism,***

***community engagement, community empowerment***. Starting from the concept of ***new localism***, it draws on the theory of devolution and was conceived, as Stoker has argued (2005: 2), as a strategy aimed at devolving powers, resources, and structures away from central power of control towards local democratic communities within an agreed framework of national minimum standards and policy priorities. Such a new localist policy could be assumingly viewed as a response to the complexity of modern governance to the extent that it calls for a more engaging form of democracy while enabling the dimensions of trust, empathy, and social capital. In other words, decentralization is not primarily about the passing down of responsibilities from the central government to the local one but it involves a parallel, and more substantial, process of passing power to communities, neighborhoods, and citizens. The focus of new localism, as an approach, has shifted from governing organizations to governing communities (Clarke and Stewart 1999). The increased emphasis on community governance, that – by definition – is concerned with networks, and so a key theoretical attribute is collaborative relationships and partnerships between organizations, can be explained as a response to diminished citizenship created by the new public management approach and the growth of managerialism. The move to reinvigorate notions of civil society, citizenship, and democracy were linked to concerns that existing models of government were inadequate (Gaventa 2006; Denhart 2007). It is also reflected in the influence of leading political scientists such as Robert Putnam (1993) who wrote about social capital and importance of a "civic community" if a democracy is to work.

This has also meant a change in giving priorities: from an emphasis on prescribed number of services as a traditional practice of NPG, to a focus on the well-being of local communities. This approach builds on the practices and experiences coming from New Zealand and United Kingdom that started a process of reforms of local government reform, started in 1996 under the New Labour, originally aimed at encouraging efficiency and customer-oriented service delivery. However, such reform turned to be, as Stoker pointed out (2007), a rethinking and redefinition of local government's role. It led to a broader vision of community governance as networked governance that can apply at all levels of government and focuses on the local/community level.

It is worth pointing out that the local dimension leverages on the principle of subsidiarity whose definition, borrowed by Galligan (1998: 209), refers to wherever possible government functions should be performed by the sphere of government closest to the people. Subsidiarity, as an antidote toward a frequent appeal to state action, reflects the circumstance in which the center interacts with society and there is a significant demand for people and civic participation. At this level, subsidiarity calls for more self-steering in networks, as Kjaer argued when defining the new notions of Governance (2004: 11), so people are encouraged to engage in making their communities better places for themselves and those around them.

In UK, *the new localism* agenda sets the premises for the development of what is called ***neighborhood governance*** (NG) which, at turns, leverages on key challenges analyzed in terms of capacity, competence, diversity, and equity.

Seen as sites for innovation in both governance and service design (Kennett and Forrest 2006; García 2004), neighborhoods are, today, the focus of significant policy attention across Europe as they have now moved onto the mainstream local government agenda. Generally speaking, the neighborhood is portrayed as the place in which local government (and other agencies) can establish new paths for citizen engagement and improved accountability (Pratchett et al. 2006).

To get into the meaning of NG, a definition of neighborhood is fundamental to have an idea of its applicability to governance's aspects. Although there is no ideal definition of it, two ways may help clarifying its conceptualization: the first is merely abstract and refers to a physical space in which a complex interplay between different activities and actions shapes the living conditions for people living therein. The second one is more pragmatic and describes a well-defined physical space which shares some formal recognition in terms of policies, political structures and that is

physically distinct from its surrounding areas. Hence, neighborhood problems are those issues arising from living together in a locally defined and shared space. Engagement with partnerships can also generate vital new resources of social capital for the community. Social capital consisting of trust relationships between a community and its leaders can contribute to the effectiveness of neighborhood regeneration partnerships (Putnam 1993).

Applying the concept of governance in neighborhoods leads to focus on interactions which are captured in the concept of participatory democracy while, at the same time, asking questions about how neighborhood processes relate to formal democratic structures and processes and to what extent residents are involved in shaping the perspectives of the agencies delivering services in the neighborhood.

As Lowndes and Sullivan (2004) advanced, there are four predominant rationales for neighborhood governance: the empowerment of citizens and communities (the civic rationale – that will be dealt with at a later stage in this section); partnership to take a holistic approach to an area (social); government through new forms of representation and participation (political); and management in terms of more effective local service delivery (economic). Initiatives have increasingly stressed the civic rationale in terms of encouraging neighborhood-level ownership of problems and of attempts to resolve these (Lowndes et al. 2006).

Therefore, NG is physically accessible to citizens. And democratic neighborhood governance rests on the idea that residents can make their voice heard in determining the pattern of services delivered to the neighborhood by resolving conflicts, from one hand, among groups of residents and, from the other hand, by using collaboration among residents and professionals as a prerequisite to meeting these two broader aims (Pill and Bailey 2013). Effective NG is very difficult to achieve because conflicts can arise between residents and institutions, through mistrust, misunderstanding, or misguided approaches adopted by institutions. In fact, different forms of conflict are embedded in the diversity of agencies and individuals involved in the neighborhood, each with a different perspective.

As it has been argued, effective NG requires to pay attention to a set of processes (e.g., consultation, co-ordination, mobilization, conflict resolution), but also to formal arrangements (e.g., arenas for information, communication, and decision-making, and the relation between agencies and organizations operating in the neighborhood – Dönitz and Meyer 2004). In some cases, improved NG can be achieved by improving the performance of existing arrangements (processes and structures) in the neighborhood. Alternatively, in other cases, new arrangements that could contribute to improving public services, building community capacity and promoting joint local outcomes and services and making them more responsive to local needs, may be preferable.

The second key concept of LG's paradigm is ***community engagement***. Before analyzing its definition, it would be important to set the word *community* in place. Positioned in the framework of local government, the word raises some extremely complex and difficult issues partly because it is used for very different purposes, and to some other extent because there is no agreed understanding of what a natural community actually is.

There is no agreed definition of community (Chisholm and Dench 2005) since it can be explained in various ways highlighting a number of different characteristics that, in varying degrees, determine the understanding of community (Totikidis et al. 2005). However, in all cases it refers primarily to a group of people living in the same geographic area (Blokland 2003). Questions of what is the community can vary, though, whether the context is a rural or an urban area. In the first case, where clear geographical boundaries and people's understanding of what constitutes their communities are both easily understood, the concept of community may be relatively straightforward. In the second case, instead, the boundaries and the factors, which collectively constitute a sense of community, may both be much less obvious. In urban area, in fact, what it is known is that people establish strong

attachments to their place and seek collective means of influencing or taking decisions about how that place should be managed.

Other definitions would see the term as referring to different communities of interest and identity including ethnic communities, faith communities, the business community, as well as traditional communities of place (Blacher 2005). Some other scholars would agree with the distinction of *relational* communities and *geographical* communities (Rudkin 2003) to the point that the presence of *virtual* communities is also contemplated. From a comparative and institutionalist approach (Bowles and Gintis 2002), a community is described as an entity that, due to the social interactions occurring within its boundaries, is capable of solving problems that both states and markets are ill-equipped to address. In fact, community enjoys not only a great amount of private information that other public actors, including all levels of government, banks, and other formal organizations, do not possess but also the benefit of monitoring itself behavior of its members making them accountable for their actions.

From this standpoint, it could be observed that the definitions above all contribute to approximately explain the pattern of local communities established in the territory of a local authority where, increasingly, the main demand that citizens advance to their local governments is for the right to be involved in place shaping for their community. Uncertainties over what constitutes a community and how to define its boundaries can be very tough when there is a difficulty in understanding the way in which people themselves actually function. Nevertheless, there are some examples of approaches used by some authors (i.e., Stoker 2007 – when presenting the case for a new localism based on community) which simply assume that there is sufficient consensus on the meaning of community. Provided that the concept is of practical application it is needless of a further explanation and precise definition. However, there are some situations where there is a need, because governments of whatever level require legal authority, for a more formal approach.

Having said that, it could be assumed that *Community engagement* has represented, in the whole discourse about Governance, a step forward from the earlier practice of community consultation. Such a shift toward a more refined form of community participation has naturally occurred due to the increasing involvement of a wider range of community actors in public decision-making – both from the perspective of strengthening democracy and protecting public interest (Smyth et al. 2005). The partnership aspect of LG could be viewed as a response to poverty and social exclusion that eventually require new approaches and new methods of community engagement (Geddes 2006) including deliberative democracy techniques that are vital to achieving successful engagement in decision-making. Partnership resulting from active collaboration goes beyond consultation needed for immediate purposes to anchor the need for a pattern of long-term alliances among people from different social and culture backgrounds and their organizations (Brown 2002). Nevertheless, as Aulich (2009) observed after having conducted an investigation in a series of Australian local governments on participatory governance, there are few examples where effective engagement has been established and accepted as a citizen's right whereas the occurred changes to legislation to facilitate engagement within communities did not fulfill the initial expectations. Arguably, at this stage, it would also be valuable to examine the extent to which local governments are building long-term alliances based on a shared governance approach. This will be analyzed in the following paragraph "*Citizens at work. Participation in local communities*."

Nowadays, the term of ***community empowerment*** is the core concept in governance theory. Assuming that, in the modern world, representative democracy on its own is an increasingly inadequate institutional method to achieve democratic accountability, it has been supplemented with more participatory forms in which citizens are empowered to contribute actual governance decisions for their public institutions (Kjaer 2004: 14). Community empowerment originates from the concept of citizen participation viewed as an all-encompassing concept that includes voting, direct democracy, participating in advisory committees,

and deliberating on government's decisions. As it has been argued, input from citizens have resulted in better, more effective governance decisions and have also concurrently helped improve the image of government with citizens (King et al. 1998).

With effective mechanisms of citizen participation in place, public management becomes more dynamic as it responds more proactively to citizen concerns and ultimately is better able to meet the challenges of constantly shifting political and policy environments (Denhardt and Denhardt 2015). Without effective citizen participation, public management often becomes static and fails to recognize and respond to the important political and policy challenges of the day (Leighninger 2012).

By embracing a wider conceptualization of citizen participation in public management, linkages between people's own assets and the democratic dimensions of their participation can be clarified in the conceptualization of community empowerment aimed at solving policy challenges of government. Empowerment builds up on a very clear-cut idea of community, according to the modern literature of Governance, as citizens organized in a group that makes usage of effective bottom-up tools for addressing local communities' needs and that embodies a plethora of formal institutions, interests, and activities to meet the ever-changing conditions. By their very nature, a community as such is oriented to coproduction and, as such, aims at making the most of unused local resources like human, financial, and material ones. There is an emphasis on the unique capability of communities and it is a significant endorsement of the need to engage communities in decision-making over the delivery of important services at the local level.

Having accounted for the definition of community as a precondition for acknowledging *community empowerment*, it could be assumed that the latter refers to a process whereby communities are committed to gaining control over factors and decisions that shape their lives while enabling themselves to gain access and voice, create partnerships, increase their assets, resources, and attributes necessary to gain control.

From a theoretical viewpoint, these newer processes focusing on the evolution in the use of citizen participation in public management shows the significant value of the citizen who is, hence, defined as a collaborator in governance (Thomas 2012). It is arguably a process of building oneself capacities whereas empowerment cannot be adduced by others but it is about people enabling themselves, through the acquisition of more of power's different forms (Laverack and Labonte 2008) in order to become empowered. Power, hence, is a central concept in community empowerment that is more than involvement, participation, or engagement of people (Levine 2007; Putnam 2001; Skocpol 2003). It is about encouraging discussion and debate that result in increased knowledge and awareness and a higher level of critical thinking. It implies community ownership and action that explicitly aim at addressing social, cultural, political, and economic determinants for change. Operating within the arena of a power struggle, community empowerment involves continuous processes of power's renegotiation and status reformulation meaning that it recognizes that if some people are going to be empowered, then others will be sharing their existing power and giving some of it up (Baum 2008).

Community empowerment uses various dimensions of citizen participation in formal and informal networks of governance. What is included in these collaborations are networks of citizens, interest groups, other governments, nonprofit and for-profit organizations where different types of specialties could bring forth the knowledge and implementation power to meet the challenge of a wicked problem (Agranoff 2005). In such a participatory environment, therefore, the role that external agents play in community empowerment is also to be considered as pivotal in catalyzing, facilitating, and accompanying the community in acquiring power. In many ways, the success or failure of twenty-first-century public management rests on the effective citizen participation in governance decisions (Kettl 2002). Moreover, the ability of governments is not merely related to steering people's decisions (Denhardt and Denhardt 2007) but to empowering

individuals and organized groups in enhancing their own sense of agency and making the structural changes to institutions and policies that are needed for realizing their vision of change and development.

## Setting the Framework for Collaborative Working and Community Action

Building on the use of the citizen participation in public management, citizens have been gradually given more opportunities near the end of the twentieth century. Citizens are, hence, the kernel of the truth of the above-mentioned "theories of change" (Sullivan et al. 2002) demanding that for developments to be sustainable they have to be "bottom-up" and emerge from the interaction of the stakeholders with ownership of the process. Along these lines, to strengthen local democracy and advance community well-being, local government needs to find the right blend of community engagement, governance/decision-making processes, and management frameworks.

In order to understand how interdependencies work between them it is important to acknowledge the pattern of their relationships and how they are operationalized in a working model, called as GEM (Governance, Engagement, Organisation), as the figure below explains.

According to the model, **G** stands for **democratic Governance** and it is used to refer to deepening democratic engagement through the participation of citizens in the processes of governance with the government. There is evidence of a strong relationship between governance and democracy which, lying upon a solid ethical basis that generates and maintains a strong foundation of trust between the community and those who govern, is regulated by the legal framework within which local government operates. Democratic Governance, in other words, expresses the leadership that the elected enjoy as well as their decision-making capacity that is based on the commitment to effective community engagement in the political and decision-making process.

The letter **E** stands for **civic Engagement** meaning that local governments struggle to find the necessary and effective techniques to enable active citizens to influence the formulation and implementation of public policies that affect their daily lives. Indeed, if most citizens ignore or actively disregard this dimension of citizen participation, then the future of public management in a democratic society may be in peril. After all, in an ideal democratic society, citizens help to solve community problems (Levine 2013). Moreover, with the power of voting and direct democracy, citizens are informing policymakers of their preferred solutions to existing community problems while concurrently showing their faith in government to solve them. Such commitment from citizens is significantly important whereas administrators rely on direct citizen input to make decisions and solve policy challenges.

Letter **M** stands for **organization Management**. It refers to where public value management policies and practices are embedded in the workplace culture, acknowledge citizen participation rights, and ensure that the outcomes of

community engagement inform decision-making. Organization Management requires mobilizing external stakeholders and communities not just mobilizing internal organizational capacity in the perspective that leadership is redefined and hierarchical approaches are replaced with a collaborative approach towards common goals.

Collaborative approaches to governance, in fact, are becoming increasingly important and widely used for addressing multi-jurisdictional and cross-boundary problems, complex planning, and public policy issues (Margerum and Robinson 2016). Nevertheless, while much literature has focused on case studies of success and best practices for effective collaboration, there has been less interrogation of the challenges to effective collaboration. In fact, contextual, societal, political, institutional and other factors which, ultimately, make successful collaboration difficult are prone to missteps or likely to fail. From this standpoint, in addressing the aspects of collaboration in public management and services, the rising of general barriers to building collaborative partnerships do represent a significant challenge in ensuring a fully enhanced community well-being. In order to overcome those barriers, which are rooted in the practices and cultures of organizations, collaborative capacity is necessarily stringent and, as it has been suggested, it should be developed through five levels: strategic capacity, governance capacity, operational capacity, practice capacity, and community and citizen capacity (Sullivan and Skelcher 2002: 112).

*Strategic capacity* refers to the aptitude of establishing the vision and key themes pertaining to its achievement.

*Governance capacity*, from a network perspective, leverages on issues of dialogue, involvement, and support. It refers, most clearly, to the capability to govern or to intervene in societal processes in order to realize collective goals while ensuring collaborative action between actors on different administrative levels and policy domains. It aims at securing the accountability and establishing means of monitoring performance and the agreed framework within which all actors work. Realizing the necessary governance capacity is a cornerstone for legitimacy.

The notion of *operational capacity* is related to the capacity of conduct activities that will help deliver the vision.

*Practice capacity*, being the capacity for change, refers to the ability and willingness to undertake change. It is an organizational characteristic with potential to foster quality management.

*Citizen capacity*, as a community feature, was popularized in the USA in the late 1990s by researchers from the Civic Capacity and Urban Education Project who studied how local communities tackle the issue of educational reform. This is the capacity of individuals to become active citizens, to work together to solve collective problems, and of communities to encourage such participation in their members. Understood as an individual characteristic, this capacity refers to a citizen's ability and aptitude for participation in the political decision-making process. It is, hence, a property of individuals as well as of communities, such as associations, neighborhoods, cities, or nations, which enables to mobilize their members (both individual and institutional) into collective action. However, it is necessary to point out that levels of civic capacity are dependent on the degree of consensus reached by various agents. Communities with high levels of civic capacity more easily initiate reforms and maintain their consequences. In other words, civic capacity is a key element of social sustainability.

## Participation and Collaboration's Structures: Community Organizations

How do citizens organize themselves in order to ensure participation and deliver collaborative arrangements to solve policy challenges? Is it correct to simply assume that citizens are organized in communities? The answer is yes, but as it has been suggested, citizens have unconsciously built throughout the time what has been formally defined community-based organizations – CBOs

(Dill 2010). These institutional blueprints are considered as governance institutions aimed at improving citizen's abilities to make choices, based on local sociocultural conditions, through open and public discussions and their direct involvement in the design and implementation of programs.

However, CBOs do not exist in a vacuum. Because they are typically organized at the grassroots level and participation tends to be broad-based, CBOs must establish local relationships and partnerships with the local government, agencies, and organizations throughout the public, private, and non-profit sectors (West 2005) as they serve as platforms for identifying and investigating particular issues in more depth, gaining community level information and community impact assessment. Along this perspective, CBOs could be intended as a model of development whereas they are oriented to empower citizens vis-à-vis development at the local level (Evans 2005: 55). Citizens working together and within these realms express their ability to work with the grain of the local sociocultural environment and its endogenous values in order to have an effective impact on institutions. An important question to answer in reviewing the new governance approaches where CBOs function along the operationalized pattern of relationships of the GEM model is how effective it is, from the perspective of those who should ultimately benefit, the citizens.

Participation in local contexts such as neighborhoods can be seen as having several strands that contribute to promoting social inclusion since engagement of people is transversal and inclusive. Participatory activities, because democratic in nature, can be viewed as an action of encouraging social integration that enhance, primarily, the capabilities of actors, and, ultimately, the quality of residents' lives and the better delivery of the most relevant services.

Most of the forms of participation, which are associated with neighborhood governance, are closely entwined with creating, developing, and strengthening networks in neighborhoods: among residents, between residents, professionals, and agencies, and among institutions and civil society (Goss 2005). Looking at building participation and collaboration is a way of seeing the dynamics of network creation, aiming at enhancing the social capital of groups of people, in a more detailed way than is otherwise possible.

However, participation varies from place to place, although there is a widespread commitment to the idea that working with community residents is positive and desirable. It could be argued that the effective engagement at the local/neighborhood level is most likely where there is a tradition of community group activity (Nabatchi 2012). Clearly, this tradition is not present in every community within the neighborhood. Where it is not, resources need to be geared initially to capacity building in order to develop these strong foundations. This adds to the resource commitment required to make for effective community or neighborhood working. As observed, capacity building is complementary to community and neighborhood governance approach (Sullivan 2008), more specifically in the way in which it supports development and learning, contributing to the management of change within organizations and communities.

There are many different forms of neighborhood arrangements carrying out different functions and tackling different issues. The forms, functions, and issues in a particular area change over time, as the local situation changes, and the environment in which they operate evolves. In all cases, participation reflects the relationships among individuals themselves and the social dynamics occurring between formal/informal infrastructures and resident citizens in the community or neighborhood. Social relationships among citizens develop according to axes of social differentiations such as ethnicity, gender, age, kinship relationships, and occupational status. These are relevant because they create proximate links with individuals belonging to the same group and encourage motivations for engaging in capacity building activities to help individuals improve their own circumstances. What is crucial to know is that in order to reach all groups, information and knowledge about the day-to-day aspects of social groups is fundamental. Diffusing knowledge about different organized social groups is a key first step in bridging the social

divisions which social differentiation can engender.

The importance of working, at the spatial level of the community or neighborhood, in the pursuit of securing sustainable improvements in public services through the engagement of citizens with government's institutions requires compliance to those critical success factors for effective community working. These reflect the intertwining of five broad principles that lead to the achievement of an effective and sustainable community participation:

1. Information
2. Consultative – management at the community level
3. Responsible accountability – representative forms offering opportunities for citizen engagement
4. Collective choice – community capacity for engagement
5. Service control – that is capacity and commitment in the wider governance arrangements to build community engagement into their decision-making

These principles give plenty of scope for neighborhood arrangements along the spectrum of responsibility (see figure below) and any consideration of those must be in the context of both of this spectrum and an understanding of what is meant by a neighborhood.

The figure also indicates that where arrangements appear to be based on strong responsibility so that to ensure the empowerment to service control service delivery, the efforts are evidently oriented towards local regeneration and renewal, which mainly occurs in urban areas. This suggests the need for concerted efforts to improve links between neighborhood and authority-wide governance arrangements.

However, at the basis of all, the information diffusion is that powerful to spark off actions towards community gathering and engagement. For residents, communication plays an irreplaceable role in diffusing information and making it socially accessible: ethnicity, language, and approachability are key characteristics for workers in them. Oral communication also diffuses through social networks, so discovering or creating and linking the widest possible range of networks, activities, and groups are important elements in strategies for information diffusion (Skelcher et al. 1996).

Provided the necessary information, the element of consultation becomes pivotal in supporting people about reflecting on their situation, articulating their ideas and opinions, and discussing them. As argued, this is a precondition for building both individual and collective capacities. However, consultation does not always have to be top-down. It can also be horizontal, neighborhood groups consulting other neighborhood groups (Gallop 2007).

The immediate step forward consultation is empowerment that has a twofold meaning. Firstly, it means ensuring that people can act because of their understanding of the issues occurring in the context where they live; secondly, it refers to the fact that people have the skills and tools to act in an institutional context within which they can act. Such institutional contexts can form small groups through to larger organizations and large, formal situations. However, what is important is that empowerment is a learnt behavior and it needs to be practiced within relatively secure environments.

To conclude, significant range of benefits can be achieved from neighborhood working both in terms of service improvement and engaging citizens but what remains important is that local areas do need the space to develop their own arrangements and that one size does not and cannot fit all areas. In all cases, provided all actors engaged are clear about the functions to be carried out in their own community, appropriate forms can be developed to take the agenda forward and could also involve interventions to change traditional approaches.

## Conclusions

Opportunities for citizens to engage in policymaking and delivery have increased considerably over recent years. Various aspects of community working and governance need to be taken into account in the design and delivery of policy interventions and practices to meet community challenges. Nevertheless, good governance is founded on good engagement. With proper Governance, which becomes a very different value proposition – one that is dedicated to generating indivisible, socially embedded common wealth and public value, citizens become highly generative. This could be viewed as a serious innovation, not innovation as a brand new technology or product. Rather, it is innovation as a socioeconomic management paradigm of generating value.

As a new way of generating value, it accomplishes useful things outside the government, such as the ability to manage shared resources, participation, and inclusion, in order to rebuild a social fabric that neither the Market nor the State have been capable of rebuilding. At a time when the old structures and narratives simply were not working, the community gives a reason to be hopeful for development. The particular Governance structures for generating value differ from one community to another. Yet, what all communities have in common is an ability to manage shared resources, participation, and inclusion. Governance, read though the lenses of a local empowered community or neighborhood, stands as a kind of policy platform that can interconnect with other communities and begin to scale. If neighborhood working is to be effective in securing sustainable improvements in public services and re-engaging citizens with the institutions of government, it must reach the range of communities that exist locally and engage with them in ways that recognize their different needs, capacities, and interests.

At its core, community-based models challenge and transform democratic institutions. In the framework of Local Governance, community-based organizations amounts to a new social organism and metabolism, as new species of governance they decentralize power and invite citizens to participate and contribute with their creativity on a decentralized, horizontal scale. LG, therefore, demonstrates that societies can actually leverage cooperation and bottom-up energies to solve problems, and it points to new modes of governance beyond, or in constructive partnership with, representative democracy.

From this standpoint, there is the assumption that LG produces innovation in what could be defined as "the vernacular domain" (Illich 1983) that is the space in people's life in which they can create, shape, and negotiate their lives. The created innovation, although as small and marginal because referring to a local scale, is meant to translate into sustainably real local models which would eventually scale to larger sizes depending upon the type of resource and social coordination found possible within the locality.

As a system of governance, common-based initiatives that start from the local community offer several critical capacities. These include the ability: to empower people to take charge of the resources they need; to reduce inequality and

insecurity and seek self-sufficiency; to reconnect people to each other and to the local sociocultural environment; to provide a new framework for development, opening up interesting new possibilities and synergies.

# Governing and Managing International and Global Nonprofit Organizations

Barry D. Friedman
University of North Georgia, Dahlonega, GA, USA

## Synonyms

Leadership and operation of international nonprofit organizations (INGOs)

## Definition

Needs for and approaches to organized global activity to address resource inequity, threats to the environment, animal abuse, warfare and other violence, criminal activity, natural disasters, famines, epidemics, human-rights violations, and other causes of suffering.

## Introduction

Around the world, and especially in developing countries, there are innumerable individuals who are suffering because of poverty, illness, natural disasters, and warfare and other sources of violence, among other sources of misery. Other individuals – especially sympathetic people in developed countries – have established international nongovernment organizations (INGOs) to

move resources to areas where suffering abounds, to marshal world opinion, and to lobby governments and international government organizations for resources and reform. Various circumstances determine how activists structure their INGOs and how they distribute influence among leaders, professionals, other employees, volunteers, and other members of the organizations.

## Rationale of Multinational Activity

While the borders that separate nations have towering political significance, there are any number of human behaviors and natural phenomena whose effects migrate across those borders. Droughts, famines, storms, earthquakes, pollution, business-cycle fluctuations, criminal conspiracies, ideological and religious movements, terrorist bands, and warfare frequently cross national borders and affect populations of multiple nations. The interactions of national governments through international relations, including discussions under the auspices of such international governmental organizations (IGOs) as the United Nations, are often insufficient to resolve such mobile challenges. Indeed, it is not unusual for national governments to lack the resources or, perhaps, the incentive to address the suffering of their own respective populations and of neighboring societies.

Multinational corporations may carve out a role in the alleviation of some of these problems. But such private-sector, for-profit entities answer to their shareholders and are loath to commit more resources than their financial conditions can withstand. The remaining difficulties capture the attention of the nonprofit segment of the private sector.

Nongovernment organizations in the nineteenth and early twentieth centuries focused on efforts to mitigate and eradicate disease, especially in impoverished societies, and on efforts to prevent or alleviate the suffering associated with warfare. Christian missionary roles (originating in the sixteenth century) expanded to encompass the delivery of medical services and medications. On the secular side, the Geneva-based International Committee of the Red Cross fostered diplomatic proceedings that developed guidelines to delegitimatize warfare strategies that obstructed the efforts of medical services to treat wounded soldiers and civilians and that caused needless suffering for prisoners of war and civilian populations – hence, the Geneva Conventions.

Since the 1970s, the modern theme of international nongovernment organizations (INGOs) can be described, in general terms, as the efforts of Northern-hemisphere activists to improve the quality of Southern-hemisphere life. While INGOs have a long history of providing disaster and famine relief, which they continue to do, these organizations have undertaken new tasks which include "roles centered around economic and social development; political roles such as advocacy (including lobbying), agenda setting, and public education; monitoring of international agreements; and interacting with intergovernmental organizations . . ." (Ahmed and Potter 2006, p. 37). These new functions have elevated the nonprofit voluntary sector to a higher level of influence in international politics.

A vast assortment of INGOs has arisen to come to the aid of the world's most unfortunate inhabitants (human and otherwise) and, indeed, of the earth itself. Accordingly, CARE addresses the worldwide problem of poverty, the International Committee of the Red Cross reduces some of the suffering caused by warfare, Medécins Sans Frontiéres (Doctors Without Borders) sends medical resources into places in which illnesses and injuries abound, Amnesty International advocates human rights and exposes cases in which governments hold political prisoners in captivity, the Humane Society International battles mistreatment of animals and preaches for humanitarianism, and Greenpeace intervenes when the earth's ecosystems are being despoiled.

The unmistakably political emphasis of the modern nongovernmental organizations has prominent effects on international relations, the global economy, and the operations of national governments. There are a number of noteworthy aspects of this political machinery. Nongovernment organizations, for example, expose the neglect of the poorest populations. "In the parlance of current scholarship, [INGOs] engage in naming, framing, blaming, and shaming" (Ahmed and Potter 2006, p. 37). This frustrates

the desire of many national governments to conceal the plight of their lowest socioeconomic classes. In addition, nongovernmental organizations actively advocate for disadvantaged populations and lobby governments and international (government-sponsored) organizations. Furthermore, INGOs network and, through their information channels, disseminate data and commentary about problems that they want resolved. In so doing, these organizations pressure governments to live up to the commitments – concerning matters of equity and justice – to which those governments have previously committed themselves. They also engage in "public education and consciousness raising." As Ahmed and Potter write, "[INGO] mandates cover a broad spectrum and usually include outreach activities to educate local, national, or international governments and institutions. Indeed, [INGOs'] most important work may lie in the area of political socialization" (Ahmed and Potter 2006, p. 46).

While INGOs raise funds from governments, for-profit firms, foundations, and individuals and thus transfer resources to places where dire need exists, they also perceive a pressing need to focus attention on worldwide problems, inspire others to become activists, and influence government policies. Therefore, they carry out the functions of knowledge, networking, and advocacy. As a matter of practicality and necessity, INGOs have routinely banded together into coalitions. They have been aided by modern communication technologies that facilitate networking. Examples of such coalitions are the Jubilee 2000 campaign for debt relief, the Coalition for an International Criminal Court, the Coalition Against Landmines, the International Human Rights Network that addresses trafficking of sex workers, the Rainforest Action Network, and the Maternal and Child Health Movement. They are now instrumental in allowing the nonprofit sector to make an impact on daunting worldwide adversities. "... [I]ssues like human rights, women's rights, and environmental protection that have dominated UN meetings/platforms did so mostly because of the active role of influential [INGOs]" (Ahmed and Potter 2006, p. 82). Accordingly, national governments, IGOs, and multinational corporations find that their freedom to maneuver as they please may be constricted by the agitation of INGOs that spotlight ruthless or insensitive policies and behaviors. In multiple contexts, INGOs and their activities have become a noteworthy independent variable in the determination of what governments do and how they do it.

## Economic Rationale of INGO Activity

Some of the principles of economics help to explain why INGOs have the opportunity to serve the public because government agencies and for-profit firms pass on providing certain goods and services to the public or actually generate the need for the goods and services.

As public-choice theory suggests, government officials act rationally to serve their self-interests. In 1975, economist Burton A. Weisbrod explained that public officials find it expedient to provide a level of service that will satisfy the typical voter. As a result, those citizens whose need exceeds that of the typical voter remain underserved. This circumstance can be labeled as discrimination against disadvantaged minority groups. The underserved citizens will look elsewhere to obtain the additional units of service that they need. If the nonprofit sector is willing to compensate for the government's insufficient service provision, it has a basis for soliciting donors to help make up the difference.

Nonprofit organizations also have a role because of externalities. Externalities may occur when there is a transaction between two parties. In the free marketplace, many such transactions take place and, in theory, all of them produce net benefits to the parties directly involved because, in the absence of such benefits, the parties would not consummate the transactions. But the free market is not perfect, and uninvolved bystanders might be affected by side-effects of those transactions.

Externalities may be positive or negative. When there are positive externalities, third parties may benefit from the transactions that they did not initiate. An example is a local park built by a neighborhood association with voluntary donations. The transactions occur between the association and the donors; if other residents are allowed

to enjoy the park, they benefit – as "free-riders" – from positive externalities. When there are negative externalities, third parties may sustain damage because of the transactions that they did not initiate. Say that, in the aforementioned park, there is a music system that blasts loud recorded music and static as well. Neighbors who are disturbed by the racket, but had no role in the park's creation, thus suffer from negative externalities.

Some kinds of positive externalities are labeled as "public goods." Governments provide some public goods – such as parks, law enforcement, and environmental protection – because of a consensus that all citizens should contribute to their cost on the basis that all benefit. When the government is hesitant to supply public goods or is willing to supply less than the number of units needed, a need for the nonprofit sector to serve the unfilled demand may be perceived. Members of unserved or underserved minority groups may clamor for the nonprofit sector to compensate for government's inattention.

The government is considered to have a role in protecting individuals from negative externalities. However, if some citizens feel unprotected, they may reach out to the nonprofit sector and ask that it advocate for their unprotected interests.

Economic theory assumes that the voluntary marketplace transactions occur between parties who possess perfect information, so that they are fully informed about the implications of the transactions. In so far as markets are imperfect, complete information is not necessarily available. In fact, conceivably it is deliberately withheld by either or both parties. Some individuals – such as consumers and donors – may prefer to enter into transactions with nonprofit organizations because those organizations have no owners who anticipate profit and, presumably, no compelling incentive to emit deceptive promotional messages.

## Distribution of Influence Among INGOs' Participants

In the for-profit sector, a proprietorship or partnership is owned and governed by one owner or a small number of owners who direct the employees. The structure of stockholder-owned corporations involves a board of directors that appoints a chief executive who oversees a bureaucracy. Government executive branches are structured as bureaucracies reporting to chief executives. Clearly, what these organizational forms have in common is concentration of policy- and decision-making authority in a small number of individuals, while the role of the vast majority of members is to receive and carry out directions. This occurs even in democratic countries, in which hierarchical organization would seem to contradict the operative principle of equality.

INGOs have a wider variety of structural forms, but researchers have identified some common patterns. Many INGOs originated as membership organizations using democratic rules such as some form of parliamentary procedure so that all members have the same amount of decision-making authority. There are countless factors that cause all organizations – other than those that choose to remain local and small – to reorganize in a way that creates differential levels of influence. Should a US-based INGO wish to obtain recognition from the Internal Revenue Service as a Section 501(c) (3) organization or become required to seek such recognition because its large amount of revenue necessitates it, it must devise an articles-of-incorporation document that prescribes the periodic appointment or election of a board of directors that has governing authority. Other pressures that cause INGOs to depart from democratic decision-making are these:

- The most influential members of the organization may persuade the other members that accomplishment of its mission requires a board populated by experts, such as an accountant, a banker, a lawyer, a public-relations expert, an experienced fund-raiser, a practitioner licensed in a field relevant to the INGO, an accomplished manager of another INGO, and so forth.
- The most influential members of the organization may persuade the other members that accomplishment of its mission requires that it reorganize along the lines of corporate,

managerialistic forms that include a professional staff.

- As the small organization successfully attracts attention, expansion may be a logical next step. The expansion may involve, for example, the creation of chapters or national affiliates in other nations in which donations can be solicited and the opening of field offices in countries where the organization now feels capable of delivering services directly. The expansion may require an end to decision-making by as many members who can assemble in one room because the membership is scattered nationwide or worldwide.
- The organization may opt to make contracts with one or more governments to deliver public services desired by, among others, the organization's own members. The members may agree to the creation of a governing board whose members include officials of those governments along with practitioners and experts in the organization's field.

Those and other kinds of reorganization will reduce or even eliminate the influence of most individual members, detaching them from the decision-making process. Thereinafter, when a member seeks to renew her membership and pay her dues, she may receive a membership card that is a receipt for the donation and otherwise has no significance in terms of influencing the organization's procedures. In some organizations, individual members may have a vote when board members are elected. In many large organizations, the boards reelect or reappoint themselves at specified intervals. Indeed, many INGO entrepreneurs found their organizations by placing relatives and friends on the governing boards, excluding subsequent members and donors from decision-making at the outset.

INGOs that set up national affiliates must settle on procedures for voting and other mechanisms of policymaking. Decision-making at the INGO's international level will likely involve representatives of the national affiliates. A variety of approaches is used. Each national affiliate may have one vote or the same number of votes in the international organization's "house of delegates." Alternatively, the votes may be distributed by taking into account the various nations' numbers of members or their production of fundraising proceeds. Within the national chapters or affiliates, voting may be democratic – either on actual resolutions or in elections of board members. In most of Greenpeace's national branches, Anheier (2014, p. 479) reported, members do not vote: The board of Greenpeace US appoints and reelects itself while other members have no influence in determining who will govern the US branch. Members of Greenpeace Spain elect some of the members of the branch's General Assembly. These differences arise because of variations in historical experience and national laws.

The tendency of INGOs to abandon any democratic processes with which they may have started out raises the concern of many observers about their susceptibility to elite control. Oligarchical approaches deprive individuals – including active field volunteers – of the opportunity to develop skills in such categories as advocacy, organizing, and capacity building. It is troubling to some to contemplate that donors, who make the organization's work possible, have no input into the organization's policies. Another concern is that members of the neediest elements of the population and their representatives may have no voice in influencing how the organization's service delivery is carried out, notwithstanding that they have by far the largest stake in what the INGO does. *Their* disenfranchisement raises the most serious questions about INGOs' preference for top-down policymaking and policy execution.

## Role of Professionals

### INGOs Experience Pressure for Professionalizing

Voluntary nonprofit organizations routinely experience pressure to be more "professional." In the United States, the Internal Revenue Service requires meticulous recordkeeping and reporting that all-volunteer organizations can find difficult to perform to the IRS's satisfaction. Governments, foundations, and businesses that offer grants to nonprofit organizations may require a

professional staff that is skilled in such processes as sophisticated program evaluation. Researchers, professors, and managers who focus on the nonprofit sector may advocate for nonprofit professionalism. There is not much of a faction that advocates persistently for democratic, volunteer-driven structures in the nonprofit sector. But those who stand to benefit from professionalism are numerous, powerful, and persuasive.

### Professionalism Is a Concept Imported from the Business Sector

The amount of research and publishing devoted to business-sector management and organization swamps the amount devoted to nonprofit leadership. Nonprofit organizations have been influenced by for-profit management concepts, such as management by objectives (MBO), that became popular in the 1970s and strategic planning in the 1990s. Several researchers document how INGOs are becoming more "business-like" (Lewis 2014; Stroup 2012).

### Professionalism May Take Away from the Uniqueness of the Nonprofit Sector

In so far as the rationale for the creation of nonprofit organizations is that they fill gaps in societal needs not suitably addressed by government agencies and business corporations, the effort to cause nonprofits to act like the organizations of the first and second sectors of the economy may seem misguided. The public's interests might more effectively be served were INGOs to be flexible and free of rigid bureaucracy. Professionalism can suppress experimentation, outside-the-box thinking, and challenges to establishment policies (Stroup 2012). Another matter is that the organizational theories underlying the drive for professionalism reflect Western approaches to business administration and may actually interfere with INGOs' service delivery in places like central and southern Africa.

### Professionalism Has Inherent Costs

Professionalism's elephant in the room is its inherent costs. The existence of such theories as Parkinson's Law and the Peter Principle should, perhaps, set off alarm bells about the adoption of bureaucratic structure. Hiring experienced professionals can drive up the budget for salaries. Bureaucracy is associated with such practices as red tape, paperwork, pass-the-buck avoidance of responsibility, and redundancy and duplication. Tina Wallace, Lisa Bornstein, and Jennifer Chapman wrote, "Many staff in both north and south complained that they felt more like bureaucratic aid administrators than development workers and that more time was spent on paperwork than development" (quoted in Lewis 2014, p. 236).

### Businesses Are Slowly Adopting Participatory Management

Lewis (2014) has reported that some businesses have been incorporating participatory management. Participatory management is a "novel" idea proposed *a century ago* by the visionary organizational theorist Mary Parker Follett. Barbara Parker wrote, "In a rapidly changing global world where flexibility is a critical variable, resources are less than abundant, and learning and thinking at all levels have become important, lower level employees also have become involved in all aspects of organizational change and development" (quoted in Lewis 2014, p. 223). Lewis (2014, p. 223) adds, "Most up-to-date management thinking now stresses many of the characteristics associated with the ideal type of third sector management – open systems thinking, flexibility, reduced hierarchy and decentralized structures." He observes that many businesses are now involving employees in decision-making, while, curiously, many INGOs continue to practice obsolete top-down management practices.

If the nonprofit sector were to abandon participation – the central logic of voluntarism – just as some businesses are recognizing its value, the loss of truly collective thinking and problem-solving could be a most unfortunate development for global civil society.

## Perspectives of Institutional Theory

Institutional theorists state that an organization has become an institution when it has developed its own system of norms, mores, traditions, and

customs. By the time a small nonprofit organization has expanded into a full-fledged INGO, it has certainly developed such a system of "organizational culture." The members of an institution know what are considered appropriate processes and conduct, what processes and conduct attract disapproval, and how to structure messages that conform to the organization's culture.

Organizational theorist Charles Handy identified four organizational-culture styles:

- In a *power culture*, a leader is the focal point of the organization. How members of the organization should act is defined by the leader's cues, so that roles and rules are de-emphasized.
- In a *role culture*, the organization has a bureaucratic structure that establishes roles from which, in accordance with role theory, members derive guidance about how to behave.
- In a *task culture*, there is expert power that empowers experts to signal what actions and conducts are acceptable.
- In a *person culture*, the purpose of the organization is to serve the interests of the members who work in it. Decisions are made by mutual consent. Handy said that many nonprofit organizations operate with this culture (cited in Lewis 2014).

Alongside the institutional-theory research that explains how organizations develop distinctive culture, there is institutional-theory research that describes *isomorphism*: the phenomenon that causes organizations to imitate each other's cultures. Stroup (2012, p. 7) wrote, "We can identify at least three paths by which INGOs worldwide might converge upon shared norms and practices – exposure to the same world culture, reliance on the same financial resources, and work on the same problems. . . ."

Anheier (2014) says that, in terms of INGOs' internal structures, "forms cluster around various models of federations, a version of the multidivisional form. . . . Together, federations and network structures seem to emerge as signature elements of organized global civil society" (p. 479). Anheier describes other patterns of isomorphism among INGOs:

- A number of INGOs have agreed to voluntary guidelines for self-regulation.
- A "world culture" has arisen that legitimates mainly Western forms of INGO organizing.
- An international professional elite has arisen. Taking cues from their professional training and experience, these individuals develop common cultures and structures in the INGOs that they lead.
- The global funding environment imposes influence on INGOs' cultures and, especially, structures. "Competition [for funding] brings with it calls for reduction of administrative costs, greater professionalization, and flexibility."
- As INGOs increasingly collaborate with other INGOs and government agencies, they experience a "need to create conditions for mutual understanding and language." This need leads to convergence of organizational forms.
- "[T]he high cost of operating globally on limited budgets, combined with a strong competitive environment, encourages mimetic isomorphism as INGOs seek to imitate successful organizations" (Anheier 2014, pp. 483–484).

## Perspectives of Systems Theory

Prior to the 1930s, inquiry in the social sciences was greatly influenced by concern about institutions. For example, political scientists examined in exhausting detail the structures and internal processes of governments' legislative, executive, and judicial branches. Max Weber, a father of sociology, scrutinized governments' executive-branch bureaucracies, describing such features as hierarchy and chain of command, unity of command, division of labor and specialization, the merit basis of decisions about employment, and impersonality of decisions. These orthodox institutionalism approaches reflected very limited recognition of the institutions' interaction with entities outside of the institutions. In the 1930s, social scientists seemed to find those approaches to have run out of steam in their explanatory capacity. Political scientists developed, as

alternatives to the orthodox theoretical approaches, theories centered on a behavioralism theme and, beginning in the 1960s, researchers from across the social sciences embraced the notion of organizations as *open systems*. Open systems theory, commonly referred to as *systems theory*, recognized that the boundary between an organization and its task environment is not impermeable. Rather, the organization influences entities in its task environment and, in turn, those entities influence the organization.

The newly devised systems theory inspired extensive thought about the kinds of influences that an organization's task environment imposes on it, who in the organization are responsible for dealing with the task environment and its influences, and what these individuals do.

The sociologist James D. Thompson memorably described each organization's management as the instrument responsible for managing the environmental pressures. Furthermore, Thompson explained, it is management's role to absorb the pressures, thus buffering the organization's technical core so that the technical core can operate routinely and remain oblivious to the environmental influences.

Anheier (2014) explains that INGOs, operating in the global sphere, encounter a variety of complex task environments in various regions of the world. Business-cycle fluctuations, national tax laws, and other factors can influence prospective donors' motivation and ability to deliver donations to an INGO. The variety of task environments directs varying demands to an INGO, based on how regions of the world interpret the organization's mission. Various national governments enforce laws and regulations appropriate for their respective societies. Also varying from region to region is the level of competition from other INGOs. An INGO's management must decide how to adjust its organizational formats, communications, and service delivery region by region to obtain the resources, visibility, and cooperation that the INGO needs to be successful (Anheier 2014).

Members of the organization whose role it is to manage relationships with the task environment, even if they are not actually managers, can include public-relations specialists, salespeople, employment recruiters, college admissions recruiters, and donation solicitors. One specific role of boundary spanners is surveillance of the environment (see, e.g., Lewis 2014, p. 222), so that the organization is not caught by surprise by societal trends and developments, appearance of new competition, and economic developments, in accordance with this proverb: "There are three kinds of organizations: those that make things happen, those that watch things happen, and those that wonder what happened."

In the nonprofit sector, boards of directors have boundary-spanning responsibilities. Describing understood functions of boards of British charities, organizational psychologist Margaret Harris included the duty of "mediating between organization and environment, representing the organization to outside actors and bringing information and ideas back in from outside" (quoted in Lewis 2014, p. 226). Undoubtedly, a major, *legal* role of nonprofit boards is to ensure that the organizations that they govern are operating in accordance with laws and regulations and to intervene in practices that can call the organization's trustworthiness into question.

## Structure

The structure of nonprofit organizations varies very widely. Consider some of the options for board governance. Some nonprofit boards are *family boards*, which Lewis describes as a small operation in which the members are family-like in terms of relationships based on camaraderie and mutual trust. Some boards are *invisible boards* – a founder places relatives and friends on the board, assuming that they will go along with the founder's preferences. *Staff boards* are populated by the staff members. A common problem is that, over time, there is significant inbreeding of ideas. When *professional boards* are assembled, the members are experienced practitioners and experts (Lewis 2014).

Observers note that, in general terms, there has been an evolution in the structure of nonprofit organizations. The first stage in the evolution was the use of the bureaucratic form. Histories

of nonprofit organizations indicate that a century ago large organizations used the bureaucratic structure. Anheier reports that scholarly associations, the International Chamber of Commerce, the International Federation of Red Cross and Red Crescent Societies, and a variety of political-party alliances adopted the format of bureaucracy (Anheier 2014, p. 477).

In subsequent decades, many nonprofit organizations adjusted their structures. Moving away from hierarchies organized primarily by function – such as production, promotion, and finance –organizations adopted a multidivisional form that was relatively decentralized and allowed parts of the organization to operate with some autonomy. The multidivisional form offered the organizations the benefits of both economies of scale and economies of scope.

A modern structure involves the relational form or network organization. According to Anheier, relational forms balance some of an organization's centralized decision-making process with accommodation of local-level determination of needs specific to the localities. "Relational forms are somewhat 'fluid' organizations that are particularly suited for highly variable organizational environments" (Anheier 2014, p. 476). The placement of authority in employees at local levels allows them to manage the organizations' relationships with the communities that they serve and understand. This arrangement helps an INGO manage a worldwide task environment more effectively than more centralized structures.

Nonprofit organizational theorists recognize the current development of the hybrid/federation structure as the likely future structure of large INGOs. The federation aspect is the existence of a central governing and administrative level. The hybrid aspect is the nature of the organization's semi-autonomous components, which may be commercial enterprises, consulting-service providers, and sheltered workshops.

Anheier (2014) reports an increase in interorganizational cooperation in the form of partnerships, coalitions, networks, and movements. North–South INGO partnerships have proliferated. Partnerships between developed-country INGOs and developing-country INGOs call for the former to focus on advocacy and fundraising in the "North" and the latter to focus on program implementation in the "South" (Anheier 2014, p. 480).

## Effects of National Origin

Although a nonprofit organization founded in a given community may succeed in expanding into an organization of international scope, the INGO can be expected to retain the characteristics of other organizations in the country of origin, Sarah S. Stroup (2012) found. There are conditions and characteristics of a nation that may give an INGO headquartered there a direction. For example, in so far as governments deliver public goods in such a quantity that typical voters are satisfied, according to public-choice theory, a nation's distribution of wealth can determine the size of the disadvantaged socioeconomic class that will be left in need and the volume of its appeals for assistance. The North–South dynamic of INGO activity is well known. But, further, "different patterns of state-society relations create substantial variation in voluntary association membership in developed countries" (Stroup 2012). Having examined INGOs in the United States, Britain, and France, she discovered country-specific patterns of understanding of what charity and activism are about and of what structures and strategies to use. She writes, "... CARE [founded in the United States], Oxfam [Britain], and MSF [Medécins Sans Frontiéres, France] resemble other charities from their home countries more than they do humanitarian relief groups around the world. ... CARE is an American organization first, and only then a relief and development organization" (Stroup 2012, p. 4).

Based on Stroup's observation, she finds national patterns of the three countries.

- *United States*. The US national government is "generous but demanding," and American INGOs work closely and cooperatively with the government. INGOs conduct some "insider lobbying" in the government. But INGOs do not consider themselves to be particularly

political, and they rarely encourage grassroots activity. American INGOs experience a lot of pressure to be demonstrably efficient. Thus, they are "highly professionalized . . . with well-compensated staff." US charities are munificently funded and are larger than British and French INGOs. American INGOs "target their fundraising efforts that offer the most bang for the buck" and control overhead costs.

- *Britain*. The British government is "willing to engage" INGOs and is relatively uninterested in controlling them. In turn, British INGOs are relatively cooperative with the government. The British public is generous to INGOs and is attuned to international affairs. Large INGOs rely on "many modest private donations, consistent with British habits of charitable giving. . . ." While American INGOs limit their advocacy, the British recognize the appropriateness of advocacy and support it: "Oxfam and Amnesty are recognized in their respective fields as worldwide leaders in raising awareness and driving policy change. . . . British INGOs see themselves as part of a broader social movement where individuals work voluntarily to change the society around them." While increasing their numbers of salaried professional staff members, they have maintained their multiple opportunities for members of the public to be involved as volunteers.
- *France*. The French government provides hardly any financial support to French INGOs, and French INGOs reciprocate by relating to the government with "antagonism." Because of France's welfare-state orientation, the public's charitable offerings are minimal. French INGOs have little alternative but to rely on the modest donations that arrive, other than to solicit from the European Union and people in other countries. INGOs offer few policy recommendations, assuming that the government would repel them anyway. Instead, French INGOs concentrate on protest politics. They focus on advocacy and "serve as 'alarm bells' for states, alerting institutional authorities to their failures and demanding that states take responsibility." The protests and advocacy demonstrate how French political activity focuses on the national government's ultimate influence in determining the direction of the state of society. As in Britain, INGOs have hired more salaried staff but maintain and value their volunteer staff (Stroup 2012, pp. 191–193). Stroup concluded that the distinct environment for INGOs in the three countries arises from four dimensions: "the regulatory framework, the political opportunity structure (including both formal and informal opportunities for interaction, the availability of resources, and social networks" (Stroup 2012, p. 18).

G

## Conclusion

National borders can prevent the spread of neither the problems that afflict suffering populations nor the humanitarian impulses of those who wish to alleviate the suffering. There is now a bustling presence of INGOs that are delivering relief to victims of misfortune and that are operating in political circles at the subnational, national, and international level to advocate for victims and to apply pressure for government assistance and policy reform. There is a dynamic international system of nonprofit activity that advocates for the redistribution of resources and that pressures governments and intergovernmental organizations for changes in policy. INGOs vary widely in how democratic or hierarchical they are, how centralized they are, and whether they are professionalized or whether volunteerism is encouraged. As suggested by institutional theory, there is an isomorphic pressure that causes organizations to imitate the structures of the more successful organizations. Also, INGOs reflect the cultures and legal requirements of their countries of origin. Just as there is interest in international government organizations such as the United Nations and the European Union, so is much attention directed at the wide-ranging activity of INGOs and their noteworthy influence on relief efforts, policymaking, and international relations.

## Synonyms

Administration; Bribery; Capital deterioration; Capital erosion; Crime; Development; Public sector

## Definitions

Corruption by definition of Gottschalk (2010) is the abuse of entrusted power for private gain. It can be classified as grand, petty, and political, depending on the amounts of money lost and the sector where it occurs.

Public sector by definition of *Cambridge Dictionary* (2018) is businesses and industries that are owned or controlled by the government.

## Introduction

Different aspects of corruption are always interesting for economists and social scientists. This article addresses the influence of corruption on the capital formation. Corruption is widely perceived to be inversely proportional to growth. This is shown by Mauro (1995) or Mo (2001), whereas Bai et al. (2013) show that the growth can reduce the corruption. Such methods that regard the phenomenon from empirical point of view could be classified as *descriptive*. Despite the fact that descriptive approach leads to interesting results, it is hard to generalize it, i.e., to incorporate several empirical results, which describe different aspects of the phenomenon, in one broader model.

The *normative* approaches to the phenomenon, on the other hand, aim to build a mathematical model for the corruption and could be more promising for policymakers because such frameworks could be broadened iteratively with more and more aspects of the phenomenon taken into consideration. Indeed, there are a number of attempts to provide a generalized model of corruption. For instance, Banerjee et al. (2012) or Bardhan (1997), as well as Mo (2001), proposes different normative frameworks. One of the first agency models was offered in Barro (1973) and was followed by other agency models created by Ackerman (1978) and Becker (1983). The model of Cadot (1987) is applicable to the decision process of a certain bureaucrat but does not allow to spread the obtained results to a macroeconomic level.

This article proposes an approach to corruption in the macroeconomic framework of an aggregate production function that is described in detail in Yamshchikov et al. (2017). In this particular work, only two aspects of corruption are taken into consideration: the percentage of the labor employed in the public sector and a percentage of capital that is "consumed" by corrupt officials. The analysis shows that despite a widespread notion, there seems to be no connection between the size of the government sector and the level of corruption in the country. Using OECD member data, one can even demonstrate an inverse relationship, when countries with "bigger" governments actually enjoy lower levels of corruption. This study proposes an aggregate model that could be used as a baseline to incorporate other aspects of corruption. Under several constraints one can show that there is an optimal level of

government employment that corresponds to the maximum capital intensity in a steady state.

## Government and Corruption: Common Sense and Data

To measure corruption one can consider a "corruption tax" that erodes a certain share of capital on every business cycle. This is a feasible assumption since some of civil servants are connected with corruption scandals that involve offshores or foreign jurisdictions (see, e.g., Christensen 2012); therefore it is safe to say that a certain level of corruption causes an erosion of the capital when a share of it leaves the economy.

Conventional wisdom tends to connect "bigger" government with higher levels of corruption. In particular, one can hear this line of argument from a number of right politicians who, among other ideas, base their campaigns on the general principle that "smaller" government is more effective and less corrupt as a rule. Despite the fact that this assumption seems intuitively correct, it is not so easy to find comprehensive empirical or theoretical studies that could support this statement. This study tries to test this assumption.

In order to do that, it is necessary to obtain data on the sizes of the government sector in different economies and to compare these sizes with the levels of corruption attributed to the corresponding states. The number of workers in public sector in different countries for this study is obtained from International Labour Organization. A direct measurement of a "corruption tax" is far more difficult as any other measurement within a "shadow" economy. Here the Corruption Perception Index (or CPI) is used. CPI is measured on a yearly basis by the Transparency International and is one of the most disseminated measures of corruption among policymakers (see Svensson 2005).

CPI is a debatable measure but has a number of advantages important in the scope of the research question. In general, CPI is higher if a country is less corrupt. This means that CPI is in some sense inversely proportional to the "corruption tax." The question of establishing a quantitative connection between CPI and the "corruption tax" is challenging itself; however the clear qualitative "inverse" connection should be sufficient to test the common wisdom assumption that smaller governments tend to be less corrupt. To do so one can look at CPI across different counties as a function of the percentage of the population employed in the public sector. This overview of CPI as a function of the government "size" can be seen in Fig. 1.

These are data-points on 9 years 1999–2008 across 72 countries (this period satisfies the consistency requirements because calculation method for CPI has been changed several times outside of this period). Two linear regression lines are added for the participants of the OECD (with $R^2 = 0.38$) and for the non-OECD countries ($R^2$ is negligibly small). The CPI is an index that might depend on a number of factors, so it would be naive to expect higher values of $R^2$ in such a simplistic one-parameter approach. Yet the data is illustrative enough to state that despite the conventional wisdom, countries with smaller governments do not enjoy lower levels of corruption (i.e., higher CPI), and the connection between the corruption and the size of the government, if existent, is the opposite. Indeed, OECD countries, which proclaim the reduction of corruption as their strategic initiative, tend to have lower levels of corruption associated with bigger governments and not vice versa, whereas non-OECD members do not demonstrate any significant connection between the size of the government and the levels of corruption. Further in this chapter, a mathematical model that could be based on this interesting notion is developed and discussed. This model associates the inverse connection between the size of the government and the level of corruption and helps to draw several interesting conclusion concerning growth in this framework.

## General Framework

The standard Cobb-Douglas aggregate production function is defined (see Cobb and Douglas 1928) as

$$Y = AL^{1-\alpha}\boldsymbol{K}^{\alpha}, \tag{1}$$

where $Y$ is a final real output, $A$ is a total factor productivity that captures technological progress,

**Government and Corruption in Context of Growth, Fig. 1** Corruption Perception Index and the percentage of labor employed in the public sector. The data-points corresponding to the members of OECD are marked as crosses, and the data-points for the non-OECD countries are circles. The dashed linear regression line corresponds to OECD members, and the solid line corresponds to non-OECD countries

$L$ is a labor input, $K$ is an input of capital, and $0 < \alpha < 1$ is a constant parameter that influences the shape of the production function; it could be as well regarded as a partial elasticity of the output with respect to the capital. It is important to note here that the structure of capital is not in the focus of this paper, so out of three macroeconomic frameworks described by Garrison (2002), it is neither the labor nor capital framework but rather a neutral-money framework. For the sake of simplicity, it is also assumed from now on that $A$ is constant.

Let us now assume that a certain percentage of labor $g$ is employed within the public sector and does not directly contribute to the total production. One can regard $g$ as the labor resources that are "taken" from the market by the government and do not create any additional real output. This means that total labor input is $(1 - g)$ times lower and equals to $(1 - g)L$, where $1 - g$ is a share of workers not employed by the government.

One may further assume that corruption "absorbs" certain share of capital that is denoted as $c$. This coefficient cannot be measured directly, but it is a very typical situation for any quantitative value used to describe a shadow economy. One can understand this factor as the level of "greed" of the corrupt officials or the level of "corruption tax" on the capital. Though this variable lacks direct measurability, it is standard for corruption models. Corruption lowers the total capital input $(1 - c)$ times and makes it equal to $(1 - c)K$, where $1 - c$ is a share of capital available for the economy after the "corruption tax." There are a considerable number of papers that show the outflow of the corrupt capitals offshore; see Hampton (1996).

Now, in presence of these two factors, Eq. (1) looks as follows:

$$Y = A(1-g)^{1-\alpha}(1-c)^{\alpha}L^{1-\alpha}\boldsymbol{K}^{\alpha}. \quad (2)$$

Out of (2), one obtains a connection between a capital intensity $k_{\text{solow}}$ from the model proposed by Solow (1957), i.e., the capital stock per unit of effective labor, and a capital intensity for model, adjusted to the effect of corruption that will be denoted as $k_{\text{corrupt}}$:

$$k_{\text{corrupt}} = (1-g)^{\frac{1-\alpha}{\alpha}}(1-c)k_{\text{solow}}. \quad (3)$$

Since it is assumed that $g$ and $c$ are time-independent, the same adjustment would hold for a steady state in Solow model, which means that:

$$k^*_{\text{corrupt}} = (1-g)^{\frac{1-\alpha}{\alpha}}(1-c)k^*_{\text{solow}} \quad (4)$$

where $k^*_{\text{corrupt}}$ denotes the steady-state value. Further reasoning in this article will be based on Eq. (3).

## Corruption and Government Employment

Let us now closely look on the coefficients of (3) that depend on $g$ and $c$. Let us assume that $c = c(g)$, meaning that the level of "greed" of corrupt officials can depend on the size of the government.

Let us take a partial derivative of $k_{\text{corrupt}}$ with respect to $g$ and keep in mind that $c = c(g)$:

$$\frac{\partial k_{\text{corrupt}}}{\partial g} = \left(-(1-g)^{\frac{1-\alpha}{\alpha}}\frac{\partial c}{\partial g} - \frac{1-\alpha}{\alpha}(1-g)^{\frac{1-\alpha}{\alpha}-1}(1-c)\right)k_{\text{solow}}. \quad (5)$$

If there is an optimal value of $g$ such that $k_{\text{corrupt}}$ (i.e., capital intensity in presence of corruption) is maximal, that means that in this point $g_{\text{optimal}} = g_0$ the first derivative of capital intensity with respect to $g$ is equal to zero, and the second derivative with respect to $g$ is negative. The condition $\frac{\partial k_{\text{corrupt}}(g_0)}{\partial g} = 0$ essentially means that:

$$-(1-g)^{\frac{1-\alpha}{\alpha}}\frac{\partial c}{\partial g} - \frac{1-\alpha}{\alpha}(1-g)^{\frac{1-\alpha}{\alpha}-1}(1-c) = 0, \quad (6)$$

or writing it in another way:

$$\frac{\partial c}{\partial g} = -\frac{1-\alpha}{\alpha}\frac{1-c}{1-g}. \quad (7)$$

that is always not positive because $\alpha$, $c$, and $g$ are less than one by definition. In our framework $c = c(g)$, so Eq. (6) is actually an ordinary differential equation and can be solved keeping in mind that $\frac{\partial c}{\partial g} < 0$. One can find a more detailed solution in Yamshchikov et al. (2017). The solution of this equation in terms of $g$ is:

$$g_0 = 1 - \sqrt{\beta(1-\alpha)}. \quad (8)$$

where $\beta$ is an arbitrary constant. The found $g_0$ maximizes $k_{\text{corrupt}}$.

## Discussion of the Model

A simple model proposed above has four interesting implications.

The first one is that there is an optimal "size" of the government that provides the biggest capital intensity in Eq. (8). This size is bigger for capital-intensive countries and smaller for labor-intensive ones.

The second implication is following from the formula (6). At least in the neighborhood of the optimum point $g_0$ (obviously, the model cannot handle extreme cases, when $g$ is too close to 1 or to 0), a bigger government leads to a smaller corruption "tax." If one thinks in the framework of institutions rather than of individuals, then it can be explained by the competition within government structures; this competition might lead to the reduction of total level of corruption.

**Government and Corruption in Context of Growth, Fig. 2** The model for a dependence of the steady-state capital intensity k∗ on the side of the government g for a labor-intensive country (to the left, $\alpha = 0.4$) and a capital-intensive one (to the right, $\alpha = 0.6$)

The third implication directly follows from the second one. Since $c$ cannot be measured directly and around the optimal state $\frac{\partial c}{\partial g} < 0$, there is always a temptation to increase the size of the government that in return can actually reduce corruption but will be suboptimal for the output of the economy and a personal capital intensity.

The last and arguably the most interesting implication directly follows from Eq. (4). The negative effect of the government that differs from an optimal one ($g \neq g_0$) tends to be stronger for a labor-intensive country (see Fig. 2). This is due to the fact that the level of corruption "tax" has a linear influence on the capital intensity, while the level of government employment influences it nonlinearly, and the influence of $g$ grows drastically as $\alpha$ gets smaller. This also means that capital-intensive economies might fight corruption at the expense of the growth, whereas labor-intensive ones cannot afford this luxury.

## Conclusion

This study empirically demonstrates that a widely disseminated notion that countries with smaller governments tend to have smaller levels of corruption does not have a solid empirical background. In fact, according to the provided data, for 72 countries the connection, if existent, is the opposite.

A broadened framework of an aggregate production function is used to describe a relation between the employment in the government sector and the level of corruption "tax." Assuming that there is a connection between the corruption tax and the size of the government, it demonstrates an existence of optimal size of the government that corresponds to the highest capital intensity of the economy.

The model combines mathematical and economic simplicity with a possibility to describe certain phenomena associated with corruption. In particular it shows that to enjoy higher capital intensity, labor-intensive countries should have lower percentage of labor employed in the public sector in comparison to capital-intensive ones. The model also shows that it is crucial for a labor-intensive country to have a size of the government that would be close to the optimal size, since the capital intensity decreases steeply if the government size differs from the optimal one. For the capital-intensive countries, this aspect is, however, far less important, and suboptimal size of the government that can be too big or too small would still correspond to a comparable capital intensity. Finally, due to the simplicity and generality of the model, it can be used as an integrating framework that can help to take a phenomena associated with

corruption and the size of the government into consideration within more complicated multifactor models.

# Government and Nonprofit Relationships

Nick Juliano
University of Nebraska Omaha, Omaha, NE, USA

G

## Synonyms

Civil society; Nongovernmental organization (NGO); Third party government; Third sector; Voluntary society

## Definition

Government and nonprofit relationships: Ways in which government entities and nongovernmental, nonmarket based entities relate to one another in the delivery of goods and services to populations.

Marketization: When nonprofit organizations adopt approaches and values of the private market.

## Introduction

The relationships between government and nonprofits are as dynamic as the array of the institutions that exist in each sector. Many factors influence the shifting nature of government nonprofit relationships including, an individual nonprofit's organizational and legal form, the specific national context in which nonprofits are embedded, and the traditions and role of nonprofits

within a society. In addition, the dual role of government as collaborator and regulator inherently creates a tension which often defines how the sectors interact to provide goods and services to society.

This entry will examine government nonprofit relationships and their key features. It will begin with a discussion of the theoretical perspectives that inform our understanding of these relationships. Then current trends are identified which affect government and nonprofit relationships in the United States and globally. Finally, the implications of these relationships and how theory and practice suggest reconciling their contradictory nature are discussed. For this entry, the term nonprofit will be used to represent other common terms including nongovernmental organizations, international nongovernmental organizations, civil society, and third sector.

## Theoretical Perspectives

Theoretical perspectives are a set of assumptions which guide our thinking on a particular topic. Theoretical perspectives help give meaning to specific observations and inform questions as we explore topics further. Sometimes theoretical perspectives are referred to as a "lens" bringing "focus" to an aspect of a topic. Since government-nonprofit relationships are multifaceted, constantly changing, and involve inherent tensions, we are unlikely to find a single coherent theory explaining these relationships and emphasize the need to explore multiple theoretical perspectives.

Government nonprofit relationships are developed within diverse political, economic, social, and historical contexts. For example, while there are many examples of government support and development of nonprofits throughout US history, our contemporary understanding of how government and nonprofits increasingly rely on one another continues to evolve in new ways. In fact, nonprofit organizations were viewed as the private sector until the late nineteenth century despite their role in serving the public purposes. It was only after US legislation began to establish tax exemption for certain organizations, tax deductions for charitable contributions, and the nonprofit corporate structure that clearer distinctions between government, for-profit, and nonprofits were established. While this discussion implies that government and nonprofit entities are distinct and separate, in reality the boundaries are blurred. For example, some US nonprofits have taken on characteristics of business organizations by creating for-profit subsidiaries to subsidize their charitable work. In the European context hybrid, administrative arrangements which exhibit both public and private characteristics are common in healthcare, education, and other human services organizations and systems. Some Asian countries have grown substantial nonprofit sectors while maintaining them under government control.

Despite this complex reality, Young (2000) presents a useful conceptualization of nonprofit government relationships. Young's approach accounts for the complexities described above and correctly suggests that while any single lens lacks full explanatory power of nonprofit government relationships, certain themes continue to be relevant over history and in both US and global contexts. Specifically, Young incorporates strands of economic theory perspectives to describe nonprofit relationships as supplementary, complementary, or adversarial to government, and suggests these roles can and do exist simultaneously. For example, it is common for a nonprofit to be funded by government to provide a service it cannot provide while subjecting the nonprofit to rigorous oversight and accountability measures. Likewise, many government funded nonprofit service agencies advocate for public system policy change on behalf of their constituents.

### Supplementary

Classic economic theories were first applied to explain the presence of nonprofit agencies in the market and then were further developed to explain the government-nonprofit relationship. Contract, market, and government failure theories suggest nonprofits meet demand for goods and services that cannot be met by government and therefore take on a supplementary role. For example,

healthcare services are largely provided by nonprofits due to the public's need to trust that the quality of and access to medical services will be maximized even when not profitable. At times, nonprofits step in and provide services, such as support for refugee populations, when government cannot meet the needs of a diverse population base due to limits of the political system. In both the United States and Israel, nonprofits played a critical supplementary role in meeting the needs of society prior to the development of that state.

Supply theories suggest that nonprofits have access to resources not available to government, like donors and moral entrepreneurs, which are necessary to provide services in the absence of personal or financial rewards (Smith and Gronbjerg 2006). This theory predicts nonprofit supplementation of government services when public preferences are volatile or demand is heterogeneous. For example, as the desire to address mental health issues moved from institutional approaches to community-based solutions, nonprofit service provision for mental health treatment expanded.

### Complementary

Salamon (1993) used economic theories to explain government-nonprofit partnerships and interdependence. This approach suggests that nonprofits have corresponding failures that complement those of government. This complementarity has defined this partnership for most of US history and is also evident in Europe (Salamon and Toepler 2015). Complementary nonprofit government relationships are commonly found in social services, arts and culture, community and civic development, education, research, and healthcare. Nonprofit agencies have a unique ability to provide these services where local preferences and differentiation of services to diverse groups are required. However, nonprofits often lack the ability to fully fund their activities through philanthropy and require government funding. Government agencies, on the other hand, need to be responsive to the public demand for services which are differentiated by geography and meet the needs of diverse constituents, but are unable to grow the public bureaucratic structure necessary to accomplish this goal. From a funding perspective, the presence of this complementary relationship is highlighted by the fact that across 32 countries public sector support on average accounts for 35% of nonprofit revenue – nearly three times that of philanthropy (Salamon et al. 2004). Public support for US nonprofits is more than double philanthropic support, accounting for 32.5% of revenue (McKeever 2015).

### Adversarial

Government nonprofit relationships can be expressed as adversarial when nonprofits engage in some forms of advocacy, make proposals for new programs not supported by most of the public, or where a minority group of citizens organize. Furthermore, complementary relationships can have an adversarial aspect as government agencies license and regulate nonprofit agencies they fund for service provision. In some cases, nonprofits and government may simply oppose one another due to having different missions or priorities necessary to serve their constituencies. Nonprofits may also be perceived as threats to governmental power when considering their role in calling for government accountability in more controversial social issues like race relations, the environment, and immigration.

### Alternatives to Economic Theories

Smith and Gronbjerg (2006) offer alternatives to economic theories which are based on supply and demand frameworks. The first is civil society and social capital perspectives, which address the need to examine the distinctive values and social relations embedded in the nonprofit sector and therefore government nonprofit relationships. Civil society, referring to networks of associations, groups, and informal activities that exist apart from the state and the market, is recognized in the literature for its contribution to democracy and freedom. Within this theory, concepts like responsiveness, cooperation, obligation, social capital, and citizen responsibility are embodied by the nonprofit sector and seen as central to democracy. Volunteer-driven nonprofit clubs and societies, while not providing public goods like other nonprofit service agencies, may serve as

important mechanisms in communities to build networks assisting citizens in becoming economically viable and addressing issues of mutual concern. These networks are increasingly being recognized by government agencies for their unique role in building community capacity, which complements larger scale initiatives to tackle poverty, crime, and other social problems.

Another alternative theory is the neo-institutional perspective, which focuses on ways the institutional environment impacts nonprofits. This theory predicts that environments with ineffective government, lack of public funding, and stringent government regulations will negatively impact nonprofits. Likewise, more favorable government regulations and incentives will favor nonprofits. An example is the US tax code, which establishes a significant advantage – tax exemption – to encourage groups to organize as a nonprofit. Furthermore, this theory reinforces the interdependence of the public and nonprofit sectors. As the nonprofit sector grows, it will likely invite more regulation and monitoring from the public sector. This approach begins to explain, to some extent, the blurring of lines between government and nonprofit agencies.

## Trends Affecting Government and Nonprofit Relationships

### Devolution

Devolution is the process of transferring power from federal to state and local governments. Devolution is most common in the United States and may be particularly relevant in relation to social welfare programs. Devolution in the United States began nearly four decades ago and has resulted in partnerships between nonprofits and state and local government to grow programs while limiting the growth of government (Kettl 2000). One of the drivers of devolution in the United States is the feeling that despite significant government investment, federal programs have been largely ineffective as intractable social problems persist. This process often facilitates not only a shift of funding but also discretion from government entities to nonprofit agencies.

Privatization is one example of a government tool implemented with some public service provision where government contracts out services to nonprofit providers. Services are increasingly delivered through vast networks with multiple layers separating the government funder and the nonprofit service delivery entity. Traditional hierarchical structures have been replaced by complicated networks, and government decision makers increasingly need more sophisticated skills – contract negotiation, performance management, and information technology – to ensure that publicly funded services are being delivered equitably, effectively, and efficiently. While privatization often allows private nonprofit agencies to assume significant discretion for service development and delivery, it may also restrict nonprofit autonomy with burdensome reporting requirements and increased expectations beyond what the public agency was held accountable. Often privatization is accompanied by increased accountability for performance and contracting arrangements where pay for performance replaces fees for services.

Beyond service provision, government nonprofit partnerships extend to diverse arenas such as economic development and regional transportation planning initiatives. One of the concerns with this shift in discretion is that nonprofits are gaining decision making capacity for use of public funds and the delivery of public services and that government agencies no longer have the more direct, traditional lines of political accountability to the public. In many cases, state and local governments have responded to criticism of its indirect administrative methods by increasing direct control on nonprofit agencies, which has the potential to stifle the independence needed to deliver the innovative services needed to address complex social issues.

### Globalization

Globalization is the international exchange and integration of ideas, cultures, and information. While some consider globalization to be a modern phenomenon, globalization likely began in the early nineteenth century (O'rourke and Williamson 2002). It has become more readily

recognized and discussed in the past two decades. In many parts of the world, domestic philanthropy and nonprofits have grown to have transnational influence. Nonprofit organizations around the globe have become powerful catalysts of policy change and have acquired significant influence as information is more readily available and no longer collected and managed solely by government entities. The influence of nonprofits is amplified in developing countries where government infrastructure and formal governance structures may lack the capacity to shape emerging societal issues. For example, nonprofits known as nongovernment organizations (NGOs) or international nongovernment organizations (INGOs) outside of the United States have significantly influenced international policy related to reducing greenhouse gases, foreign-investment rules, and reducing debt in the world's poorest countries (Kettl 2000). INGOs also play an important role in these countries providing health services, access to clean water, education, and emergency relief to disasters and crises.

### Collaboration to Address Complex Issues

Nonprofit government relationships often utilize public, private, and voluntary collaborations to address the complex nature and scale of societal problems. In the United States, public–private collaborations are employed to address a wide range of public concerns like hazardous waste reductions, youth employment initiatives, and predatory lending practices in disadvantaged neighborhoods. Significant government nonprofit collaborations are also common within child welfare reform in the United States. This is influenced, in part, by a political environment favoring downsizing of government bureaucracy to deliver human services as well as the ability of nonprofits to innovate and deliver services to unique populations and geographies (Martin 2004).

Several general pathways have led government and nonprofits to collaborate in the United States and globally. As described by economic frameworks, government and nonprofits have some complementary strengths and weaknesses, which make collaboration functional and effective. Other pathways include significant government subsidy of nonprofits in some European countries, the growing use of privatization as a strategy to reduce government structure and increase efficiency, and dissatisfaction with government performance leading to reform efforts (Salamon and Toepler 2015). Contemporary approaches to addressing significant social problems presume the complexity of the issues being addressed require collaboration and typically government and nonprofit entities are key participants in the process.

Effects of this collaboration can be seen in its economic impact. The majority of US government expenditures are related to social welfare. As contracting out of government services has increased, so has the nonprofit share of the workforce. Today, nonprofits account for almost 10% of the US labor force (Boris and Steuerle 2017). Salamon and Toepler (2015) note this trend is also evident in Europe where governments finance up to 70% of nonprofit budgets and nonprofit sectors account for as much as 15% of the labor force (Salamon and Toepler 2015, p. 2166). In both the United States and Europe, employment growth in the nonprofit sector has more than doubled overall employment growth over the past two decades. This is important because government is able to expand the diversity and geography of social and health services without expanding the government workforce, which is often unable to meet the needs of unique constituency groups. In addition, social entrepreneurs can work through nonprofits to develop innovative services, which often become part of the public service delivery system.

### Performance-Based Expectations

The growth of government support of programs delivered by nonprofits has affected the intensity of the public demand for better performance. The preference for performance-based contracts reflects the political environment, particularly in the United States, where many are growing impatient with the persistence of social problems despite decades of substantial government investment in programs to address poverty, child abuse, crime, and other social problems. This is a

challenge for both the government sector, which is accustomed to management practices designed for direct service provision, and the nonprofit sector, which lacks funding for costly information technology infrastructure required for performance-based measurement and reporting. The result is increasing competitive pressures to deliver results for intractable public problems.

Increased performance expectations highlight the need for clear expectations and explicitly defined outcomes, particularly for service provision. Unfortunately, it is often the case that outcomes are not clearly defined or measured effectively. As an example, the federal Child and Family Service Review (CFSR) standards measure the performance of child welfare agencies in accomplishing safety, permanency, and well-being for children. The measures include multiple composites and are difficult to match with discrete child welfare services like family preservation services. Several issues may arise when government standards are imposed on individual nonprofit service providers. First, because composites measure populations being served by multiple providers and different services, it is difficult to link provider performance with individual families to accountability efforts. Second, it may be difficult to understand how the individual components of a composite measure interact and how explicit practices relate to both. Also, if broad composite measures determine financial incentives or penalties, there may be an incentive for a provider to diverge from established best practices in an attempt to improve performance on the indicator. Despite this serious limitation, the CFSR is a common measure of performance-based child welfare contracts in the United States.

## Policy Advocacy by Nonprofits

High levels of government nonprofit collaboration tend to create interaction between the policy and funding environments and as a result nonprofits are adapting advocacy activities. For instance, Mosely (2012) has shown that an increase in nonprofit advocacy is positively related to increases in government funding, which can result in some human service agencies shifting advocacy efforts from clients and populations toward increasing their own funding. In some instances, this reflects the complexity of the work being undertaken by nonprofits dependent upon government funding. Nonprofits may also be important intermediaries within the legislative process in the promotion of innovative local and state policies if one branch of government is reluctant to become adversarial with another.

Thus, while the nonprofit sector has a long-standing role in advocating for public need, Hasenfeld and Garrow (2012) note that trends such as contracting out and privatization may be limiting nonprofit service organizations' scope of advocacy activities to seeking benefits for the organization and its local beneficiaries. Local government funders may adopt policies and practices inconsistent with the needs of vulnerable populations leaving nonprofit service delivery agencies unable or unwilling to directly challenge a funder through advocacy efforts. Nonprofit advocacy may lead to an adversarial relationship with its primary funder and put its operation at risk. This tension has led to state agencies repressing nonprofit agencies in sub-Saharan African countries but is also common in Russia, Egypt, and Pakistan (Rutzen 2015). One strategy nonprofits employ to address this inherent conflict is to incorporate participant voices as part of their policy advocacy. For a service provision agency, this means having a recipient of services speak on the agency's behalf and often assume a formal role in advocacy activities after receiving training on the process. This strategy serves the dual purpose of advocating for policy support and providing opportunities for citizen engagement in the democratic process.

## Marketization

Another trend affected government nonprofit relationships is marketization, or the increasing competitive pressures that have contributed to nonprofit agencies adopting approaches and values traditionally found in the private market. Salamon (1993) refers to marketization as the tendency for nonprofits to adopt market practices in order to respond to the changing environment and competition. Government agencies are faced with increased accountability for performance in

the provision of public services. As a result, they may implement practices like risk-based contracts where the contractor is held financially responsible if public service outcomes are not satisfactory. This fundamentally changes the government nonprofit relationship by introducing new competition from for-profit agencies accustomed to sharing financial risk and performance accountability expectations. This may also increase competition within the nonprofit sector by encouraging subsector participants, like healthcare entities with significant information management infrastructure and expertise, to compete for contracts in child welfare, foster care, and other traditional human services. Administrative procedures accompanying government rules and contracting procedures tend to require staff capabilities and service provision capabilities that smaller nonprofits are not able to provide.

As nonprofits respond to competition by adopting private market approaches, their ability to create and maintain civil society may be diminished (Eikenberry and Kluver 2004). Marketization can lead to mission drift and a diminished ability to represent and meet organizational commitments to constituencies, eroding the very strengths which are often sought by government in partnerships. As this occurs there is also a tendency for nonprofits to look at constituencies more as consumers rather than beneficiaries, which has implications for how vulnerable populations are viewed and provided assistance.

## Implications for Practice and Theory Development

As the social and political landscape continues to evolve, government nonprofit relationships will have to respond to increasingly challenging realities. Volatile world political arenas, devolving governments, globalization, and information sharing technologies create challenges and opportunities for government nonprofit relationships to provide public goods and services to citizens around the world. The neoinstitutional perspective informs an understanding of why nonprofits in unsupportive or hostile political environments face a number of issues in addressing complex social problems, including government constraints on activities. One of the most common ways governments constrain or control nonprofits, particularly outside of developing countries, is to restrict foreign funding by requiring nonprofits receiving funds to register as "foreign agents." Most recently, this has occurred in Uganda and Nigeria but is not necessarily dependent on a country's level of development as seen in Russia, India, and Israel. In addition to positioning nonprofits as adversaries to government, this control also hinders philanthropy as globalization has increased cross-border flows of capital and nonprofit activities. Other challenges nonprofits face in hostile political environments include burdensome registration and reporting requirements, restrictions on activities, and limits on freedom of the media. As the complexity of the world's challenges continue to grow as expressed by development initiatives, welfare advances, and human rights campaigns, philanthropic support has not kept pace. In the absence of government policies encouraging public support of nonprofits it will be difficult to continue to expect nonprofits to make significant contributions toward addressing societal issues. Economic theories suggest that continued direct government support of nonprofits is likely necessary given the interdependence of the sectors and their supplementary and complementary relationships. This is particularly relevant to public service delivery capacity, which resides primarily within the nonprofit sector.

In systems where government nonprofit relationships are well established, attention must be paid to the structure and management of these relationships so as not to diminish the fundamental strengths of the nonprofit sector. Calls for increased accountability are justified and expectations for increased performance in addressing wicked problems are necessary. Government has an obligation to require effective and equitable performance from nonprofits in the delivery of publicly financed services. Likewise, the government has a legitimate role in fostering public trust in nonprofit agencies delivering public services to vulnerable populations by implementing

accountability measures for quality of service and access. However, these imperatives can constrain nonprofits through burdensome requirements and accelerate mission drift, hindering their impact on the very constituencies that government partners desire them to reach.

Nonprofits will increasingly be challenged to maintain their core values and missions, which make them distinctive and represent the interests of their constituencies. In democracies, governments are politically accountable to the public for the services provided by the nonprofits it funds. In nondemocratic societies, nonprofits are often viewed as threats to government particularly when advocating for equality, human rights, or government protection of vulnerable populations. In both instances, there is a possibility for government intervention to require nonprofits to give up independence, mission focus, or faith- based orientation as a condition of public funding. These two issues are at the core of the government nonprofit relationship when they leverage one another to provide high quality goods and services to diverse populations in ways that neither could accomplish separately. A civil society perspective explains that when nonprofits are allowed to take initiative, and apply their unique expertise to effectively address a human need in cooperation with government, society at large benefits and nonprofits are strengthened in their ability to continue to innovate and create social capital.

## Conclusion

There are several types of nonprofit government relationships which are illustrative of its contradictory and dynamic nature. Government has created the autonomous existence of the nonprofit sector through unique legal structures and tax benefits while maintaining close oversight and regulation of it activities, including advocacy and lobbying efforts. There are important factors which influence the nature of this relationship including the governance environment. The entry discussed how theory is used to investigate particular dimensions of these relationships or to make predictions about the effects of these relationships on nonprofits. Yet, it is difficult to identify one coherent theory substantially explaining the complexities of government nonprofit relationships.

A dominant theme in modern society is widespread collaboration between government and nonprofit institutions to address contemporary economic and social problems. The continued need for collaboration in tackling complex social issues, particularly in developing countries, will sustain the trends of government not only funding but shifting discretion to nonprofit agencies to provide necessary goods and services. At the same time, increased expectations and performance-based measures are becoming an expectation, and often a stipulation, of stakeholders and funders particularly within social service reform efforts.

Devolution and globalization are trends significantly shaping government nonprofit relationships and influencing the continued presence of collaboration to address complex social issues. Both trends contribute to forms of government nonprofit collaboration where sharing of power and funding is necessary. In contrast to traditional hierarchical relationships, public services are often delivered through vast networks where nongovernmental entities have increased discretion for use of public resources and government agencies have less direct methods of political accountability to the public for outcomes. As a result, the intensity of public demand for performance accountability is changing government nonprofit collaboration and increasing competition for limited public funding. Nonprofits have responded by broadening advocacy strategies to include influence with funders and adopting market practices to remain relevant.

The interdependence of the government and nonprofit sectors in addressing significant social problems predicts the need for continued government support of nonprofits. Management of established government nonprofit relationships must account for preserving the fundamental strengths of each while increasing accountability and fostering public trust in the collaboration. Nonprofits will continue to be challenged to maintain core values and missions while responding to

competitive pressures and increased performance accountability. Society at large benefits with the presence of strong nonprofits able to innovate and create social capital.

# Government Budget Laws in Russia

Natalia Ermasova
Public Administration, Governors State University, University Park, Chicago, IL, USA

## Synonyms

The laws that govern the budgeting process

## Definition

The laws that govern the budget execution process.

## Introduction

The budget process in Russia is comprehensively regulated by the Budget Code of the Russian Federation, which sets the rules and procedures for the preparation, approval, and execution of federal, regional, and municipal budgets. The Budget Code of the Russian Federation specifies the general principles of the budgetary legislation of the Russian Federation. It identifies the organization and functioning of the Russian budgetary system. The Budget Code of the Russian Federation states legal status of the subjects of budgetary legal relations. It defines the fundamentals of the budgetary process and inter-budgetary relations in the Russian Federation.

## The Budget Code of the Russian Federation

The Budget Code of the Russian Federation N145-F3 from July 31, 1998 (with amendments up until July 23, 2013), governs fiscal policy making, budget preparation and execution, and accounting and audit. This Budget Code and subsequent amendments have established a comprehensive legal framework for fiscal management at all levels of government. Also the Budget Code identifies the procedure for executing court decisions on levy of execution on funds of the budgets of the budgetary system of the Russian Federation. It sets out the contents of the annual budget laws, defines the jurisdictions of the federal and regional governments and regulates their financial relations, prescribes the annual budget preparation and execution time schedule, and lays down rules for the public debt. This comprehensive legal framework in the Budget Code ensures consistent classification and treatment of expenditure and revenue and enables strong central control over government finances. The Budget Code of the Russian Federation states the grounds and types of liability for the violation of the budgetary legislation of the Russian. The Tax Code N146-F3 from July 2008 (with amendments up until October 2013) provides a comprehensive legal framework for taxation in the Russian Federation. The Ministry of Finance produces Main Tax Policy Guidelines each spring summarizing the main tax policy and administration changes anticipated over the coming 3 years. In addition to the Budget Code and Tax Code, there is separate legislation regulating government accounting and reporting and financial control, including a law on the Accounts Chambers (supreme audit institution).

## Tax Code in Russia

Regional governments and local self-governments of the Russian Federation shall adopt normative legal acts regulating budgetary legal relations within the scope of their jurisdiction in compliance with the Budget Code. The national government prescribes the responsibilities of these subnational governments and also assigns the revenue sources available to them. Article 3 of the Tax Code of the Russian Federation states that "the taxes and fees of the subjects of Russian Federation, local taxes and fees are established, amended or cancelled, accordingly, by the taxation and fee laws of the subjects of Russian Federation and normative legal acts of representative institutions of local government about the taxes and fees pursuant to the Tax Code of Russian Federation." Federal laws specify revenue authority, rate ranges, and allowable exemptions and deductions for each revenue source, and the Federation Ministry of Taxation administers them all. All taxes, regardless of whether they are federal, regional or local, are based on federal legislation. Within this federal framework, regional and local governments have a degree of autonomy within the constraints set by federal legislation concerning the rate structure, payment dates, and exemptions in regional and local taxation (Bird 2000). Regional and local taxes go entirely to the regions or municipalities, while federal taxes go to different levels depending on the tax-sharing arrangement set in the federal legislation (Ermasova 2008). Regions may share their tax revenues with local governments by establishing their own regional tax-sharing system. Municipal districts may do the same vis-à-vis their municipal settlements.

Article 12 of the Tax Code establishes limits on tax rates, as well as the order, time period of tax payment, and reports for given regional or local taxes, within which the statutory (representative) bodies of the subjects of Russian Federation or representative institutions of local government may adopt taxes. Their revenue laws, last reformed in 2004, provided for greater source revenues of their own than previously until late in 2008. A new article was introduced into the Budget Code (Art. 130) in 2008, setting up conditions and in some cases sanctions restricting regional budget policies. These restrictions aim to encourage regions to develop their own tax base and to improve fiscal discipline. The article distinguishes various categories of regions on the basis of the share of grants in their budget revenues. In terms of expenditure responsibilities, subnational governments have

the normally expected assignments. Their role predominates for all education before higher education, housing, fire safety, agriculture and fishing, transportation, housing, environmental protection, health care, and sport. The federal role is dominant in the judicial system, international relations, national defense, basic research, higher education, and pensions (Federal Tax Service Russia 2014; Federal Treasury 2012; Ministry of Finance 2014).

The following concepts and terms are applied for the purposes of the present Code:

- **Budget** means a form of generation and spending of monetary funds intended for financial implementation of the tasks and exercise of functions of the state and local self-government.
- **Consolidated budget** means a collection of budgets in the budgetary system of the Russian Federation on the respective territory (except for budgets of state extra-budgetary funds) without account taken of inter-budget transfers between these budgets.
- **The budgetary system** of the Russian Federation means the totality of the federal budget, regional budgets of constituent entities of the Russian Federation, local budgets, and budgets of state extra-budgetary funds, based on economic relations and the regional structure of the Russian Federation.

## Budgetary Funds in Russia

The budgets for the three federal extra-budgetary funds – Pension Fund, Social Insurance Fund, and the Federal Mandatory Health Insurance Fund – are submitted together with the budget (Budget Code Article 192, Paragraph 5) and approved by the legislature. According to Article 146 of the Budget Code, the following revenues shall be entered to budgets of the budget of the Pension Fund of the Russian Federation:

1. Tax revenues distributed by agencies of the Federal Treasury to budgets of the budgetary system of the Russian Federation from the minimum tax collected in connection with application of the simplified taxation system – at 60% normative
2. Insurance fees for obligatory pension insurance
3. Insurance fees on the basis of an additional tariff for employing organizations which use the labor of members of civil aircraft air crews
4. Penalties and fines in respect of contributions to the Pension Fund of the Russian Federation
5. Revenues from placing resources of the Pension Fund of the Russian Federation.
6. Fines, sanctions, and amounts received as a result of compensation for damage, gratuitous receipts
7. Inter-budget transfers from the federal budget passed over to the Pension Fund of the Russian Federation
8. Gratuitous receipts from nongovernmental pension funds

According to Article 146 of the Budget Code, the following revenues shall be entered to budgets of the Social Insurance Fund of the Russian Federation:

1. Uniform social tax – at the rate established by the Tax Code of the Russian Federation, as regards the part thereof entered to the Social Insurance Fund of the Russian Federation
2. Revenues distributed by agencies of the Federal Treasury to budgets of the budgetary system of the Russian Federation from payments of the following taxes envisaged by special tax regimes
3. Tax collected in connection with the application of the simplified taxation system – at the 5% normative
4. Tax collected in the form of the cost of a patent in connection with application of the simplified taxation system – at the 5% normative
5. Minimum tax collected with application of the simplified taxation system – at the 20% normative
6. Uniform tax on imputed earnings for some kinds of activities – at the 5% normative.
7. Uniform agricultural tax – at the 6.4% normative

8. Insurance fees for obligatory social insurance against industrial accidents and professional illnesses
9. Penalties and fines in respect of contributions to the Social Insurance Fund of the Russian Federation
10. Revenues from placement of temporarily available funds of the Social Insurance Fund of the Russian Federation
11. Fines, sanctions, and amounts received as a result of compensation for damage
12. Inter-budget transfers from the federal budget passed over to the Social Insurance Fund of the Russian Federation

According to Article 146 of the Budget Code, the following revenues shall be entered to budgets of the budget of the Federal Obligatory Medical Insurance Fund:

1. Uniform social tax – at the rate established by the Tax Code of the Russian Federation, as regards the part thereof entered to the Federal Obligatory Medical Insurance Fund
2. Revenues distributed by agencies of the Federal Treasury to budgets of the budgetary system of the Russian Federation from payment of the following taxes envisaged by special tax regimes
3. Tax collected in connection with the application of the simplified taxation system – at the 0.5% normative
4. Tax collected in the form of the cost of a patent in connection with application of the simplified taxation system – at the 0.5% normative
5. Minimum tax collected in connection with application of the simplified taxation system – at the 2% normative
6. Uniform tax on imputed earnings for some kinds of activities – at the 0.5% normative
7. Uniform agricultural tax – at the 0.2% normative
8. Penalties and fines in respect of contributions to the Federal Obligatory Medical Insurance Fund
9. Revenues from placing temporarily available assets of the Federal Obligatory Medical Insurance Fund
10. Fines, sanctions, and amounts received as a result of compensation for damage
11. Inter-budget transfers from the federal budget passed over to the Federal Fund of Obligatory Medical Insurance

According to Article 146 of the Budget Code, the following revenues shall be entered to budgets of territorial state obligatory medical insurance extra-budgetary funds:

1. Uniform social tax – at the rate established by the Tax Code of the Russian Federation, as regards the part thereof entered to territorial funds of obligatory medical insurance
2. Revenues distributed by agencies of the Federal Treasury to budgets of the budgetary system of the Russian Federation which received as a result of paying the following taxes envisaged by special tax regimes
3. Tax collected in connection with the application of the simplified taxation system – at the 4.5% normative
4. Tax collected from the cost of a patent in connection with application of the simplified taxation system – at the 4.5% normative
5. Minimum tax collected in connection with application of the simplified taxation system – at the 18% normative
6. Uniform tax on imputed earnings for some kinds of activities – at the 4.5% normative
7. Uniform agricultural tax – at the 3.4% normative
8. Penalties in respect of contributions to territorial funds of obligatory medical insurance
9. Revenues from placement of temporarily available assets of territorial funds of obligatory medical insurance
10. Fines, sanctions, and amounts received as a result of compensation for damages
11. Inter-budget transfers from the Federal Obligatory Medical Insurance Fund
12. Inter-budget transfers from budgets of constituent entities of the Russian Federation provided to territorial funds of obligatory medical insurance, including receipts in the form of insurance fees for obligatory medical insurance of the unemployed population

According to the Budget Code, the national accounting rules take into account international standards for financial reporting of public units such as GFSM 2001 and IPSAS. Under the Budget Code, Russia produces two sets of annual accounts: (1) a cash-based annual budget execution report shows government revenues, expenditure, and financing for the previous year; (2) an accrual-based financial statement provides an income statement, balance sheet, and cash flow statement for the previous year. Cash-based budget execution reports provide a detailed breakdown of revenue receipts, expenditure payments, and financing. Cash-based budget execution reports are produced on a monthly basis and published within 30 days of the end of each month. The financial statements record individual revenue, expenditure, and outstanding amounts of assets and liabilities on an accrual basis, e.g., expenses and the related payables are recorded when goods and services are delivered and not when government makes cash payment. Fiscal reports include an administrative, economic, and functional classification.

## Inter-budget Transfers

According to Article 129 of the Budget Code, inter-budget transfers from the federal budget to budgets of the budgetary system of the Russian Federation shall be provided in the following forms: (1) grants for leveling the budget supply to constituent entities of the Russian Federation; (2) subsidies granted to budgets of constituent entities of the Russian Federation; (3) subventions granted to budgets of constituent entities of the Russian federation; (4) other inter-budget transfers to budgets of constituent entities of the Russian Federation; (5) Inter-budget transfers to budgets of state extra-budgetary funds. The goal of general grants is leveling of regional governments' financial opportunities. These general grants include federal grants to equalize fiscal capacity and federal grants to balance the regional budget. It is a formula-based financial aid. Subventions to budgets of constituent entities of the Russian Federation from the federal budget provided for the execution of individual expenditure obligations of municipal formations are spent. According to the procedure specified in the federal laws, normative legal acts of the Government of the Russian Federation adopted in pursuance of them and/or normative legal acts of the subjects of the Russian Federation. Subventions to budgets of constituent entities of the Russian Federation from the federal budget are distributed among all subjects of the Russian Federation according to the uniform method for the appropriate type of subventions in proportion to the amount of population (individual groups of population), consumers of appropriate region (municipal) services, other indices subject to the normative standards of forming budgetary appropriations for the discharge of the appropriate obligations, and objective conditions affecting the cost of regional (municipal) services in the subjects of the Russian Federation. The plan of distributing grants for leveling the constituent entities' budget supply to constituent entities of the Russian Federation shall be introduced to the State Duma within the composition of the draft federal law on the federal budget for the next financial year and planning period and shall be endorsed when considering the said draft federal law in the second reading (Article 132).

Subsidies for balancing the budget are the most opaque type of financial aid. Their goals vary across the regions: (1) financial funding to most politically troubled North Caucasus republics, (2) support of depressed areas (Ural and Volga regions), (3) compensation for regions that had financial problems due to the reduction of corporate income tax in budget (Tyumen region), and (4) compensation for regions with high level of expenditures due to natural and weather conditions (Chukotka Autonomous area). The choice of regions to receive subsidies proceeds in an opaque fashion, and the amounts allocated are not determined by objective criteria or by formula. Russian transfer policies have suffered in the past from both a lack of transparency and a "soft" adjustment to current budgetary needs, thereby weakening incentives and responsibility at lower levels of government (Ermasova and Mikesell 2016).

A revision in the Budget Code in 2003 created the Oil Stabilization Fund, and a 2004th year revision reformed fiscal relations with the regions

and prescribed fiscal rules for subnational governments. The government's Budget Code and fiscal rules provide robust procedures for the management of the risks from volatile oil and gas revenues, government guarantees, and subnational governments.

## Budget Laws in Russia

The annual budget law covers the vast majority of tax, nontax, and nonrefundable revenue (Budget Code Article 41) collected by the federal government. The revenue from the delivery of certain non-statutory and demand-driven goods and services (e.g., health and education) is not included in budget revenue. Federal and subnational borrowing is authorized by law, and the government's debt management strategy is set out in the Ministry of Finance's Public Debt Management Report (PDMR). The budget law for the year ahead and the 2-year planning period thereafter sets ceilings on domestic and foreign debts, as well as programs for domestic and foreign borrowings. The external debt is defined by the Budget Code as debt in foreign currency, while according to international standards, it should refer to the holdings of debt by nonresidents.

The budget documentation also includes a consolidated forecast of general government revenue and expenditure (Budget Code Article 192, Paragraph 44). The government produces regular, detailed, and credible medium-term macroeconomic forecasts as part of the preparation and presentation of the annual budget (Budget Code Article 192.4). Russia has had a comprehensive and detailed medium-term budget framework mandated by the Budget Code since 2008. Budgets at the federal, subnational, and municipal level cover the upcoming year and 2-year forward planning years. The government publishes four documents which outline its fiscal strategy ahead of the preparation of the upcoming budget: (1) the President's Budget Address (required by Article 170 of the Budget Code), (2) Main Directions for Budget Policy, (3) the Main Directions for Tax Policy, and (4) Midyear Performance Report. The President's Budget Address was issued in June and outlined the key issues and the main directions of budget policy for the upcoming year. The Main Directions for Budget Policy and the Main Directions for Tax Policy contain fiscal projections for the general government, federal budget, extra-budgetary funds, and subnational budgets, an allocation of the federal budget to government programs for the upcoming year. In the Midyear Performance Report, the government reviews economic developments and fiscal performance midyear and provides prospects for the remainder of the year. According to the Budget Code (Article 192, Paragraph 1), the government should send the draft budget, including all the accompanying documentation, to the legislature (Duma) no later than October 1, 3 months before the start of the budget year. According to Article 196 of the Budget Code, the Duma should adopt the budget in three readings within 60 days of its submission, i.e., by late November. Following adoption by the Duma, the budget is sent to the upper house – Council of Federation – within 5 days. The Council of Federation should adopt it within 14 days (Article 208, Paragraph 1) and send it to the president for signature within 5 days (Article 208, Paragraph 2). In the event that budget is not adopted by the start of the financial year, monthly expenditure not exceeding 1/12 of the previous year's budget can be executed (Article 190). According to IMF (2014, p. 8), "while the Federal budget is relatively comprehensive, 14 percent is currently classified as secret for national security reasons, and there are plans for extra-budgetary expenditure and lending via sovereign wealth funds."

## Conclusions

Fiscal restructuring, including changes in relationships between governments within the nation, has been part of the change, but these changes often involve a confusing mixture of measures for greater subnational autonomy and with measures increasing central control. Problems with fiscal federalism have been a major

obstacle to economic transition in the Russian Federation. Following the revision of the Budget Code in 2004 and 2008, Russia has introduced a modern system of equalization based on indicators for tax and service capacity. The system is designed to bridge the great disparity in prosperity of the Russian regions. The system is transparent but rather complicated, especially as far as the financial incentives for tax base development are concerned. The transfer system would need to be clearly defined as redistributive and not subject to political overrides or negotiations. In the absence of such a revision, the disparities will continue, some regions will be dramatically more vulnerable to economic decline and changes in resource markets than others will, and the leaders of these vulnerable regions will lack tools to correct the results of any declines.

# Government in the Spanish Communities

Antoni Seguí-Alcaraz and
Antonio Sánchez-Ándres
Faculty of Economics, Department Applied Economics, University of Valencia, Valencia, Spain

## Synonyms

Authority; Directorate; Executive; Incumbency; Leadership; Management; Public administration; Self-determination; Self-government; Self-rule

## Definition

Government of a Spanish administrative territorial entity that, within the state constitutional legal system, is endowed with certain legislative autonomy with its own representatives and competent executive and administrative powers.

## Introduction

Rules of good governance, public information, and transparency are fundamental tools for all political action. Only when citizens know the decisions that affect them, under what criteria our institutions act or how public funds are managed can we talk of the beginning of a process in which public authorities respond to a critical and

demanding society which wants greater participation. In this way, there is a better scrutiny of public activity, thereby contributing to the much needed democratic regeneration and promoting the effectiveness and efficiency of the state and favoring economic development.

Only when the action of public officials is subject to scrutiny can citizens know what decisions are being taken that affect them, how public funds are handled, or with what criteria our institutions act. This is the starting point of a process in which public authorities respond to a society that is demanding, critical and that seeks participation with public authorities. In order to do this, first a review of legislative development is carried out, in order to later develop a comparative empirical analysis and draw conclusions.

## Clarity: Application to Economic Policy

Vergara (2007) emphasizes that the practice of clarity increases legitimacy, credibility, and trust; decreases information asymmetries; allows for better internal overseeing of politicians and officials; and prevents acts of corruption. In addition, it is considered that clarity reinforces the democratic control that citizens have the right to exercise over public administration (Pérez 2005).

Thus, greater clarity and better accountability mechanisms of the state become key criteria of legitimacy. The model of democracy that we have as a reference seeks, respecting the essence of democratic aggregations, to improve the mechanisms of representation and respond to the demand for proximity (Rosanvallon 2010), a feature of more established democracies, favoring the evaluation of economic policies.

As De León (2008) points out, there is a strong consensus in the world that clarity is an important part of the democratic process. Government clarity reduces uncertainty in decision-making thus improving governance and reducing corruption, which may favor foreign investment in the country.

Merino Cuesta (2010) says that for the evaluation of public policy, it is necessary to develop a clarity that gives legitimacy to the political decision-makers and guarantees greater independence and quality in the decision-making process. Clarity provides an incentive that can be used to increase efficiency by favoring competition for social approval by public services. Hence, it can become a stimulus to improve performance and a way of generating trust. This results in a flow of timely and reliable information from a social, economic, and political point of view that is accessible to all those involved.

## Regulations in the Autonomous Communities

All the legislation developed in the different autonomous communities is based on the Royal Decree 1418/2006 of December 1, in which the statute of the National Agency for the Evaluation of Public Policies and the quality of services is approved. The autonomous communities must use the evaluation laws in line with the regulations to demonstrate participation and cooperation with the administrations of the autonomous communities. In this section, the various legislations of the autonomous communities are detailed. First, some of their most relevant characteristics are pointed out, and then more details of the characteristics are presented in a table format (Table 1).

In Galicia, Law 4/2006, of June 30, on Transparency and Good Practices in the Galician Public Administration, already repealed in favor of a new regulation, Law 1/2016 of January 18, emphasizes the obligation of the autonomous public sector to collaborate with citizens in meeting their requests. New obligations of proactive publicity on institutional information are established, such that the General Administration of the autonomous community must set up annual and multiannual programs in which the specific objectives and activities and means necessary to execute them are defined. To this end, questionnaires are used to allow people can participate in the design and development of programs. The degree of compliance with the objectives set in the programs is evaluated periodically by the relevant bodies within the scope of the General Administration of the autonomous community. In the Balearic

**Government in the Spanish Communities, Table 1** Current situation of regulations in the autonomous communities

| Autonomous communities | State | Law/regulatory proposal |
|---|---|---|
| **1. Andalucía** | In force | Law 1/2014 of 24 June, of Public Transparency in Andalusia |

| **17. La Rioja** | In force | Law 3/2014, of 11 September, on Transparency and Good Governance of La Rioja |

Source: compiled by the authors

Islands, Law 4/2011 of March 31 focuses attention on awarding recognition to those entities or bodies that endeavor to achieve better results in the improvement of public services by establishing measures to control and prevent conflicts of interest, along with a record of activities, assets, and interests of senior officials of the Public Administration and the Government. It also proposes the evaluation of public policies through a systemic process of observation, integrity, and transparency.

In addition, Law 3/2015 of March 4 on Transparency and Citizen Participation of Castile and León closely follows the basic regulations. Furthermore, it develops citizen participation through the Open Government Portal, where the General Administration of the Community and its autonomous organizations must submit for citizen participation any draft laws, decree projects, strategies, plans, and programs. It includes the right for citizens to comment on regulation proposals or make suggestions. To do this, the General Administration uses surveys and opinion studies on matters of interest and public debates, and groups are created by the Public Administration whose purpose is to carry out an analysis of the effects of a certain policy.

In contrast, Law 8/2015 of 25 March on Transparency of Public Activity and Citizen Participation of Aragon works to create an open

government model, expanding on aspects relating to state regulations, information on public employment, the execution of contracts and political transparency, etc. It also refers to specific agencies that are used, provided with staff and financial resources, and given scope to review decisions and establish a level of sanctions. Special emphasis is placed on the reuse of public information. Thus, all information published or made available to the public by the Government of Aragon will be reusable without prior authorization. One new inclusion is that of database records, where the program will identify when the last modification occurred and who made it.

In La Rioja the Law 3/2014 of September 11 incorporates the importance of linking administrative services, albeit with different departments or different administrative units. Electronic processing according to the provisions of Article 14 will be mandatory for legal entities or groups of individuals who, because of their economic or technical capacity, have access to technological resources.

The Valencian Community Law 2/2015 of April 2 offers very little innovation with reference to state legislation, only the inclusion of a specific regulation regarding the conditions of reuse of public information, the administrative organization of the Administration of the Generalitat and its instrumental public sector in matters of transparency, and, especially, the regulation of the Transparency Council. Law 12/2014, of June 24 of Andalusia, and of December 16 of Transparency and Citizen Participation of the Autonomous Community of the Region of Murcia, or Law 12/2014 of December 26 of the Canary Islands has content and structure similar to the state regulations.

In the community of Andalusia, it is a requirement that public administrations, public foundations, and mercantile societies publish annual and multiannual plans and programs in which specific objectives are established, as well as the activities, time, and means to meet these objectives. The degree of compliance and the results must be subjected to periodic publication and evaluation using qualitative and quantitative indicators. The evaluation of public policies is considered to be the systematic process toward an integral understanding, incorporating public intervention in order to reach an evaluative judgment based on indicators regarding policy design, implementation, impact, and results. Its purpose is to contribute to the improvement of public involvement and promote accountability and transparency.

In Cantabria the Law of Transparency of Public Activity aims to promote an open and socially responsible model of government. In its general principles on transparency, it incorporates the principle of technological neutrality, opting for the use and promotion of open-source software in its operation as well as the use of open and neutral guidelines in technology and information technology. It also imposes a series of conditions for the reuse of public information and includes a complete chapter on statistical information that citizens may request if this is not available on its Transparency Portal. This gives citizens a better understanding of the activity of the public sector and facilitates the use of data to encourage more competition in the open market. Of particular relevance is the section regarding transparency of public procurement, which indicates that information regarding building project contracts offered must be made public.

The Foral Law 11/2012 of June 21 of Transparency and Open Government of the Autonomous Community of Navarra, modified by the Law 5/2016 of April 28, makes two important additions to the basic legislation of its regulations. Firstly, it seeks to encourage citizen participation and collaboration through certain instruments such as the Citizen Participation and Collaboration Registry. It includes a series of specific rights of participation and collaboration, such as the right to participate in the evaluation of public policies and the quality of services. This gives citizens the right to be consulted periodically and regularly about their degree of satisfaction with public services and with the activities managed by the Public Administration as well as participation in the development of general regulations, to propose regulatory initiatives and the right to seek the collaboration of the Public Administration in citizen activities.

Catalonia, in the Law 19/2014 of December 29, places the emphasis on interest groups, including them in the scope of application of this Law. In addition, it contemplates the creation of a Register of interest groups, in order to make public the names of those who fulfil activities of influence or intermediation. It also establishes the obligations with which interest groups must comply, among which is the obligation to comply with or accept a code of conduct that must ensure respect for the legal framework. Castilla- La Mancha requires interest groups to register in order to demand from them a code of conduct that guarantees correct use of their ability to influence. The system of guarantees is completed by an external evaluation procedure, which is entrusted to the "Síndic de Greuges," responsible for the preparation of a general annual report to be presented to the autonomous parliament. The evaluating body must establish the key indicators that should serve as a reference for performing the evaluation task. In addition, the "Síndic de Greuges" can prepare specific evaluation reports in relation to the entities and organizations that fall within the scope mentioned in the specific regional law.

Law 4/2013 of May 21 of the Open Government of Extremadura aims to promote citizen participation in the autonomous community. The Extremeño Council of Citizens, formed by all groups and individuals wishing to take part and attend its meetings, is created for the promotion of citizen participation. Citizens have the right to submit to the Administration, based on certain requirements, proposals for processing initiatives of a regulatory nature. Reuse of this information will be done in an orderly manner and following priority criteria. Priority is given to business and commercial information, to legal information, to geographic information, and to social statistical information.

The Principality of Asturias currently has the Law 8/2018 of September 14, of Transparency, Good Governance, and Interest groups, which aims to promote a governance model that moves toward a modernizing of the Administration through criteria of open government, contributing to socially responsible behavior. La Rioja devotes an entire chapter to the reuse of information of the public sector, being able to authorize exclusive rights on certain documents. The entity that authorizes them is responsible for carrying out an annual periodic review to justify its continued authorization. In addition, an Inventory of reusable public information is created which allows access to a variety of reusable information resources available through the Transparency Portal. Its scope is extensive, exceeding that provided by the state regulations in terms of the principles and obligations of proactive publication by also encompassing political parties, trade unions, and business organizations at a regional level as well as private entities that receive subsidies or public subsidies of an amount lower than that provided for by the basic regulations. The development and approval by the Governing Council of a Strategic Transparency Plan initiative that addresses the measures which contribute to promoting and developing regional policies in this area is a positive development. Of particular interest is the free access offered to digital resources of scientific and administrative output, made available for consultation and for their use in supporting the creation of products and services, through the Institutional Repository of Asturias. There is also a chapter dedicated exclusively to the evaluation of public policies. Thus, the Asturian public administrations advocate the completion of surveys of citizen opinion on transversal or specific aspects in the respective areas of competence.

The Law 4/2016 of December 15, of Transparency and good governance of Castilla-La Mancha makes its institutional and organizational information publicly available. The publication of the work agendas of the heads of the administrative support bodies of the Administration is mandatory. In addition, the entities of the regional public sector are obliged to make public their accounts.

The Basque Country is currently processing a draft law on the subject of transparency. Regarding citizen participation, it establishes a series of specific rights, such as the right to participate in the evaluation of public policies and the quality of public services, the right to participate in the preparation of general provisions, governmental planning and significant actions, the right to

promote regulatory initiatives, or the right to request the collaboration of the public sector of the Autonomous Community of Euskadi in citizen activities.

## Conclusions

After carrying out extensive central legislative research, we can see that there is a regional impact, with all autonomous communities having legislation in place and some choosing to develop their own regulations, which suggests that there is a legislative interest in transparency. The evolution of Information Technologies (ICT) has favored making public information available to citizens, thus meeting with most of the obligations contained in the regulations. We find that the disposition for transparency is irregular and not particularly advanced, and most autonomous communities, at best, play lip service to developing a portal that includes regulatory content. This regulation does not seem to be fully interpreted in the publication of the information on the different web pages. We observe that a priori what was intended in Law 28/2006 is not fully implemented. Thus, Extremadura, Castilla-La Mancha, Cantabria, and Castile and León are the autonomous communities that least develop transparency despite the fact that Extremadura and Castilla-La Mancha have regulations in place.

# Government Reforms and Public Administration Quality

Mohammad Nurunnabi
Department of Accounting, College of Business Administration, Prince Sultan University, Riyadh, Saudi Arabia

## Synonyms

Corruption; Government reforms; Public administration; Quality

## Definition

Regime change refers to the replacement of one administration or government by another, especially through political or military action or force. Reforms in government refer to change and improvement in socioeconomic status, law, and institutions.

## Introduction

Globally, "many governments have embarked on administrative reforms of one kind or another, engaging in rhetoric that resonates with the global paradigms of 'new public management' and 'good governance'" (Cheung 2005, p. 257). Research on public administration quality are not limited (Robinson 2015; Overeem 2008, 2015; Mihaiu et al. 2010; United Nations 2007; Scott 1995, 2005; Tampieri 2005; Mihai 2005; Samier 2005; Zafarullah 1987). There is mixed evidence of public administration quality under various political regimes. For instance, Cho et al. (2013, p. 131) suggest that "bureaucratic professionalism is the only feature to consistently and positively affect the quality and effectiveness of government, regardless of context. However, perhaps more interestingly, bureaucratic professionalism functions differently within different democratic contexts. More specifically . . . bureaucratic

professionalism works better in less democratic countries in terms of its impact on bureaucratic performance." Cheung (2005) also highlights that political challenges to the old regime were on the rise in Asia, which trigger nation-specific conditions shaped or dictated by institutional and path-dependency factors. He also argues that the factors may be determined by changing politics-bureaucracy relations, regime change and transition, and government-society interaction (e.g., whether public pressures can induce more proactive response from government leaders).

The purpose of this entry is to provide a concise overview of what is known about government reforms and public administration quality. It begins with our understanding of political regimes, government reforms, and public administration quality based on prior research. It then turns to a global evidence of public administration quality and government integrity. Finally, this entry concludes with practical considerations of policy.

## Prior Research and Theory

Zafarullah (1987) finds that Bangladesh's performance of administration quality after the first decade since independence exhibits a multifaceted government had deep impact upon the administrative dimensions including corruption and unstable political leadership. Later, Islam (2005, p. 1022) argues that:

> Due to the socioeconomic and political realities, the role of public bureaucracies in development in Bangladesh and Nigeria has always been complicated. . . . have been deterred by administrative corruption, the elitist characters of bureaucrats, and the lack of political commitment. He also finds that the civil servants in Bangladesh and Nigeria have been more interested in serving their own interests than in protecting the democratic rights of the public. Bureaucracies in Bangladesh have always been conservative, self-preservative, parochial, elitist, non-participative or undemocratic, and anti-development. Likewise, the bureaucracies in Nigeria are also nonparticipative and anti-developmental. Lack of administrative accountability and coordination and the reluctance of bureaucrats to delegate administrative responsibilities . . ..

Scott (1995) addressed three dimensions in discussing the regime change and bureaucratic response in Hong Kong: "(a) the traditional values of the Hong Kong public service, some of which have been maintained despite historical changes to the tasks of government; (b) the effect of Chinese resumption of sovereignty on these values; and (c) what lessons, if any, maybe drawn for public administration in other transitional, especially small, states." He stresses that bureaucracy is deeply rooted in Hong Kong.

Cheung (2005) discusses Asian administrative reforms against the background of international influence, policy diffusion, domestic politics, institutional dynamics, and administrative traditions and legacies. It has been argued that the bureaucracy-dominated nature of policy-making is seen in many Asian countries. Two types of "failures" were being addressed by such reforms. For example, "the failure (as in India and the Philippines) to create an effective and relatively incorrupt Weberian bureaucracy, and the putative failure of Weberian bureaucracies in more advanced countries such as Japan and Korea" (p. 257). The study reveals that the "old" public administration regime largely coexisted with the "new" public management approaches and tools.

Tampieri (2005) discusses performance indicator systems of Austria, Italy, and Slovenia. She argues that the Italian public administration reform is based on the principle of *buon governo*. For instance, the reforms of the public sector in Canada were based on improving human resource management, enhancing staff training and development, using performance incentives, making government more efficient, improving quality of services, partnerships with organizations/agencies outside central government, management of finance, and more effective managing in public administration. In Germany, performances of public administration are mainly oriented to outputs (objectives and outcomes) rather than inputs with the introduction of NPM. In Netherlands, significant management reforms involve decentralization to organizations at subnational level, devolution of responsibility and wider managerial autonomy, commercialization

of the public sector, and a public/private partnership.

Mihaiu et al. (2010) examine the performance of the public sector in Romania against the EU average and find that that the total score of Romania is below the EU average. Importantly, Romania has the first six indicators below the EU average with the except of economic performance that is above average.

Cho et al. (2013, p. 120) argue that the principal-agent model supports NPM. The principal is believed to reduce corruption and improve delivery of services through bureaucratic agents. However, there is a drawback in the principal-agent approach to NPM in developing countries. This is due to "political will to engage in vigorous monitoring is lacking, or worse yet, the principal is corrupt . . .In other words, the standard assumption of such a principal agent approach is that the principal is not corrupt, . . .. . . World Bank is better suited to less developed countries than NPM when considering the political context of those countries."

From a theoretical perspective, Weberian bureaucracy has been heavily criticized from the perspective of new public management (NPM). This is because the NPM advocates the pursuit of bureaucratic reforms that ostensibly intend to alter through the inception of "market principles" (Pollitt 2009). Drawing on the original insight of Weberian bureaucracy, Evans and Rauch (2000) investigated the model of bureaucracy through specific factors including recruitment, internal promotion, career stability, and competitive salaries. Evans (1995) argues that governments in less developed countries should form Weberian bureaucracy.

## Global Evidence on Public Administration Quality and Government Integrity

This inquiry provides global evidences based on the World Bank data (World Bank 2017). The data on CPIA quality of public administration rating (1 = low to 6 = high) has been used. According to World Bank (2017):

> Quality of public administration assesses the extent to which civilian central government staff is structured to design and implement government policy and deliver services effectively. Accordingly, higher scores can be attained by a country that, given its stage of development, has a policy and institutional framework that more strongly fosters growth and poverty reduction. The country teams that prepare the ratings are very familiar with the country, and their assessments are based on country diagnostic studies prepared by the World Bank or other development organizations and on their own professional judgment.

Each cluster of CPIA has equal weight (25% weight) in the overall score, which is obtained by averaging the average scores of the four clusters. For each of the 16 criteria, countries are rated on a scale of 1 (low) to 6 (high). The scores depend on the level of performance in a given year assessed against the criteria, rather than on changes in performance compared with the previous year. All 16 CPIA criteria contain a detailed description of each rating level (World Bank 2017).

However, there are some limitations in the CPIA scoring. For example, the CPIA exercise is intended to capture the quality of a country's policies and institutional arrangements. It means that CPIA score focuses on key elements that are within the country's control, rather than on outcomes (such as economic growth rates) that are influenced by events beyond the country's control. In addition, the CPIA measures the extent to which a country's policy and institutional framework supports sustainable growth and poverty reduction and, consequently, the effective use of development assistance.

On the other hand, government integrity means the extent to which the country has freedom from corruption. According to Heritage Foundation (2016), "Corruption erodes economic freedom by introducing insecurity and uncertainty into economic relationships . . . The score for this component is derived primarily from Transparency International's Corruption Perceptions Index (CPI), which measures the level of corruption in

183 countries." For instance, the CPI is based on a 10-point scale in which a score of 10 indicates very little corruption and a score of 0 indicates a very corrupt government. In scoring freedom from corruption, the index converts the raw CPI data to a scale of 0–100 by multiplying the CPI score by 10. If a country's raw CPI data score is 5.5, its overall freedom from corruption score is 55.

Table 1 provides CPIA quality of public administration rating for 69 countries (see also Fig. 1). Nine of the countries were subject to the lowest score (below 2.5). The score is based on the average between 2005 and 2016. Zimbabwe is the worst performer for public administration quality with a score of 1.96.

| | |
|---|---|
| Zimbabwe | 1.96 |
| Solomon Islands | 2.08 |
| Sudan | 2.25 |
| Afghanistan | 2.27 |
| Congo, Dem. Rep. | 2.29 |
| Togo | 2.29 |
| Timor-Leste | 2.32 |
| Comoros | 2.33 |
| Cote d'Ivoire | 2.38 |

On the other hand, 11 countries were subject to the best performer of public administration quality (a score 3.50 and above). In particular, three countries were found to be the highest scorers, namely, Samoa (3.92), Bhutan (4.00), and Cabo Verde (4.00).

| | |
|---|---|
| Burkina Faso | 3.50 |
| Dominica | 3.50 |
| Ghana | 3.50 |
| India | 3.50 |
| Maldives | 3.50 |
| Senegal | 3.50 |
| Rwanda | 3.54 |
| Georgia | 3.78 |
| Samoa | 3.92 |
| Bhutan | 4.00 |
| Cabo Verde | 4.00 |

Table 2 presents the CPIA quality of public administration rating according to World Bank Country and Lending Groups. In terms of region, four regions scored 3 and above. These are as follows:

- Europe and Central Asia (3.13)
- Latin America and Caribbean (3.10)
- South Asia (3.22)

The lowest performing regions were:

- East Asia and Pacific (2.92)
- Middle East and North Africa (2.69)
- Sub-Saharan Africa (IDA and IBRD countries) (2.87)

By income classification, it is understandable that the countries with higher income contribute to higher level of public administration quality. In this case, the highest score was found in upper middle-income group followed by lower middle-income and low-income group countries.

In the case of government integrity, eight countries were found to be the lowest scorer (higher level of corruption):

The lowest score 20 and below:

| | |
|---|---|
| Sudan | 11.0 |
| Afghanistan | 12.0 |
| Eritrea | 18.0 |
| Uzbekistan | 18.0 |
| Guinea-Bissau | 19.0 |
| Haiti | 19.0 |
| Yemen | 19.0 |
| Burundi | 20.0 |

In addition, 10 countries were subject to the highest score (40 and above) (low level of corruption):

| | |
|---|---|
| Sao Tome and Principe | 42.0 |
| Senegal | 43.0 |
| Ghana | 48.0 |
| Lesotho | 49.0 |
| Rwanda | 49.0 |
| Georgia | 52.0 |
| Samoa | 52.0 |
| Cabo Verde | 57.0 |
| Dominica | 58.0 |
| Bhutan | 65.0 |

**Government Reforms and Public Administration Quality, Fig. 1** Public administration quality and government integrity

Table 3 presents descriptive statistics of public administration quality (PUB_QUALITY) and government integrity (GOVT_INTEGRITY) for 69 countries. The mean score of PUB_QUALITY was 2.9587 with standard deviation of 0.4565. The mean score of GOVT_INTEGRITY was 31.2058 with standard deviation of 10.6909.

A one-sample t-test was run to determine whether the score of PUB_QUALITY was different to the score of GOVT_INTEGRITY (as presented in Table 4). Both scores of PUB_QUALITY and GOVT_INTEGRITY were normally distributed, as assessed by Shapiro-Wilk's test ($p > 0.05$), and there were no outliers in the data, as assessed by inspection of a boxplot.

PUB_QUALITY score was statistically significantly lower than the population normal score, $t(68) = 53.842$, $p = 0.001$. GOVT_INTEGRITY score was statistically significantly lower than the population normal score, $t(68) = 24.246$, $p = 0.001$. In this case, $p < 0.001$ ($p = 0.001$). Therefore, it can be concluded that the population means are statistically significantly different.

Table 5 shows the results of bootstrap for one-sample test. For PUB_QUALITY, $p < 0.001$ with 95% confidence interval (2.8536–3.0589) and mean difference of 2.9587, and for GOVT_INTEGRITY, $p < 0.001$ with 95% confidence interval (28.8104–33.7234) and mean difference of 31.2058.

Table 6 presents the correlation results. Based on the Kendall's tau_b, GOVT_INTEGRITY is positively correlated with PUB_QUALITY 0.486 ($p < 0.01$). From Spearman's rho, it is found that GOVT_INTEGRITY is positively correlated with

**Government Reforms and Public Administration Quality, Table 6** Correlations

| | | PUB_QUALITY | GOVT_INTEGRITY |
|---|---|---|---|
| Kendall's tau_b | PUB_QUALITY | 1 | |
| | GOVT_INTEGRITY | 0.486[a] | 1 |
| Spearman's rho | PUB_QUALITY | 1 | |
| | GOVT_INTEGRITY | 0.639[a] | 1 |

[a]Correlation is significant at the 0.01 level (two-tailed)

PUB_QUALITY 0.639 ($p < 0.01$). Because of this, it can be concluded that there is a statistically significant correlation between PUB_QUALITY and GOVT_INTEGRITY. It means that the countries with high level of corruption are subject to lower quality of public administration.

## Conclusion

This entry has provided an overview of regime changes, government reforms, and public administration quality. It began with a discussion of political regime changes, government

reforms, and public administration quality. From a theoretical perspective, the development of public sectors was mixed around the globe. This depends on various factors including government quality, economic freedom, and social-institutional settings. Based on the evidence of the global data (69 countries), it is found that several countries were subject to poor public administration quality (Zimbabwe, Solomon Islands, Sudan, Afghanistan, Congo, Dem. Rep., Togo, Timor-Leste, Comoros, and Cote d'Ivoire), while several countries were found with the highest public administration quality like Burkina Faso, Dominica, Ghana, India, Maldives, Senegal, Rwanda, Georgia, Samoa, Bhutan, and Cabo Verde. Interestingly, the countries with higher income contribute to higher level of public administration quality. For example, upper middle-income group had higher quality of public administration compared to lower middle-income and low-income group countries. In addition, some countries were with higher level of corruption like Sudan, Afghanistan, Eritrea, Uzbekistan, Guinea-Bissau, Haiti, Yemen, and Burundi.

This entry concludes that government integrity is positively correlated with public administration quality. It means that countries' higher level of corruption was exerting lower quality of public administration. The entry has major implications for policy-makers locally and internationally on how to improve the public administration quality.

## Synonyms

Defense spending-military spending; Economic growth-economic progress; Economic growth-fiscal growth; Human capital-human resource; Public spending-civic spending

## Definition

The World Bank Group defines gross domestic product (GDP) as a monetary measure of the market value of goods and services produced in a year.

SIPRI (2014) defines military spending as all current and capital expenditure on the armed forces, including peacekeeping forces; defense ministries and other government agencies engaged in defense projects; paramilitary forces when judged to be trained, equipped, and available for military operations; and military space activities.

## Introduction

Government spending priorities and patterns in developing countries have continued to change dramatically over the past decades which makes it important to analyze the contribution of various government expenditures toward stimulating production and growth and ensuring poverty reduction (Fan and Zhang 2008). The management of the public sector as well as public expenditure plays a significant role in poverty reduction. However, this raises substantial challenges to countries with weak political commitment to pro-poor policy reforms as well as ineffective budget and planning systems (Williamson and Canagarajah 2003).

Pieroni (2009) argues that various economic growth theories tend to imply that government spending plays an important role in the long-term economic growth rate. However, the impact largely depends on the size and nature of the intervention and the different sectors of public spending because different sectors usually exhibit heterogeneous impact toward economic growth. Dakurah et al. (2001) have argued that spending in sectors like defense can impact economic growth either negatively through crowding out investment or positively through expansion of aggregate demand. This article brings to light the experience of Uganda which will be of great value to policy makers as it will illustrate how spending in certain government sectors affects economic growth.

## What the Literature Says About Government Spending

The literature on government spending is generally divided into three broad perspectives. One argues that government spending can stimulate economic growth, another argues that government spending can slow growth, and the third argues that government spending can have a neutral effect on economic growth.

### Determinants of Economic Growth

There has been an increase within the past 5 years in the quantity of research carried out to assess the factors driving economic growth in the OECD countries (Bessanini and Scarpetta 2001). Some of the determinants of economic growth that are connected to government spending include the following.

#### Physical and Human Capital

Barro (2001) argues that since the 1980s, most of the focus of macroeconomics has been toward stimulating long-term economic growth. Human

capital can be determined by the educational level that the citizens of the country attain. Chen and Feng (1998) argue that human capital is important toward achieving economic growth. To add on, the government needs to build more schools, produce better quality students, and also improve on the health-care services. Physical capital can be a major factor in determining the amount of real output per capita although this may depend on the level of technological innovation (UNTCAD 2012). It is therefore imperative for governments to direct public funds in sectors that are more productive and promote the welfare of the people.

### Expenditure on Research and Development

Petrakos and Arvantidis (2008) assert that government emphasis on research and development with consistent innovation can play a very important role in increasing production, growth, and general progress of the economy. This is because of the trend of adoption of technology which facilitates the application of efficient and effective superior ways of producing goods and services. An increase in government spending on research and development can lead to the development of new technologies as well as more effective and efficient strategies of utilizing resources and capital (Bessanini and Scarpetta 2001).

### Financial Development

Better financial systems with fewer costs encourage business and economic growth, whereas bad financial systems tend to discourage investment and growth. Khan (2001) states that there are normally costs associated with provision of financial services especially as regards borrowers and lenders. When better financial policies are made, there will be an increased number of businesses which gain access to the finance sector which then reduces the original cost of intermediation and leads to an increase in the investment returns.

## Negative Effects of Government Spending

Alsharani and Alsadiq (2014) argue that several studies investigate the relationship between government spending and economic growth using different empirical methodologies, and yet the results are inconclusive. Ramey (2009) notes that it is crucial for us to understand the positive and negative effect of government spending on GDP. Cullen and Fishback (2006) argue that analysis of spending on local retail sales generally shows a negative effect of government spending on private consumption. Miron (2010) reasons that other expenditures like Medicare and Social Security account for most of nonmilitary, non-interest expenditure. Much of the other expenditure, however, has negative effects that plausibly outweigh any positive effects. These programs have modest direct effects on the debt outlook and also reduce economic efficiency, which contributes to the debt indirectly by lowering economic growth. One example of wasteful federal spending is agricultural subsidies, which pay farmers to leave their fields fallow, reducing supply and raising agricultural prices which is a loss for consumers. Subsidies also change the amount and manner of farming, distorting the use of land for farming versus other activities. Also as regards education, the argument for government subsidy holds that private demand is insufficient, because education might generate positive externalities, implying the social benefit exceeds the private benefit. In that case, individuals purchase less than is socially optimal. Also private demand might be too low because some people cannot afford education or borrow to finance it. This is less efficient than an alternative method of vouchers. Under a voucher system, governments provide students with pieces of paper that schools accept as payment because the government redeems them for money which becomes more efficient.

## Factors Hindering Economic Growth in Africa

Some of the factors that hinder the progress of economic growth in Africa include the following.

### High Public Spending

Chen (2006) argues that public spending tends to be either productive or consumptive in nature. Huge public spending that is productive can lead to economic growth, whereas huge consumptive public spending does not lead to economic growth. Sub-Saharan African countries have tendency to carry out excessive public spending which is bad for the economy (UNTCAD 2012).

### Defense Spending and Economic Growth

Gerace (2002) argues that the nexus between defense spending and economic growth is not easy to generalize. However, there is great deal of literature published by political scientist and economists that does not depict any general consensus on whether defense spending affects economic growth positively or negatively. Aizeman and Glick (2003) have also noted that the effect of defense spending on economic growth is a non-linear function.

Yakovlev (2007) states that under the Keynesian effect, defense spending increases aggregate demand with extra capacity which increases on utilization of capital and reduces on unemployment, hence stimulating growth through infrastructure development, education, and research and development among others. On the supply side, the defense sector strains the civilian sector for human capital, physical labor, and even natural resources.

Smaldone (2006) argues that the concept of military spending in Africa just like other regions denotes to a relationship where the defense sectors financially compete with other public sectors, which in turn affects the distribution of available goods and social economic outlook, hence the concept of guns versus butter.

### Positive Impact of Defense Spending

Cuaresma and Reitschuler (2004) advance the argument that defense spending can stimulate growth and that defense cuts can have negative effect on economic growth of a country. This kind of argument has been very popular in the United States. This can be explained by a strong link to the multi-industrial complex of the politics.

### Negative Impact of Defense Spending

Hannah (2003) argues that the single biggest obstacle to development is the worldwide expenditure on the military. This is because the military crowds-out the civilian investments that are more productive, and if the military imports are substantial, then this will even create a balance of payment problem for the country. The econometric model asserts that increased military spending discourages investments as it could signal the existence of underlying tension that contains the potential of conflict (Arunatilake et al. 2001).

### Drivers of Economic Growth in Africa

Most African countries have been experiencing economic growth at a faster rate since the beginning of the millennium. Their economic growth has been experienced in the areas of trade, increase in government revenue, infrastructural development, and provision of better social services. Between 2001 and 2008, Africa was one of the fastest growing regions in the world. But despite all the progress, the current growth rate is neither sustainable nor inclusive. African countries rely heavily on natural resources as their economic drivers. However, most of these resources which include minerals and non-minerals are being exhausted at a fast rate. Africa still experiences low per capita agriculture output compared to the global average. More so, it is estimated that about 30% of the sub-Saharan population is malnourished. This means that more effort should be made toward intensifying agricultural production in the African region [UNCTAD (2012)].

## Data Sources

The article reflects panel data from the World Bank Database and Stockholm International Peace Research Institute from 1988 to 2012 because this time frame has got available data from the World Bank and Stockholm International Peace Research Institute. It was made up of GDP, GDP growth, GDP per capita and military spending, spending on health, spending on education, spending on agriculture, and spending on industry as a percentage of GDP. The regression used both the fixed effects model and dynamic panel data model. The article reflected the regression analysis which entailed

GDP Growth it = $f$ (Military $\text{Spending}_{it}$, Military $\text{Spending}^2_{it}$, Agricultural $\text{Spending}_{it}$, Industrial $\text{Spending}_{it}$, Spending on Research and $\text{Development}_{it}$, spending on $\text{health}_{it}$, spending on $\text{education}_{it}$, spending on $\text{exports}_{it}$, $\xi_{it}$).

## Spending Priority Sectors and Their Significance

The regression results are presented using both fixed effects model and dynamic panel data

model. These models were chosen because the fixed effects model provides room for diagnostic information about the extent of heterogeneity in the panel data. Furthermore, the dynamic panel data model allows for greater heterogeneity in the parameters in comparison to the fixed effects model. The dynamic panel data has also got the advantage of controlling for the effects of unobserved or missing variables.

Under the fixed effects model in Table 1, the variable of military spending is significant at 10% in model 1. In model 2, military spending is also significant at 10%. Military spending$^2$ becomes significant at 5% in model 1, and in model 2, it is not significant. Industry value added is statistically significant at 1% in model 1, while in model 2, industry value added is significant at 5%. Agriculture value added is significant at 5% in model 1 and is also significant at 5% in model 2. The health, education, and export variables are not significant in both models 1 and 2

As regards the coefficient, the variable of Lag $GDPl_{it-1}$ is not significant in model 2. Regarding the interpretation of the model, an increase in military spending on model 1 by 1% lowers GDP by −025% as derived from Bm1 + 2-(Bmilex$^2$) = −0.1832821 + 2(−0.032626) = −0.25%.

In model 2, an increase in military spending by 10% impacts GDP by 0.08%. As the variable of industry value added increases by 5%, it will negatively impact GDP by −0.65% and by −0.42% in model 1 and model 2, respectively. The health variable is not statistically significant in both model 1 and model 2. Also, the education variable is not statistically significant in model 1 and model 2.

Agriculture value added is significant at 5% and negatively impacts GDP by 0.43% in model 1 and model 2; agriculture value added is significant at 5% and negatively impacts GDP by 0.37%. The export variable in model 1 is not significant.

Model 1 shows the effect of military spending$^1$, military spending$^2$ industry value added, and agriculture value added which have a statistical significance on the GDP. Model 2 shows the effect of military spending$^1$, industry value added, and agriculture value added which are significant variables and affect economic growth.

Interestingly, military spending negatively affects the level of economic growth for Uganda which connects with previous studies of Ali (2012), Dunne (2010), and Eric and Hamid (2009) who have advanced arguments that military spending has a negative impact on economic growth.

Furthermore, previous studies have argued that spending in public sectors which are productive stimulates economic growth. In model 1, education and health were depicted as not significant to economic growth. Model 2 did not show the significance of the health variable, while education

**Government Spending Priorities in Uganda, Table 1** Panel data estimates with GDP as a dependent variable

| Variables | Model 1: fixed effects | Model 2: dynamic panel data model |
|---|---|---|
| Lag GDP $L1_{it-1}$ | | −0.2322212 (0.70) |
| Military Spending, $Milex1_{it}$ | −0.1832821 (1.6)[a] | 0.0756912 (1.77)[a] |
| Military Spending, $Milex^2_{it}$ | −0.032626 (2.71)[b] | |
| Industry Value $Added_{it}$ | −0.6456302 (2.88)[c] | −0.4237822 (2.14)[b] |
| $Health_{it}$ | −0.0576703 (0.31) | 0.2151931 (1.1) |
| $Education_{it}$ | −0.1335256 (0.22) | 0.7122911 (1.48) |
| Agriculture Value $Added_{it}$ | −0.4323112 (2.73)[b] | −0.3696432 (2.41)[b] |
| $Export_{it}$ | 0.1687213 (1.33) | |
| $Constant_{it}$ | 22.21375 (3.02)[c] | 19.903123 (2.17)[b] |
| F | 0.0021 | 0.0252 |
| $R^2$ | 0.4216 | |
| N | 60 | 40 |

[a]Statistical significance at 10% significance level
[b]Statistical significance at 5% significance level
[c]Statistical significance at 1% significance level

was also not significant. This could be attributed to explanations like corruption which is high within the government systems. Others include poor policy management and implementation which downplays the impact of resources that are channeled to some of the public sectors like education, industry value added, health, and agricultural value added. For instance, most industries in Uganda are small-scale industries which continue to receive funds from the government, and yet they have low output. In addition, the agricultural sector receives funds which are channeled to support subsistence rural agriculture instead of supporting mechanized modern agriculture. As regards the health sector, the government has been focusing on channeling most of the funds allocated to the health sector to control infectious disease like HIV/AIDS and malaria among others. This strategy is more of a curative approach but not preventive which most times negatively affects growth as it is not sustainable. This contradicts with the arguments raised by sources like UNCTAD (2012) and The World Bank (2014) which advocates for more spending in the health and education sectors as a strategy for driving economic growth in sub-Saharan Africa.

## Conclusion

This article highlights the importance of government spending priorities in Uganda. By far the biggest public spending in Uganda is directed to military programs. However, this has affected other sectors like health, education, and agriculture. Spending in civilian sectors can stimulate economic growth.

# Government Structure in Russia

Natalia Ermasova
Public Administration, Governors State University, University Park, Chicago, IL, USA

## Synonyms

Authority; Governance

## Definition

Forms of governance, refers to the set of political systems and institutions that make up the organization of a specific government.

## Introduction

In 1991, after the Union of Soviet Socialist Republics' dissolution, Russia began transitioning to self-rule as the Russian Federation. The new government adopted its constitution on Dec. 12, 1993. Russia is a federal state with a three-tier governmental structure: the federation, the regional level, and the local level. Each subject of the federation possesses its own foundation laws (constitutions for the republics, charters for all others), political institutions, and legislation. In recent years, significant progress has been made toward greater consistency between the regional and federal legal systems and a more unified economic and security space across the federation. The government's structure has undergone several major changes since 2003. The main changes were reforming the system of local self-government in Russia. The lowest governmental level is the local level (or local self-government level). Local governments are established to govern urban and rural settlements and other territories mindful of historical and other local traditions.

## Russian Government Structure

The government of the Russian Federation consists of the Chairman of the Government of the Russian Federation, Deputy Chairman of the Government of the Russian Federation, and federal ministries. The President is elected directly by the population through universal suffrage. The Parliament consists of two houses, the State Duma and the Council of Federation. The Duma has 450 members and is elected directly by universal suffrage. According to Art. 105 of the Constitution of the Russian Federation, federal laws have to be adopted by the State Duma and approved by the Council of Federation. This also holds for the annual budget law. The government is the subject of the 6th chapter of the Constitution of the Russian Federation. According to the constitution, the government of the Russian Federation drafts and submits the federal budget to the State Duma; ensures the implementation of the budget and a uniform financial, credit, and monetary policy and state policy in the areas of culture, science, education, health protection, social security, and ecology; manages federal property; implements measures to ensure the rule of law, human rights and freedoms, the protection of property and public order, and crime control; and exercises any other powers vested in it by the Constitution of the Russian Federation, federal laws, and presidential decrees.

The Russian government has three layers: federal, regional, and local. The 83 subjects of the federation includes 21 republics, 46 *oblasts* (provinces), 9 *krays* (territories), 4 autonomous *okrugs* (areas), 1 autonomous okrugs, and 2 federal cities of Moscow and Saint Petersburg.

(A policy of amalgamation reduced the number of subjects from the initial 89 in 2013.)

According to IMF (2014), the Russian public sector comprised 81,954 separate institutional entities of various legal forms:

- 12,402 budgetary central government entities including federal government ministries, agencies, budgetary organizations, and legislative and judiciary bodies that receive all of their funding from the federal budget and keep their accounts with the Federal Treasury
- 4,389 central extra-budgetary organizations as autonomous and semiautonomous government entities that are partially financed by transfers from the federal budget and partly by payments from the beneficiaries of their services
- 87 social security funds including the Federal Pension Fund, Social Insurance Fund, and Mandatory Medical Insurance Fund as well as 84 regional governments
- 23,185 subnational governments including 83 state (regional) governments and 23,102 local governments (municipalities)
- 31,092 public corporations comprised of 22,440 unitary enterprises, 308 government corporations (11 financial and 297 non-financial), and 8,344 joint stock companies
- 10,799 other, unspecified government-controlled entities

This structure may be explained with the following example. Belgorod oblast is 1 of the 83 regional governments. Within the Belgorod oblast, there are 309 primary localities, including 19 municipal districts; 3 urban districts, one of which is Belgorod City; 25 urban settlements; and 262 rural settlements.

## Formation of Government Structure in Russia

The Russian federal government created its subnational governments in 1996. The Russian Federation is a federal republic with a presidential system of government since the dissolution of the Soviet Union in 1991. The Russian Federation, in accordance with Article 5 of the 1993 Constitution of Russia, consists of equal subjects of the Russian Federation with equal rights in their relations to federal authorities (Arts. 5.1 and 5.4). Each subject of the Federation possesses its own foundation laws (constitutions for the republics, charters for all others), political institutions, and legislation.

The President of Russia does not belong to the executive or any other branch of power, although he has enough authority to influence governmental activities. The President is a guarantor of the constitution, of the rights and freedoms of humans and citizens. He takes measures to protect the sovereignty of the Russian Federation, its independence and state integrity, and ensures coordinated functioning and interaction of all the bodies of state power. He also determines the guidelines of the home and foreign policies of Russia and represents the Russian Federation within the country and in international relations.

An additional layer – the Federal District – was created by President Putin in 2000, but the districts are not a constitutional part of the administrative-territorial division of the Russian Federation and were created by analogy with military districts (Decree of the President of Russia Vladimir Putin № 849 "On the Plenipotentiary Representative of the President of the Russian Federation in the Federal District" on May 13, 2000.) The federal districts have no revenue and expenditure authority; they are only for administrative supervision and control. There are more than 24,000 local governments, with dramatically different levels of economic strength, level of development, and institutional capacities. Moscow and Saint Petersburg (cities of federal significance) are given separate special treatment. The very existence of Russian local government arises more from administrative convenience and outside pressure than from popular demand for independent local governments (Evans and Gelman 2004). Soviet-era local administrative districts ("raiones") are the primary geographic basis for the units of Russian local governments. The federal and regional governments charter Russian local governments.

## Revenue Sources

The national government prescribes the responsibilities of these subnational governments and also assigns the revenue sources available to them. Article 3 of the Tax Code of the Russian Federation states that "the taxes and fees of the subjects of Russian Federation, local taxes and fees are established, amended or canceled, accordingly, by the taxation and fee laws of the subjects of Russian Federation and normative legal acts of representative institutions of local government about the taxes and fees pursuant to the Tax Code of Russian Federation." Federal laws specify revenue authority, rate ranges, and allowable exemptions and deductions for each revenue source and the Federation Ministry of Taxation administers them all. All taxes, regardless of whether they are federal, regional, or local, are based on federal legislation. Within this federal framework, regional and local governments have a degree of autonomy within the constraints set by federal legislation concerning the rate structure, payment dates, and exemptions in regional and local taxation. Regional and local taxes go entirely to the regions or municipalities, while federal taxes go to different levels depending on the tax-sharing arrangement set in the federal legislation (Budget Code 2008). Regions may share their tax revenues with local governments by establishing their own regional tax-sharing system. Municipal districts may do the same vis-à-vis their municipal settlements.

Article 12 of the Tax Code establishes limits on tax rates, as well as the order, time period of tax payment, and reports for given regional or local taxes, within which the statutory (representative) bodies of the subjects of Russian Federation or representative institutions of local government may adopt taxes. Their revenue laws, last reformed in 2004, provided for greater source revenues of their own than previously until late in 2008. A new article was introduced into the Budget Code (Art. 130) in 2008, setting up conditions and in some cases sanctions restricting regional budget policies. These restrictions aim to encourage regions to develop their own tax base and to improve fiscal discipline. The article distinguishes various categories of regions on the basis of the share of grants in their budget revenues. In terms of expenditure responsibilities, subnational governments have the normally expected assignments. Their role predominates for all education before higher education, housing, fire safety, agriculture and fishing, transportation, environmental protection, and health care and sport. The federal role is dominant in the judicial system, international relations, national defense, basic research, higher education, and 219 pensions (Constitution of the Russian Federation 1993).

The most important two taxes are the profit tax and the personal income tax, both producing more than 30% of total tax revenue. National and regional corporate profit taxes are collected together, with the rate split into a 2% national rate and an 18% regional rate, although regional legislatures are permitted to reduce the rate to 13.5% for certain categories of taxpayers.

The personal income tax is only a subnational tax, with a flat 13% rate for all taxpayers, with 70% of revenue to regional budgets and 30% to local budgets. Excises and mineral extraction taxes are split between national and subnational budgets, and property, vehicle, and land taxes are assigned to subnational budgets, but these taxes provide relatively small shares of total tax revenues. Recently, subnational revenues from the profit tax have fallen considerably, a problem for the governments because so much of their total tax revenue comes from that tax. The value-added tax is exclusively a federal tax.

The tax on personal income (PIT) provides the main contribution to regional revenues of the budget of developed regions. In regions producing alcohol and beer (Kaluga, Tula, Tver, Novosibirsk, Kabardino-Balkaria) and petroleum products (Omsk, Yaroslavl, Bashkortostan), the share of revenue from excise taxes was two to three times higher than the federation average of 5%. The tax on personal income (PIT) provides the main contribution to regional revenues of the budget of developed regions (35–39%). Next important source of regional revenue is the corporate income tax. This tax brings around 25–35% in less developed regions and 40–50% in developed

regions. It was the reason of budget shortfall during the financial crisis 2008–2009 when the corporate income tax revenue showed a large decline in 2009 and uneven growth across regions in 2010–2011. This tax also was the reason that the real revenues of local budgets collapsed by 9.8% in 2009. The biggest source of this collapse was from corporate income tax, which fell by 28.9% (Ermasova and Mikesell 2016).

## Conclusions

The operation of the Russian revenue system, combined with the considerable range in economic capacity of the regions, gives some regions enormous revenue advantages in comparison with others. Neither revenue nor transfer systems provide a balancing from the differences in economic capacity. This disparity means that the residents of regions with high resource endowment will receive substantially greater services from their government than will those in regions with lower endowment. If the Russian government seeks a system with more balanced opportunity for all its citizens, without regard to where they might live in the country, its fiscal treatment of the regions would need to change. Because it is difficult to change basic economic resource endowment with a tax structure, any change would need to come through aggressive base equalization transfers, transfers designed to provide substantially greater resources per capita to regions that are less resource rich – those resource endowments are the product of geographic accident and not special productivity of the residents of those regions. The transfer system would need to be clearly defined as redistributive and not subject to political overrides or negotiations. In the absence of such a revision, the disparities will continue, some regions will be dramatically more vulnerable to economic decline than others, and the leaders of these vulnerable regions will lack tools to correct the results of any declines.

## Definition

Government support of small and medium-size enterprises involves state policies to create supportive and enabling environment and facilitate access to resources, capital, markets, and know-how to small and medium-size enterprises.

## New Economic Order

The transition of Russia from state to market economy, which began in 1991, was rough and painful. Although state policies encouraged business development, the population was not ready to take risks in an unpredictable and volatile

economic environment. Russian government had to take the leading role again to facilitate the enabling environment for small and medium-size enterprises (SME), to organize state-funded institutions to select and train promising entrepreneurs, to help them obtain modern technology, to provide access to start-up capital and technology. This encyclopedia entry provides an overview of the state-facilitated infrastructure created to support SME in Russia.

Russia is a legal successor of the Union of Soviet Socialist Republics (USSR). The USSR was a socialist state, which after the socialist revolution in 1917 has rejected the capitalist way of development, banned private property for the means of production, and limited private entrepreneurship. But already in 1987, Russia went through another turmoil, the "capitalist" revolution, which reinstated the idea of personal enrichment and the right to own means of production and develop an individual private business. However, after 70 years of the state ownership of the means of production, the enforcement of new laws and reinstatement of personal business initiative has become a challenge. This encyclopedia entry briefly discusses the history of small and medium-size private enterprise (SME) development in Russia before the Russian socialist revolution and then after the capitalist revolution. The entry provides the nuanced description of the post-Soviet government efforts to restore the entrepreneurial spirit and the development of SME in modern Russia.

Small farms existed in Russia in the form of individual entrepreneurship and in the form of cooperatives, known in Russia as *artels*. The *artels* started in Russia as early as in 1860 to compensate for the shortage of agrarian land, instruments, and horses among the poorest peasants. The *artels* helped survival of poor families rather than enriched the peasants. Existing feudal land ownership prevented the development and growth of agrarian SMEs. In Russia, after the Great Socialist Revolution of 1917 and Civil War in 1918–1921, all large business has been nationalized and declared state property. However, *artels* were preserved primarily to help wounded soldiers to survive in times of after-war starvation and unprecedented hardships. The provision of needed food products and consumer goods was partly secured by *artels* and partly by government-run agro-farms and factories. In order to build factories and other industrial facilities and attract business technology, new Soviet government invited foreign concessions to Russia in 1922–1927, the early years of Soviet power. Foreign concessions helped to restore industrial and agricultural production facilities destroyed during the time of the Civil War (Butkovsky 1928). Foreign concessions were allowed in Russia as a temporary measure until Russian state-run industry becomes sustainable. All large industries in the Soviet Union were owned by the state and were run and procured by government appointed managers.

Small *artels* continued producing limited amounts of consumer goods throughout the history of the USSR with varying success. From 1921 *artels* were reregistered as cooperatives with equal membership rights, where members had a voice in decision making and a freedom to leave and withdraw the shares. Artels and cooperatives started to spread from agriculture to other industries: retail, services, and consumer goods production. It had flourished in Stalin's era, and in 1953 cooperative's share in total GDP was 6%, while SME produce most of toys, 80% of metalware, 40% of furniture, 30% of textile, etc. However, several years after Nikita Khrushev came to power, in 1961–1962, the cooperatives (*artels*) and individual small farms were banned. Since, only few trades such as mineral extraction in remote areas of the country and consumer service production, such as shoe repair, customized tailoring, cleaning service, continued working as *artels*, relatively independent of state control.

In the USSR, all industries worked to fulfill state contracts; individual production was limited by the state laws. State-owned production system rejected market philosophy, which entailed luring a customer, producing goods to meet customers' needs, and tricking customers to buy whatever business wanted to sell. State planners focused on satisfying basic needs like garments, food, and shelter. Soviet industries produced goods for all. In the long run, it became clear for all that state-run enterprises were neither effective nor efficient. Therefore, in 1987 Russian government

has made a decision to introduce limited market mechanisms through the reincarnation of cooperatives, which in the short run helped reducing some of the deficits of Russian national economy.

The new law "On individual entrepreneurial activity" came into power in 1987. This law regulated individual profit-making entrepreneurship and prohibited the entrepreneurs to hire labor. In 1988 another law "About cooperation in the USSR" regulated the registration of new cooperatives. However, old laws that prohibited individual ownership of the means of production handicapped the development of productive cooperatives. Besides, old Soviet traditions were hostile to new ideas of profit-making and individual enrichment. The changes were slow and ineffective. New cooperatives were too small to satisfy the urgent public need for goods and groceries and contributed insignificant tax proceeds to the central budget. Yet, the idea to develop small business was popular among the reformers of the country.

In 1991, the USSR was peacefully dismantled. Russia has become the legal successor of the Soviet Union. New Russian government declared capitalism a new economic philosophy. To change the socialist economy into capitalist, Russian government relied on the expertise of major global financial institutions – the World Bank (WB), the International Monetary Fund (IMF), and the International Finance Corporation (IFC).Yet, no individual nor any international institution in the world knew how to orchestrate this change orderly. The WB economists have suggested the theory of "shock therapy." The "shock therapy" meant giving Russians an economic "electric shock" by forcefully and quickly changing the economic system from socialism to capitalism. For millions of Russians the shock therapy was fatal. Within 10 years of shock therapy reforms about 10 million Russians died. During first 2 years of transition, Russia "...lost close to 30% of its real gross domestic product (GDP), a decline reminiscent of the Great Depression of the 1930s in the United States. Russia also suffered very high rates of inflation – over 2,000% in 1992 and over 800% in 1993..." (Cooper 2009). The WB, IMF, and IFC experts advised budget cuts as the best and simplest economic measure. Primarily, budget cuts severely affected pensioners, children, and sick and unemployed people. The international financial institutions provided credits, which were used to pay the service of foreign experts to the large extent.

Those days the need for consumer goods and food products in Russia was high. The institutions and supporting laws were needed to establish property rights, build private bank system, stimulate entrepreneurship, regulate competition, ensure free flow of information, initiate credit and bankruptcy laws, and many others. The institute of private property has been introduced through the "privatization" program. New "liberal" government of Russia privatized national property quickly, massively, and fraudulently. For a decade, instead of building market institutions, Russian government kept cutting budget expenses and selling national property. Government issued vouchers for every government-owned small and medium-size enterprise, which only few people in Russia understood. Privatization institutes, stock exchange, and independent assessor institutions were in the teething state and could not provide for open and transparent sale of the assets. While Russian lawyers have been drafting privatization laws, the privatization was already dangerously underway (Hoff and Stiglitz 2004).

Russian people had no historical experience neither proper understanding of capital markets and could not claim their fair share of national property. Privatization benefited a small group of top managers of privatized industries, government top ranks, and criminals. The privatization program robbed 98% of the population in Russia, took their jobs and their money, and created the highest level of mistrust in government and its reforms (Volkov 2002). Russian people had no starting capital to enterprise. Thus, small and medium-size enterprises started growing from limited means and the desperation energy of former industrial and agricultural workers.

After the first wave of market institutions building through privatization waned, the second wave of individual entrepreneurship started rising. In the absence of most basic consumer goods, many jobless men and women organized unregistered import/export activities. People

started traveling to China, Turkey, and Eastern Europe to sell Soviet-made inexpensive electronics and buy dress and shoes to sell back in Russia. These trades were informal and served the survival of most Russians. The imported goods were cleared at customs as personal consumption items, and, therefore, contributed no taxes to the central budget of Russia.

In 1998, Russian government declared default on external debt. At this point, Russia could not continue using inflation to compensate for budget deficit and pay external debt. Economic activity in the country was unstable. Few working industries skillfully evaded taxation, the country had no concentrated industrial or financial assets, and individual informal business activities were impossible to tax.

## From Capitalist Oligarchy to State Oligarchy

Under the condition of limited government capacity, large privatized businesses and new financial conglomerates have become the key actors in the newly established market and political sphere (Guriev and Rachinsky 2005). In early 2000 Russian government faced the following challenges:

- to reduce the influence of large business and financial groups on the federal budget spending
- to control the macroeconomic indicators such as inflation and the exchange rate
- to regulate and control taxes of large businesses to sustain the central budget
- to reduce social tension in the country

The underdeveloped system of tax administration and collection posed a problem of the continuing budget deficit. Existing small and medium-size businesses developed skillful tax-evasion schemes. Tax authority was underdeveloped and needed to hire, educate, and train a large number of tax inspectors. The number of tax collectors has increased exponentially, and government was spending tax receipts to support this growing workforce. Budget problems looked overwhelming and unsolvable. The only way out was to increase tax burden for large business companies. To reach budget sustainability, Russian government issued new laws, established law enforcement agency, and insisted on direct management involvement of state-dominated mineral extraction companies, where the state share was higher than 50%. Politically influential owners of big companies, who opposed government pressure, were forced into exile or otherwise distanced from the Federal government.

"Creative" application of Russian tax law has led to the nationalization of the second-large oil company "Yukos." Government also forced the owner of large media-holding "Media-Most" to sell the holding to the state company "Gasprom-media." The acute attention of tax auditors and tax collectors to the activities of the largest industrial-financial companies has provided for fuller tax contribution to the state budget.

Throughout the first decade of the second millennium, Russia continued its economic development through constant legal and institutional reinvention to continue keeping an eye on large business operations. Graph 1 below illustrates successful government control over the exchange rate of the Russian Rouble.

Following the Central Bank anti-inflation measures, the annual inflation decreased from 84.47% in 1998 to 20.13% in 2000, and to 8.78% in 2010 as Graph 2 below illustrates.

Average annual wage in the country has increased from 2223 roubles per month in 2000 to 20,925 roubles per month in 2011 as Graph 3 demonstrates below.

Russian GDP grew up in 10 year by 62.33%, which in monetary terms constituted 24,799.9 billion roubles in 2000 and 39,762.2 billion roubles in 2010. The Graph 4 below presents the GDP numbers by years from 2000 to 2011.

The growing price for oil and gas, and the inflow of foreign investment to Russia have contributed to macroeconomic success. The price of oil grew 2.7 times in the period from 2000 to 2010. Foreign investors discovered various business opportunities in the country that lacked the advanced technologies for the production of

consumer goods. The spillover effect of the mineral resource price increase and the improved administration of tax collection have positively influenced the Russian economy. The Russian central government has become major economic player in the country again. In 1999–2003 government has initiated several legal acts to streamline tax deduction and to stimulate activities and tax collection from new enterprises.

To achieve budget stabilization and the reinstatement of public services to the population, Russian government continued changing laws

**Government Support of Small Business in Russia, Graph 4** Dynamic of Russian GDP. (Source: Rosstat (Russian Statistic Agency))

and state institutions. Legal and fiscal instability has led to the development of nepotism within businesses affiliated with high-rank public officials and state-run enterprises, which negatively affected market competition. The problems of excessive government involvement, bureaucratic control, and procedural limitations were increasing. The information from the Federal Antimonopoly Agency indicates that the combined share of GDP from businesses with state majority shares increased from 35% in 2005 to 70% in 2015.

In 2007 the state initiated the stimulation of the development of small and medium-size enterprises. New Federal legislation #209-FZ "About the development of small and medium-size enterprise in Russian Federation" was signed into law on July 24, 2007. This law formulated a legal definition of the terms "small enterprise" and "medium-size enterprise." It delineated and limited state involvement and laid the responsibility on local governments to facilitate the development of small and medium-size businesses.

## First Development Institutions in Russia

In the early days of the transition from socialism to capitalism, the Russian government started to establish development institutions and foundations in Russia. The oldest development institution was developed in 1994, the Foundation for Assistance to Small Innovative Enterprises (FASIE) that has come to be known as Bortnik Foundation in 1994. Ivan Bortnik left the position of the Deputy Minister of Science, Higher Education and Technology of Russia to put all his energy into the creation of the foundation. At the time when the Russian government has stopped funding scientific research, this foundation provided monies for this purpose. The foundation supported applied scientific research. The research community recognized Bortnik Foundation as an effective development institution. This foundation is among the few stable and effective supporters of science and SME in Russia till today.

In 2006 the government established the Russian Venture Company (RVC) to provide capital to active entrepreneurs. In 3 years, the RVC established eight joint-ventures, one of which was a joint-venture with Bortnik Foundation. In 2000–2007, Russian market was attractive for foreign investments. The inflow of foreign direct investments has contributed for the increase of Russian GDP, technology imports, management innovation, and the growth of employment opportunities. Those days the prevailed opinion was that to boost industrial growth, the Russian market needed only access to capital (Graph 5).

The Russian government funded the opening of two other development institutions in addition to RVC. The Rusnano State Corporation (Rusnano) and Bank for Development and Foreign Economic Affairs "Vnesheconombank" (VEB) grew up from the USSR "Vnesheconombank." The main function of all three institutions was to inject fast money into

**Government Support of Small Business in Russia, Graph 5** Foreign direct investments to Russia, in millions of US dollars. (Source: Russian statistics agency)

the growing market. The VEB facilitated quick access to funding for entrepreneurs engaged in infrastructure development. The Rusnano supported businesses in nanotechnology projects. The RVC created subsidiaries that financed innovative technologies. The RVC is currently the most dynamic funding and development institution of the three. The RVC was established to raise Russian domestic venture capital, to evaluate and develop promising business projects, and to support foreign partners, business angels, and business accelerators. However, foreign partners did not have the intellectual capacity to support the number of available investment projects (Zaslavskaya 2009). Therefore, the RVC took the role of developing these complex institutions.

## Federal Institutions for the Support of Entrepreneurship

We identify four groups of state entrepreneurship development institutions. All four have been established with the federal budget allocations. Therefore, they qualify as government-funded institutions.

### Group 1. Federal Agencies

Federal agencies subordinated to the Russian Federal Government and reported to the President's administration. These are the Ministry of Economic Development, the Ministry of Industry and Trade, the Ministry of Agriculture, Federal Agency of Strategic Initiatives, and others. The functions of Group 1 were as follows:

- Determine priorities for the stimulation of entrepreneurship
- Develop strategic ongoing stimulation programs
- Create and reorganize development institutions
- Fund stimulation programs
- Control over programs implementation and expenditure

The Agency for Strategic Initiatives was established with a special mission to reduce the administrative government control over new business ventures.

### Group 2. State Development Institutions

State development institutions were subdivided into two functional groups.

Subgroup 2.1. Institutions for loan provision. This group included a variety of corporations and banks with state funding for the development and growth of small and medium-size business.

Subgroup 2.2.Corporations and investment foundations provided free funding or subsidies.

Functions of Group 2 institutions:

- Selection and evaluation of investment projects
- Finding or co-funding
- Investments for co-funding

- Training of entrepreneurs and investors
- Provision of information

**Group 3. Development Infrastructure**

There were the enterprises for creating business infrastructure with government shares. This group represented the infrastructure development institutions such as regional agencies for technology development, export centers, free economic zones, special economic zones, industrial parks, and business incubators.

Group 3 functions: Institutions for development and support of the infrastructure

- Selection and evaluation of projects
- Infrastructure and technology access on favorable terms
- Reduced taxation
- Training
- Provision of information

**Group 4. Noncommercial Organizations (NCO) and Public Associations**

This group describes NCOs and business nonprofit associations, various types of public entities that work as representatives of business interests and lobbies. These associations are established as nonstate instruments that facilitate market development and represent the interests of new businesses. The associations support their members through the following instruments:

- Legislation and practical guidance
- Tax subsidies
- Protection from hostile takeovers
- Monitoring of business climate
- Training programs for small-business

Unfortunately, affiliation of biggest NCO of entrepreneurs with authorities has made them insufficient as an "entrepreneur unions," therefore their activity have limited impact on business climate in the country.

The functions of government support agencies and companies demonstrate government effort to stimulate business in Russia. The aforementioned activities are directed at large, medium, and small businesses.

## Best Practices: Federal Development Institutions

In one encyclopedia entry it is impossible covering all government agencies in support of development in Russia, instead here comes the description of the most active and productive state agencies. The most active among them are the Agency for Strategic initiatives (ASI), Russian Venture Company (RVC), and the Internet Initiative Development Foundation (IIDF).

The RVC is the oldest support agency, whose goals are to provide funding. In 2006–2007, experts believed that the provision of funds was the major instrument for building market economy. The rest was entrusted to the "invisible hand of the market." However, the disillusionment came fast. The emerging market lacked the entrepreneurial spirit and knowledge of business technology. Small business investment funds were nonexistent. Until now, these problems have not been fully solved. Therefore, government took upon itself to help the market. The Russian government continued providing funding to the most vigilant investment agencies such as RVC, RosNano, and Skolkovo. Currently these agencies work to develop necessary business infrastructure. The RVC transformed into a complex development agency with three major priorities: investment, innovation ecosystem, and technology development. Below we provide brief description of the RVC activities results (Table 1).

The RVC continues to coordinate the creation of ecosystems for technology developing entrepreneurs. Starting from 2010, the RVC focused on innovative business technology. The RVC established venture capital fund, organized training programs, conferences, and round tables for business angels and venture capitalists. A new line of the RVC initiative has become the development of business incubators in partnership with established businesses and corporations. Corporations benefitted from working with business incubators via access to innovation and new ideas. Start-ups, in turn, got access to funding and the infrastructure of a large partner, which potentially might become the client. The RVC is not the

**Government Support of Small Business in Russia, Table 1** RVC development results

| Investments stimulation | Development of innovation ecosystem | Development of the technological market |
|---|---|---|
| The RVC created 23 venture funds capitalized at $462.4 million in partnership with private investors<br>The RVC share in the venture capital constitutes $273million<br>191 new businesses received financial support of $236 million<br>The RVC sold shares in fully supported projects<br>The RVC provided expert support to 22 regional foundations | The investor training programs educated 264 business angels, 202 venture funds, 318 employees for corporate investment funds<br>The RVC in partnership with regional accelerators trained 800 start-ups<br>The RVC established interregional accelerators<br>The RVC funded early start-ups, at the seed stage<br>The RVC involved mass media to promote technological programs and venture entrepreneurship<br>The RVC organized special events to involve a triad of entrepreneurs, investors, and universities | The RVC, ASI, and new businesses have established the project development office for new technologies<br>New technological markets have been founded<br>The RVC continues to develop plans for new markets, ecosystems, and new technologies |

Data source: Annual report of the RVC for 2015

largest government agency, but it is more visible and active than many comparable development institutions. Government venture foundations continue working with various business projects at all stages of progress (Graph 6).

A noticeable addition to the RVC activity is the Internet Initiative Development Foundation (IIDF). IIDF was established in 2013 by the Strategic Initiative Agency to compliment the activities of the RVC. The IIDF was initially conceptualized as a support institution for start-ups at an early stage of development, such as pre-seed and seed businesses. The IIDF experts soon found that quality projects were only a few. To generate quality business projects IIDF started developing business infrastructure: business-accelerators, business angels, corporate partnerships, training courses and practices, and business-events aimed at the establishment of business ecosystem. Soon the IIDF has attracted large corporations in banking, oil production, technological ship-building, and tourism to participate in venture-partnership projects. The IIDF provided expertise for the assessment of small business capacity and to facilitate the partnership.

In 3 years, the IIDF provided investment funds for 193 projects at pre-seed level, 13 projects at the seed level, and 3 Round A projects (the level of project development). Yet, both agencies – the RVC and the IIDF – have been criticized for keeping large deposits in the banks, which suggested that many projects were not selected or underfunded. However, two agencies argued that their role was not to create but to support existing businesses. The two agencies succeeded in creating stable venture capital market in Russia (Graph 7).

The economic recession and Rouble devaluation in Russia decreased the number and value of business deals. Yet, the state foundations managed to meet the goal to maintain stable operations of private venture capital.

Business infrastructure is unevenly distributed on the territory of the Russian Federation. This irregularity is compensated by active interaction and regular communication among the affiliated institutions. The Russian business ecosystem is supported by the state. The state provides support to the entrepreneurs as suggested by the scheme below:

Most of the instruments in Scheme 1 are well known and self-explanatory. Yet, the tax privileges deserve further explanation. The Russian government determined several types of tax privileges for development agencies and special purpose technological areas and territories. Among those are free economic zone, special economic zones, fast development territories, industrial

**Government Support of Small Business in Russia, Graph 6** Relative achievement positioning of state venture funds. (Adopted from: Rosinfocominvest)

**Government Support of Small Business in Russia, Graph 7** Russian venture market in million USD by years. (Source: The Internet Initiative Development Fund 2016)

clusters, industrial parks, and techno-parks. The tax privileges consist of the following instruments: reduced profit tax, property tax, special customs tax, and payroll tax, which are especially valuable for IT companies.

## The Combination of Policy Support and Market Conditions

Lundstrom and Stevenson (2005) suggested the typology of four types of state support instruments: E-extension policy, new strategy for business development, new business establishment, and "niche" entrepreneurship policy. The goal of these support measures is to stimulate innovative business technologies such as social entrepreneurship, new technology development, and holistic entrepreneurship support. The effort is focused on changing the culture, the context, and the infrastructure for growing entrepreneurship. The government first chose to support innovative entrepreneurship, but actually extended the support to all types of businesses. Two development agencies that we discussed earlier, the RVC and the IIDF were established to support the

**Government Support of Small Business in Russia, Scheme 1** The state support instruments

innovative clusters, but later took responsibility of other new businesses and the infrastructure development. All of these support measures were provided to selected industries on the basis of innovativeness success measures.

Russia measures low on entrepreneurial activities, only 3.5% of Russians 18–64 years old express the interest in starting new business within three coming years. Established, starting, and nascent entrepreneurs all together constitute 13.4% of adult population in Russia. Russia's index of entrepreneurship activity is among the lowest listed by the Global Entrepreneurship Monitoring (GEM 2014). This fact explains the continuing growth of government involvement in economic stimulation and support of complex development institutions. The challenge that Russia currently faces is to find and stimulate independent innovative businesses rather than supporting rent-seeking private institutions that make profit on the services mandated by local governments. The complex stimulation of entrepreneurial activities includes consumer management, taxation, competition and migration policy (Storey 2008). Other measures constitute the education of new entrepreneurs and the creation of favorable business climate (Lundstrom and Stevenson 2005).There are few efforts to use complex entrepreneurship development strategy in Russia, while niche approach (development policies focuses in an industry sector or territory basis) is still prevalent.

The Agency for Strategic Initiatives (ASI) is an important player in the field of entrepreneurship development. It is larger than other development agencies in terms of its goals and scale of activities. Its goals include the improvement of investment climate, co-funding of business projects, development of human capital to meet the demand of innovative industries, and the establishment of new technological companies. ASI is unique among other institutions in partnership development that include governments, universities, business, and social assistance institutions. The ASI ranking and administrative capacity is high. The President of Russia sits on its Board of Directors. The ASI implements the initiatives in administrative regulation, creates and moderates communities, supports the infrastructure development, educational and social projects. The central mission of the ASI is to modernize the society, to reach all parts of the country through the inclusion of the maximum of population in its sphere of activity. The ASI aims at the improvement of the entrepreneurial climate by the following means:

- Reduction of regulations
- Improvement of public administration quality
- Massive involvement of business and society in the ongoing change projects

The most visible impact of the ASI has been the public service reforms. The most prominent

projects were in reduction of administrative barriers for business through the shortening of acquisitions and proprietary legal procedures, the speeding of engineering connections, customs procedures, etc. The ASI reformed regional public administration by changing the organizational charter, introducing modern management procedures and initiating project management offices. Finally, it has introduced the ranking system of regional governments for the business climate improvement. In 2016, the unified government quality measure – the investment climate national ranking – is in the process of implementation in all regions of Russia. However, the modernization of regional government system and the reduction of entry barriers are not sufficient for market development in the absence of business spirit, large labor market, and human capital (Van Stel et al. 2007).

## Conclusion

Small and medium-size business development has become the priority for Russian government in the 2012–2016. To stimulate the SME development, government has established state-funded development institutions and infrastructure agencies. The most active among them were the Agency for Strategic initiatives (ASI), Russian Venture Company (RVC), and the Internet Initiative Development Foundation (IIDF).Several development institutions were purposely established to support innovative activities of small businesses. However, the SME and individual entrepreneurs still face difficulties because of unstable external economic situation (turbulent exchange rate, fiscal policy), weak protection of property rights, and high internal administrative barriers. Until nowadays, the SME might choose to go informal to avoid taxation and exit expense. Macroeconomic conditions often slow down the expansion of the SME in Russia. However, the activities of the ASI and other state development institutions to establish favorable conditions for SME development and to improve the investment climate raise careful optimism for the evolution of prosperous small and medium-size business to create a solid foundation of a market economy in Russia.

## Synonyms

Business risks; Competition; Entrepreneurship; Government policy; Innovation; Opportunity recognition

## Brief Definitions

*Franchise* (or franchising) – It is a method of distributing products or services involving a franchisor, who establishes the brand's trademark or trade name and a business system, and a franchisee, who pays a royalty and often an initial fee for the right to do business under the franchisor's name and system.

*Entrepreneurial orientation* – A process of organization management, administration, and the assessment of business risks.

*Autonomy* – Based on the notion of entrepreneurial independence in developing and bringing into effect an idea.

*Competitive aggressiveness* – The intensity of a firm's efforts to outperform industry rivals, characterized by a combative posture and a forceful response to competitor's actions.

*Innovativeness* – The willingness to support creativity and experimentation in introducing new products/services, and novelty, technological leadership, and R&D in developing new processes.

*Proactiveness* – The forward-looking perspective with aggressive posturing relative to the firm's competitors.

*Risk taking* – A firm's propensity to take actions when the outcomes are uncertain such as moving into unfamiliar new markets.

## Introduction

Fiji is one of the most developed island nations in the Pacific. It is considered the hub of the South Pacific region due to many economic activities happening in the country despite its small size and given recent upgrades in infrastructure. Its positioning in the global frontier gives Fiji an added advantage to enjoy excellent connectivity with the rest of the world. This entry suggests how the Fijian government can support its retail franchise industry.

## Government Support/Involvement in Fijian Retail Franchisees

There is extensive evidence that sustained economic growth requires financial markets that can fund investment and entrepreneurship. While this conclusion applies to all types of entrepreneurial activity (from the largest companies to the smallest sole proprietorships and traders), studies have found that more underdeveloped financial markets particularly fail to provide funding to micro, small, and medium-sized enterprises. Large operations in Fiji are able to attract financing without a much difficulty. Banks are usually willing to lend to well-established companies, and the stock market is available for those on a rapid expansion path that have a track record. Smaller enterprises, however, are far less able to attract funding. This, in turn, impedes the growth rate of the economy as a whole. Moreover, it reduces the efficiency and competitiveness of many smaller Fijian companies. As a result, entrepreneurial talent often goes to waste.

However, there are no restrictions placed by the Fiji government on franchising arrangements. US firms operating in Fiji under franchise agreements include Independent Grocers Alliance

(IGA), Gloria Jean's Coffee, and McDonalds. The small market size imposes some limitations in Fiji, but many companies use Fiji as an export base to other Pacific Island countries. There are US branded/franchised hotels including Marriott, Doubletree, Hilton, Radisson Blu, Westin, Sheraton, Auberge, and Holiday Inn. US branded car rental companies including Avis, Budget, Dollar, and Hertz also operate in Fiji.

Further, the Honorable Minister for Tourism, Mr. FaiyazKoya declared that Fiji is open for businesses and said Fiji is the ideal base for investors who want to access the wider Pacific market of more than ten million people. The Starwood/Sheraton resort franchise is an example of innovativeness and value addition to attract customers. The resort has expanded its operations to Tokoriki Island where customers accommodated at the Sheraton can take advantage of watersports at Tokoriki Island. This paves the way for other franchises in the retail sector to be innovative through their product and service offering. It is evident that more and more investors are starting up businesses in the country; franchises being one of them where local businessmen acquire franchisee rights from the franchisor and are able to operate the global brand in Fiji.

## Methodology

This research employed the qualitative research method to obtain relevant information from managers and supervisors of retail franchisees in Fiji. This study utilized a convenience sampling technique. A total of nine in-depth interviews from eight franchisees were conducted through face-to-face and emails, with Operations Managers, General Managers, and Directors of franchisees. The key themes of the interviews are summarized in Table 1.

## Results and Discussion

The five-dimensional Entrepreneurial Orientation (EO) namely Autonomy, Proactiveness, Risk taking, Innovativeness and Competitive Aggressiveness was analyzed in this study. It was found that all five were positively related to franchisee performance. This finding is consistent with studies undertaken by Chien (2014), Coulthard (2017), and Dada et al. (2015), who indicated that there is a positive relationship between EO and firm performance.

### Autonomy

Findings reveal that autonomy depicted the strongest relationship with franchisee performance. Management clearly stated that the franchisee has freedom in terms of how it carries out business operations and are able to make decisions without constant interference from the franchisor. However, franchisors do exert control in order to protect the brand itself, which is an essential intangible asset for operations and present a stable system to customers. Managers interviewed mentioned that they did not have the freedom to sell non-franchisor products. It is clear that franchisors rely on franchisees' knowledge of the local market to appropriately adapt brand outcomes. However, franchisors often restrict the franchisees' ability to respond to local market conditions by controlling advertising, promotions, and territory (Jang and Park 2019).

### Proactiveness

The second strongest relationship with franchisee performance was reflected by proactiveness, as per findings. In Fiji, franchisees can offer unique and quality products/services. They have the resources and technologies that competitors may lack, are able to create demand for their products, able to forecast future demand of products and make necessary changes, and create new policies that help to sell more of franchisee products. In their research, Dada et al. (2015) also achieved high scores for proactiveness (termed "internal locus of control") and asserted that franchisees are proactive, self-reliant, self-determined, and self-confident, and believe that achievement is due to ability and effort.

### Risk Taking

The third strongest relationship related to franchisee performance was linked with risk taking. Management conveyed how the franchisee placed a high level of trust in the franchisor brand and

does not hesitate to invest in new projects when opportunities arise. This finding is consistent with Evanschitzky et al. (2017) who found that seeking challenges and risk taking are associated with high levels of opportunism that lead to franchisee satisfaction.

### Innovativeness

Innovativeness also contributed to franchisee performance where managers are very concerned about catering consumer behaviors and consumer needs. A franchisees' ability to adapt to existing products or new ways of delivering products to the market has been said to be the most common type of innovation. Franchisee managers in Fiji said their companies introduced new products for customers, made changes to current products to appeal better to customers, produced quality products that highly benefit consumers, and ran promotions to grab consumer attention.

### Competitive Aggressiveness

While some managers felt that they were competing aggressively, overall, results indicate that competitive aggressiveness as an EO dimension did not significantly contribute to franchisee performance. This means that franchisees in Fiji need to engage more strategically, with a focus on: solving customer-related problems, quality, and availability of high consumer demand products, a need to stand out amidst competitors and show distinctiveness through products/services offered. It was evident that there is a real need to better understand the needs and requirements of consumers and to develop tailored promotions in line with their needs and requirements. The level of competitive aggressiveness depends on a country's economic environment as well as competition from individual competitors. In today's competitive landscape, firms cannot rely on internally controlled resources alone to pursue advantage-creating and advantage-enhancing strategies. They must collaborate with other firms to gain access to information, skills, expertise, assets, and technologies and thus leverage their internal resources.

### Sustainability of Franchisees

Only a handful of franchisees stood out among others and have sustained their operations in the

Fijian market. This is not only the case of Fiji. Ayup-Gonzalez et al. (2019) mention that this is a common problem in both developed and emerging countries. According to a comparative study of Mexico, Argentina, Chile, the USA, and Spain, over 70% of businesses, whether franchises or otherwise, never continued beyond their fourth year of existence. The true challenge is franchising continuity, rather than opening.

Croonen et al. (2016) stated that the local business context is an important expectancy consideration affecting franchisee entrepreneurial behavior. Hence, management needs to have a better understanding of its local environment and develop strategies that would assist in sustaining franchisee operations in Fiji. To illustrate the external environment in Fiji, factors such as the GDP of the country and its competitiveness index take into account the risk and uncertainty that affects business decisions. GDP growth during the same period has also been progressing at a respectable rate, partly reflecting at the normalization of agricultural and tourism export earnings following 2016's Cyclone. Likewise, contextual factors such as inter-bank interest rates, investment levels, political periods that determine public policies, and periods of crisis and commercial growth are all situations that affect the decisions and operations of franchisees in Fiji.

One of the barriers to franchisee sustainability is that businesses in Fiji have had to cope with increasing bureaucratic interference and a complex land ownership system (The Heritage Foundation 2020). This is fairly true for hotel franchisees who mostly operate on native land. For instance, one of the Managers from a prominent resort in Fiji stated that "major restriction is the local landowners." This could possibly be attributed to resort expansions and conflicts over royalties paid to the landowners. Members of the business community are often not consulted by the government on policies that affect them. Another barrier is that market openness to foreign investment is below average. The government will need to prioritize policies to lower tariffs, ease investment restrictions, and privatize state-owned enterprises. These improvements would then possibly improve franchisee operations in Fiji. By implementing positive steps and immediate response to challenges, franchisees can actually go further in the franchise retail industry (Doherty and Alexander 2004). Franchise firms should evaluate the population (market size), consumer ability to purchase, regulatory framework of the government for businesses, and the currency and legal system of the country.

## Conclusion and Recommendations

There is a need for a local franchise association. This could entail a public-private-partnership (PPP) to drive the association between complementary entrepreneurial networking and the entrepreneurial ecosystem for sustainable franchising in Fiji. Part of the authorized distributors' mutually beneficial networking is directly connected to multi-actor networks that continuously simplify their local access to affordable franchise financing, mentors, and supportive leaders. Also, the same association will be mediated through PPP supported franchise-business information and assist local franchisees in growth and progress. Also, since there is an absence of an entity in Fiji that gathers franchise information, it is suggested that there be an institute similar to the National Centre for Small and Micro Enterprise Development (NCSMED) that is specifically set up for SMEs in Fiji, with the view that they record franchisee information.

# Governmental Accountability

Tammie Clary and Clifford McCue
School of Public Administration, College for Design and Social Inquiry, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Accountability; Answerability; Confidence; Duty; Integrity; Liability; Responsibility; Trust

## Definition

Accountability is defined as accepting responsibility or accounting for one's actions.

## Introduction

A fundamental tenet of good governance is that we expect our elected and non-elected public officials to act honestly and with integrity. However, in far too many cases, personal self-interests, greed, and abuse of power have resulted in increasing calls for government reform. The focus of these reform efforts emphasizes creating an administrative environment that ensures government officials act in unity with society's basic notions of ethics and probity. Regulatory changes impacting such aspects as political party financing, rules governing administrative discretion, and how citizens interact and access government are all meant to ensure public officials are held accountable for their actions.

## What Is Accountability?

Accountability is an amorphous concept that has been defined in a multitude of ways. Although Merriam-Webster (2015) defines accountability as "an obligation or willingness to accept responsibility or to account for one's actions" (http://www.merriam-webster.com/dictionary/accountability), scholars have debated and pushed the examination of the issue of accountability to the forefront of governance. Since the epic Friedrich-Finer debate of the 1940s about the most effective way to ensure accountability of public officials in a democratic system, the overarching questions of *who* is accountable and *what* are they accountable for still remain largely unanswered (for an interesting discussion of the debate, please see Stewart 1985).

Broadly speaking, accountability exists when there is a relationship between an entity (such as an individual, group, or institution), which is subject to another's oversight or direction, where they provide information or justification for their actions. Under this conceptual lens, accountability involves two distinct groups: an agent and a principal. Therefore, government functions as the agent for its citizens, through public officials and agencies. Moreover, as an agent for the citizens, government must continually provide information

G

about their decisions and actions as justification to the citizens and those institutions charged with ensuring that the agents are accountable for their actions. Oversight suggests that the public, or those institutions tasked with ensuring accountability, can sanction the government or remedy the violating behavior. The rise of accountability has lead to an increase in auditing, supension, and monitoring (Michael 2005).

The fundamental basis for government acting as agent for its citizens is the concept of the social contract, where the social contract establishes the values society wants to enforce. In a democratic society, the social contract involves the retaining of certain natural rights, an acceptance of restrictions of certain individual liberties, the assumption of certain duties by both the governed and governing, and the merging of certain powers to be exercised collectively. *What* governments are accountable for is articulated in national and subnational constitutions and the subsequent legislative policies and administrative procedures created to implement those constitutional values.

The relationship between the governed and the governing manifests itself within the responsibility of elected and non-elected officials to act on behalf of society. Therefore, public officials have a responsibility to explain their decisions and actions, and they are held accountable for those decisions. Accountability is represented through the use of administrative structures (traditionally through legislative, judicial, and administrative structures) and administrative processes (transparency, access, oversight, and legal address) that are established to safeguard that elected and non-elected officials are answerable for their actions. When a public official violates some given constitutional or regulatory norm, such as embezzling public funds, new accountability requirements are created, which requires even more checks and balances to limit this type of fraud. Within this legalistic approach, governments create more regulations attempting to control behavior, which typically result in more red tape. Yet red tape does not ensure that government officials act ethically.

The traditional legalistic concepts of what government officials are accountable for overlooks the moral, professional, and ethical dimensions of accountability and focus on creating a regulatory environment that promotes legal and fiscal control. These controls are evident with increasing levels of red tape, which in turn creates even more opportunities for public officials to act unethically. Although this may seem counterintuitive, the increasing number of rules and regulations (red tape) necessary to limit corruption makes the system even less transparent. For example, the Federal Acquisition Regulation (FAR) establishes how the federal government acquires goods and services essential for delivering public services for the Department of Defense, the General Services Administration, and the National Aeronautics and Space Administration. It contains over 2000 pages of regulations that have been variously labeled as "intractable," "overwhelming," and "impossible for any one person to understand" (2015). Only certain individuals possess the knowledge and skills necessary to weave through the complex accountability structures.

## New Public Management and Accountability

The evolving and expanding nature of modern government has questioned the efficiency and applicability of conventional political-administrative, superior-subordinate relationships under close supervisions with increasing rules and regulations (Romzek and Dubnick 1987a). Within a modernization framework, accounting for one's actions or pinpointing responsibility becomes obfuscated. More so, with varied interconnected relationships in a market-oriented environment, it becomes difficult to determine who is accountable and precisely what they are accountable for.

Through modernization and ideals of market-oriented management, privatization, originally a mechanism for maximizing economic efficiency by increasing the scope and quality of service, functioned as a solution to outsourcing accountability. However, contracting out, coupled with additional third-party contractors, has created

"nongovernmental governance," lacking the formal institutions of the state (Milward and Provan 2000). The autonomous nature of these relationships questions the responsibility of accountability. More so, varied or convoluted relationships enable organizations to carry out government business without visibility or accountability (Gilmour and Jensen 1998). A stealth mixture of government and third-party administration develops through the combination of nonprofit organizations, along with a network of providers. The desire for greater cost-efficiency for governments instead functions as a curtain for accountability. These varied relationships blur the ability to identify responsibility, questioning accountability by failing to identify *who* is accountable and *what* they are accountable for.

## Third-Sector Accountability

Along with the growth of nonprofits, cooperative organizations muddy the waters even further by providing additional layers of "bureaucratic undermining" adding to the complexity of accountability through the blurring of responsibility. With unclear relationships, historical notions of principal agent accountability are no longer applicable. Still the question arises: when decision-making authority is delegated to the agent, does responsibility and accountability transfer as well? (Jensen and Meckling 1976, p. 308). Additionally, when agents are self-serving and economically motivated, who should be ultimately accountable, the principal or the agent? Because decision-making involves multiple actors, public authorities are no longer assumed to possess the traditional authority ascribed to public organizations (Hansson and Longva 2014, p.93). Monolithic growth has expanded governance to include any business of the public, no matter the degrees of separation. Therefore, the notion of citizens holding elected officials accountable is challenged (Hansson and Longva 2014, p.93). Traditional notions of transaction cost economics (Williamson 1973) previously dictated the decision for in-house services versus contracting out. The lure to produce and achieve efficiency continued the growth of government, further questioning conventional notions of accountability. With the expansion of individuals, agencies, and sometimes governments involved, accountability becomes difficult because of the many layers burying who is accepting responsibility and accounting for one's actions.

Contractual agreements are paving the roads of accountability, specifying what and whom – relying on the level of specificity, between parties with divergent interests. Furthermore, even though contractual relations do not include formalized channels of accountability to citizens, the satisfaction of public services is also impacting the judgment of the final product, shifting to evaluation of outcomes and performance. Governance requires more than what public service delivers, and it must include the processes as well as the mixture of inputs (Dubnick 2005). Therefore, the means and ends function as measurements of effectiveness; however, they fail to demonstrate a mechanism for ensuring accountability.

Moreover, technology has brought forth a surplus of benefits, along with an array of challenges. E-governance contributes to greater transparency and has the potential to aid in the notions of accountability by providing linkages for responsibility. However, with the mass-produced and ever expanding availability of information, challenges to accessibility still remain. Furthermore, accountability through e-governance remains tied to integrity, impacting the overall public perception, specifically within an "environment of blameworthiness" (Dubnick 2005). The ability to pick and choose the specific information available, deciding between supporting reports as opposed to effectiveness measures, contributes to the frustration and overwhelming breadth of information present. Finally, the desire to inundate information availability has overshadowed the need for a coherent exchange of dialogue among stakeholders (Dumont 2013), further exacerbating Ebrahim's (2009) conclusion that transparency is a key component of accountability.

## Conclusion

In summary, unhappiness with the status quo leaves hierarchical and accountability for processes failing to achieve the level of governmental accountability desired (Heinrich 2002). Moreover, technology and advancements bring forth expanding notions of government employees and officials, increasing those conducting public business and, in turn, impacting accountability. Accountability within the public sector defines the philosophies of democracy (Romzek and Dubnick 1987b). Furthermore, accountability discussions aim at promoting behaviors that are socially or legally legitimated. Failing to live up to the public expectations, through mismanagement, unethical or corrupt behavior breaks down accountability from the foundations. Through the distribution and devolution of power to nontraditional government employees, accountability has taken a back seat. Together with information overload, specialized experts and specific areas of expertise conflate accountability on all levels. Relying on performance measurements for accountability, dispersion and empowerment are justified and endorsed. As accountability is defined as "accepting responsibility or accounting for one's actions," it is important to be able to identify who is accountable and exactly what they are accountable for (Merriam-Webster 2015). Privatization provides support for "doing more with less" while circumventing government incompetence and avoiding "rule-bounded inflexibility" (Ott and Dicke 2001, p. 322), further convoluting the identification of responsibility and accountability. With the presence of increasing challenges and opportunities, scholarship and practice can achieve the greater accountability envisioned within governance.

Regardless of who provides the service, those in governments are responsible for balancing citizens' needs with public outcomes. Varying structures with diversified relationships presents the growing need for accountability, along with the challenges. Recognizing and addressing the evolving nature of governance will help researchers, as well as practitioners, achieve a better level of accountability in the future.

# Governmental Reform in Turkey

Can Umut Çiner[1] and Bilge Uz[2]
[1]Faculty of Political Sciences, Ankara University, Ankara, Turkey
[2]Ankara University, Ankara, Turkey

## Synonyms

Governmental reform; Presidential system; State reform

## Definition

The Republic of Turkey has put into practice one of the most important changes in its history with respect to its constitutional and administrative system on February 11, 2017. Turkey has changed the governmental system from parliamentary to presidential system through a long process that was initiated by the constitutional changes of 2007 and ended with latter arrangements such as Law No. 6771 as a final part of the changes. With these changes, the new arrangements aimed at harmonizing the new constitutional items with the existing administrative structures. Since the system is recently put into practice, it is not possible to conduct a policy analysis other than legal text analysis which constitutes a limitation of this entry. The aim of this entry is to examine this last cycle of the administrative revolution and to explain, in the simplest possible way, the elements and the implications of the changing structure brought with the Presidential system.

## Introduction

Existing studies on Turkey's administrative system and administrative law are now out of date. As the fields other than territorial organization have changed from top to bottom, we are at a time when even academic experts in the field find it difficult to follow and map out the changes. This period is marked by deep political and social transformations due to practices during the state of emergency period and the ongoing economic crisis. Therefore, the changes introduced along with rapidly implemented several regulations, all of which are quite extensive for transforming the system of government and the administration structure, should be considered within Turkey's unique conditions. However, these conditions will not be mentioned since they exceed the limits of this entry. In addition, it is not possible to survey the elements of the building blocks of the new system in practice since the adaptation of the bureaucracy to this new situation has not been yet completed. This entry is a one of the first stabs at mapping out the changing structure. Undoubtedly, like in the case for any dynamic phenomenon, this entry may potentially get out of date soon after it is penned.

Turkey has a long-established state tradition based on a parliamentary system. The parliamentary administration structure has been changed with the general elections of June 24, 2018 which took place after the constitutional amendment in 2017. The previous system was changed with a new administration system called the Presidential Governmental System.

In Turkey, the former system was a pure parliamentary system as the powers of the president had no significant effect on the overall system. This was because the use of power by the president depended on the rule of counter-signature of the council of ministers (Gözler 2018a). In the former structure, the constitution granted broad powers to the president. However, it is accepted in the doctrine that the president cannot be regarded as a head of administration and part of the central government given the impartiality of the president, the requirement of dismissal from her/his party in case of selection, and the irresponsibility of her/his actions (Duran 1982). It is also accepted that the President is an actor, who is outside the executive body and only in close relations with the administration (Gözler 2018c). The President is considered as a driving force and is an executive head overarching. The prime minister and the council of ministers are responsible for the overall administration of politics in the country (Günday 2017).

The academic literature has yet been developing about the changing governmental system in Turkey. Apart from a few analyses in Turkish, the analysis of this system in the English-speaking world is limited to newspaper articles (Gur 2017; Yılmaz 2018) and brief political assessments. Therefore, on the one hand, the literature offers a perspective that gradually dissolves the difference between government system discussions and regime change. This fact necessarily makes it difficult to monitor the changes realized under the name of the government system because it means making a political assessment without understanding the spirit and purpose of new developments.

## Transition to the New System

The transition to the new system in Turkey was realized with the Law No. 6771, after numerous adaptation arrangements made to reflect the constitutional changes in the existing administration structure. Following the amendments, the executive power and responsibilities of the president and the council of ministers in the former system are gathered at the president "'who was directly elected by public vote." The council of ministers, a body responsible for and against the legislative power, and the prime ministry, which coordinates this system were all abolished. In this sense, the relationship between the legislative and the executive powers are redrawn (Ardıcoğlu 2017).

In the new system, the executive body is monist and consists of only the president (Gözler 2018a). The establishment, abolition, duties, and powers of ministries; organizational structure; and the appointment of senior executives are regulated by the Presidential Decree in accordance with the new constitutional provisions.

The Presidential Decree, which is the basic regulatory mechanism of the system, does not have a clear definition in the Constitution. On the other hand, it can be defined as a regulatory instrument for the exercise of executive power, which is formed by the signature of the President and can be issued without authorization of TGNA. In this sense, it can be considered that the Presidential Decree is more than an ordinary administrative act, which has a legislative power. Granting the president the authority to issue law-making decrees is similar to that of the Decree-Law issued to enable the executive power to take quick decisions in parliamentary systems (Karatepe et al. 2017). However, in the system, it is noteworthy that the authority of the president to issue decrees is limited to executive affairs (Gülener and Mis 2017).

## The Presidential Organization: Building Blocks of the System

The Presidential decrees bring comprehensive regulations, which have the force of law, are very comprehensive and regulated by law. Within this scope, the Presidential Decree No.1 regulates the structure of the central organization of the Presidency, the institutions and organizations affiliated to the Presidency, the policy boards, and the working procedures and principles of offices and ministries.

## Policy Boards

The Policy Boards are composed of three persons. The President is the chairman of these boards and appoints one of the board members as vice president. Main duties of these boards are to develop recommendations on decisions and policies taken by the president.

The policy boards carry out the necessary work on the policy and strategy proposals deemed appropriate by the President. They monitor the implemented policies by taking the opinions of the relevant parties and report them to the president. In addition, some of the tasks of the policy boards are giving opinions to the public institutions and organizations related to their field of activity, monitoring, and reporting the activities of the ministries and institutions in terms of compliance with the President's program, conducting extended board meetings with the participation of related parties, and making an impact analysis of requests and needs related to their field of activity.

There are nine Policy Boards established by the Presidency by decree. The Boards are named as "Policy Board on Science, Technology and Innovation," "'Policy Board on Education and Training," "'Policy Board on Economic Policy," "'Policy Board on Security and Foreign Policy," "'Policy Board on Legal Policy," "Policy Board on Culture and Art," "'Policy Board on Health and Food," "Policy Board on Social Policies," and "'Policy Board on Local Government."

Policy Boards work directly with the President in relation to their fields of duty and follow instructions of the president. The ministries, public institutions and organizations, civil society and private sector representatives, academicians, and local or foreign experts can be invited to the meetings and studies related to the duties of the Boards. The issues that fall under the duties of more than one board are jointly studied and joint decisions formulated by the related boards in the expanded board meetings.

Policy Boards work in close cooperation with the ministries, the public institutions and organizations, the enterprises, and institutions that have similar characteristics with public institutions. The boards may request all kinds of information and documents related to their field of duty from ministries and public institutions and organizations. The Secretariat of the Policy Boards is carried out by the Administrative Affairs of Presidency.

Considering that the Policy Boards were established to carry out similar functions as the auxiliary and advisory boards such as the National Education Council, the Health Council, the High Planning Council, and the High Council of Science and Technology, it can be argued that they may serve as an auxiliary organization or advisory body (Gözler 2018c).

## Presidential Offices

Presidential Offices are the units attached to the Presidency to perform a set of preassigned duties. Offices have special budgets, public legal personalities, and have both administrative and financial autonomy. The "Digital Transformation Office," "Finance Office," "Human Resources Office," and "Investment Office" operate in areas requiring technical expertise. Offices expected to play a critical role in the development of technical projects that will be the basis of policies (Turan 2018).

The head of the Office is the highest authority of the office and is responsible to the President for the general management and representation of the office. The head of the Office manages the office, of which he is in charge, in accordance with the objectives, policies, and strategies set by the President. The organization of the offices consists of main service units and advisory and auxiliary service units. Offices authorized to coordinate all institutions and organizations in the issues within the scope of its duties and to hold meetings or to organize other activities required for the purpose of coordination. With the latest Presidential Decree (No: 48 issued on October 2019), the organizational structure and the functions of the Offices are regulated. Decree set out that the organizational structures of the Offices as in the Ministries, such as Departments, regional, and foreign organizations and standardized all of them in this sense. As the Decree states that the Offices has a direct official relationship with the President and has the authority to prepare legislation on their related areas, we can argue that the Offices are above the Ministries in the governmental hierarchy in the new system. Nevertheless, since the Offices are quite newly formed bodies, we need to pursue their implementation processes on practice.

## Ministries in the New System

Although there is no council of ministers and prime minister in the new system, the ministries continue to exist. However, they are very different from the ministries in the old system. In the old system, the ministries, as a part and essential element of the executive power, constituted a collective structure: the council of ministers. Under the chairmanship of the prime minister, who was herself a minister, the council of ministers, in other words the government, was the competent and responsible element of the executive body. After the amendment in 2017, a collective organ that gathers the ministries is not being formed. The principle of equality, not

hierarchy, applies as a rule between ministries (Gözler 2018b; Zengin 2019).

In the new system, the ministries are not responsible to the legislature, but to the president. The ministers are appointed and dismissed by the president. They are not partners of executive power. The main element and leader of executive power in the system is the president. In this sense, ministries are service units responsible to the president (Gözler 2018a). Since the ministers cannot exercise their executive power in the system, they serve under the president. In the system, the president is the hierarchical head of the ministers (Ardıcoğlu 2017). The number of ministries has been reduced to *16* from *21*. With the Decree, some ministries have been merged and some have been abolished. For example, the Ministry of EU Affairs was abolished and was structured as a unit within the Ministry of Foreign Affairs. The Ministry of Family and Social Policies and Ministry of Labor and Social Security were united under the name of "Ministry of Labor, Social Services and Family"; the Ministry of Development and Ministry of Science Industry and Technology were merged under the name of "Ministry of Industry and Technology"; The Ministry of Economy and the Ministry of Customs and Trade were united under the name of "Ministry of Trade." The Ministry of Food, Agriculture, and Livestock and the Ministry of Forestry and Water Affairs brought together as "Ministry of Agriculture and Forestry." The Undersecretariat of Treasury was included in the structure of the "Ministry of Treasury and Finance." Thus, the scope of the ministries was narrowed in terms of their personal and organizational structures through bringing together the service ministries operating in similar fields. This also demonstrates the standardization of the policy-making structures in similar areas on taking and implementing the same decisions.

With the Decree, the organizational structure of the ministries became uniform under the same regulations. The decree applies to all ministries and it stipulates that the ministries are composed of "central organization, provincial and foreign organizations, and affiliated organizations established according to the needs." Accordingly, the central organization of the ministries consists of hierarchical levels organized under the minister, deputy minister, general directorates linked to the deputy ministers, head of the committees, and departments (Gözler 2018b).

## Independent Institutions and Organizations

The Presidential Circular No. 2018/1 published on 15 July 2018 linked affiliated and related institutions to the ministries that are shown in relation to these institutions in list of the circular. It has stipulated that the affiliation and relevance, status of the institutions, and organizations that are not included in this list have specified in the related laws or Presidential Decrees.

Within the institutions in the scope of the list, while the Saving Deposit Insurance Fund, the Personal Data Protection Agency, and the Human Rights and Equality Institution of Turkey are related to the Ministry of Justice; the Capital Market Board, the Banking Regulation and Supervision Agency, which are among the regulatory and supervisory institutions, are related to the Ministry of Treasury and Finance. The independent institutions and organizations, which had independent decision-making and functioning mechanisms and whose relations with the central government were more distant in the previous system, have been directly involved within the Presidency or a ministry and have been included in the central administration system similar to other public institutions. At this point, this means that the centralized administration has been more expanded in comparison to the previous system, and that all public institutions are brought as close as possible to the center, being directly involved in the political decision-making process.

## Conclusion

In Turkey, the parliamentary system, the state tradition based on this system, and the administrative structure running approximately for 95 years have been entirely changed. The old

system was transformed into a new presidential system, which is a unique administrative model for Turkey. The most fundamental change brought by the new system in terms of public administration is the strengthening the central administration system through broad powers granted to the president, who has the executive authority. This means that the legislative and the judicial powers are conspicuously weaker. In this respect, in the new system, executive decisions can be taken by the President, as the head of administration. The powers of the president have been increased and the scope and area of implementation of presidential decisions have been expanded. It is possible in the exercise of this authority that the administrative procedures and possessions of the ministries and independent institutions shall be directed by the policy boards and the offices.

Within this scope, the coordination role of the central administration and decision-making process, which was previously carried out by the council of ministers and the prime minister, have been transferred to the policy boards and offices in the new system. In this sense, the central government is included in the policy making process with all its units and it becomes the implementer, as a whole and in the fastest way, of the decisions taken by the president. Since it is also possible to direct the system by introducing changes with the presidential decrees on the processes of set up and implementation of the new system, it is foreseen that the necessary changes can be made by administrative decisions whether there will be administrative or executive difficulties. This aspect suggests that the new system in Turkey will reshape in practice. Furthermore, whenever there will emerge systemic implementation difficulties, the new system will gradually converge onto a parliamentary system.

# Greek Refugee Crisis, The

Nikolaos Zahariadis
Department of International Studies, Rhodes College, Memphis, TN, USA

## Synonyms

Greece; Immigration policy; Refugee crisis; Schengen agreement

## Definition

*Refugee policy* consists of measures taken by governments to regulate the transit across national borders of those people fleeing persecution or open conflict at home.

## Introduction

Efforts to address the refugee crisis in Greece (2012–2016) have mostly failed to produce the desired results with few prospects for improvement in the future. The complexity and transnational nature of the refugee issue coupled with austerity and lack of administrative capacity in

Greece pose nearly insurmountable problems to effective policy and implementation. The refugee crisis is important not only because it has received inadequate scholarly attention so far but also because at its core, the Syrian crisis represents what António Guterres, the UN High Commissioner for Refugees (UNHCR), claimed to be "the biggest humanitarian emergency of our era" (Edwards 2014). By the end of 2015, 1,015,078 migrants had crossed the Mediterranean into Europe rendering it the biggest movement of people in Europe since World War II. Of those, 3771 died (most drowned) in the process (UNHCR 2016). Moreover, the case deeply affects the Schengen Agreement, which is the current policy of free movement for persons across Europe.

## Migrants, Refugees, or Irregulars?

Since 2005, Greece has been an important first European Union (EU) country of arrival for migrants and refugees heading west to northern Europe. Perhaps the biggest obstacle with dealing with the influx of people across the Mediterranean has been language. Who are they and how should they be called? Labels matter because different rules apply to asylum seekers, legal (and illegal) migrants, and refugees. Asylum seekers are those who can demonstrate legitimate fear for their physical security in their home country. Legal migrants are those who obtain papers in their place of origin to migrate to the host country usually for economic or family reasons. Illegals cross national borders without papers for economic or other reasons. Refugees cross national borders legally or illegally because they flee armed conflict or persecution (IOM 2016a). Some experts use the term irregular migration to refer to sometimes temporary entry, residence, or work in a country without the necessary authorization or immigration documents; these migrants often fall prey to human smugglers (Triandafyllidou and Maroukis 2012: 5). The problem with the persons crossing the Mediterranean is that they are all of the above in many cases, making policy complex and difficult (in trying to document the undocumented), time consuming (in keeping records and distinguishing between criminal and legitimate elements), and highly contentious (in verifying who has legitimate fear of persecution at home). This article will use the generic term migrant and differentiate between types in the appropriate context.

## Why Greece?

An overview of flows of legal and irregular migrants and asylum seekers in 2015 shows that approximately 11.3% of Greece's total population are foreigners (IOM 2016b). However, the flow and sources of migrants have changed substantially over the years. Whereas the number of migrants crossing the Greek border has waxed and waned, it skyrocketed to almost ten times the average in 2015 (see Fig. 1). Moreover, there has been a shift between 2010 and 2014 from sea to land and back to sea since 2015. The majority of migrants used to arrive in Greece by boat mainly from Pakistan, Bangladesh, Iraq, and Afghanistan and by land through Albania and Turkey. Sources of migrants changed substantially in 2012 when Syrians broke in the top five nationalities of legal and illegal crossings. Fully 46.15% of all apprehended illegal migrants in the first 5 months of 2016 came from Syria, while the second largest group (23.9%) came from Afghanistan (Greek Police 2016).

The reasons for these shifts are highly complex and vary over time. Using the push-pull model of migration (Massey et al. 1998), we can track several reasons for mobility. On the pull side, the large influx of migrants from Albania and large parts of Asia and Africa prior to 2010 saw Greece as the gateway to the European Union (EU). Economic reasons propelled the majority of Albanians, Somalis, Palestinians, and Pakistanis to seek a better future in the EU. On the push side, many refugees made the perilous journey across Turkey to seek asylum in Greece, fleeing persecution and civil war in Afghanistan and Iraq. The ultimate hope was to take advantage of open borders within much of the EU (more precisely those countries which participate in the Schengen

**Greek Refugee Crisis, The, Fig. 1** Number of apprehensions of illegal migrants crossing into Greece according to data from Greek Police (Land and sea) * January–May 2016. (*Data Source*: Greek Police (2016))

Agreement) to move over time to other EU countries.

## Why Now?

The situation, however, changed dramatically in 2012 for three important reasons. First, Greece tightened immigration procedures and brought drastic changes in detention and repatriation policies. Stung by a European Court of Justice decision in 2011, which found that 90 percent of all irregular entry into Europe was through the Greek borders (IOM 2016b), the Greek government began implementing more stringent detention policies and tightened security at the borders. The latter involved seeking assistance from Frontex, the EU's external border forces, to patrol sea routes in the Aegean (many Greek islands are just a few miles off the Turkish coast). Following the path of least resistance, crossings changed from sea to the land border with Turkey along the Evros river, where a security fence was constructed to dissuade migrants from coming. In addition, a bilateral visa agreement reduced the flow of illegal migrants from Albania. However, detention and repatriation policies became stricter to more closely follow EU directives and the Dublin II treaty, which deals with immigration in the EU (McDonough and Tsourdi 2012). The end result was a reduction in the flow of migrants with many of them going underground to avoid capture and repatriation by police and border patrols. Most of them, in other words, ended up stranded in a country in which they did not necessarily want to be raising the prospect of social tension.

Second, the economic crisis and consequent austerity measures had a significant impact on Greek policy. As the economy dove into a tailspin – Greek real income has fallen by more than one-fourth since 2009 and unemployment soared to more than 25% in 2012 (Zahariadis 2015) – social and political good will be evaporated. The far-right political party Golden Dawn capitalized on social discontent and set up food banks but only for Greek citizens. Despite initially showing solidarity with refugees, small communities quickly turned because they did "not wish to see the establishment of [relocation] camps in their neighborhoods/regions which have every chance of becoming permanent" (Economides quoted in Gill 2016). Moreover, government policy was heavily criticized for maintaining

inappropriate conditions in detention camps and following arbitrary and irregular repatriation policies.

Third, geopolitical developments in the region, especially the implosion of Qaddafi's regime in Libya and the civil war in Syria, reshuffled routes and sources of migrant origin. Italy bore the brunt of refugee waves in 2012–2013 largely following the deteriorating situation in Libya. However, as Syria's war intensified and as the number of deaths increased among those crossing the Mediterranean, refugees began seeking alternative and safer routes through Greece.

## Crisis Within a Crisis?

The year 2015 marked a turning point in migrant flows. A new government in Greece and heavy bombardment by Russian planes in Syria precipitated a mass exodus of Syrians seeking asylum in neighboring lands and in Europe. The Greek radical left-right coalition government clearly signaled a change in policy. The minister in charge of immigration, Tasia Christodoulopoulou, noted the government's intention to stop indiscriminate detentions, gradually releasing asylum seekers and illegal migrants that have been detained for long periods. The point was to follow a more humanitarian approach and offer alternatives to detention, such as open shelters, voluntary returns, and integration programs. Unfortunately, the government lost control of the situation as the numbers of refugees arriving from the Turkish coast surpassed every expectation. Indicative of the magnitude of the problem is the simple fact that in July 2015 alone, Greece received more refugees than the entire previous year. Moreover, the government proved unprepared and unable to find and fund alternative accommodations. Hundreds of thousands of refugees were left to fend for themselves in the streets of Athens and other big cities, while many residents of Greek islands bitterly complained of the lack of state administrative capacity, suitable accommodations, planning, and funding (Tagaris 2015). By August 2015, the UNHCR described the situation in the Greek islands as "total chaos" with completely inadequate accommodation, water, medical, and sanitation infrastructure (BBC 2015).

### The EU Steps In

Despite initial trepidation to concede failure, Greek Prime Minister Alexis Tsipras finally admitted Greece's inability to cope with the refugees calling the situation "a humanitarian crisis within a crisis" (Kambas 2015). After seeking EU help to address the problem and encountering stern reprimands for lack of infrastructure, preparation, and administrative competence, he made the decision to ease the strain on resources by transferring refugees to the Greek border *en route* to other European countries. The decision ended up being the straw that broke the camel's back.

On the one hand, volunteers filled the void left by government paralysis. This helped the situation but also generated confusion and disillusionment. Volunteers in many islands were able to man posts, welcoming refugees and transferring them to the main ports to be shipped to the mainland. But the initial ad hoc response eventually gave way to more professionally run networks of responders, such as the International Rescue Committee and Médecins Sans Frontières, stabilizing a precarious situation (Hernandez 2016). The problem was that the uneven registration process left huge gaps for criminal elements to slip through. Indeed, although all perpetrators of the Bataclan massacre in Paris in November 2015 are believed to have been EU citizens, two of the attackers posed as migrants to enter Europe through Greece using fake Syrian passports. More recently, the Afghan teenager who went on a slashing spree on a train in southern Germany in mid-July 2016 was an unaccompanied asylum-seeking minor. These and other incidents have raised fears that the waves of refugees and Greece's inability to stem the flow increased the risk of terrorist elements going undetected.

On the other hand, the incredible numbers of refugees walking their way to Germany and other countries in central and northern Europe prompted robust actions by several EU states. The

EU's collective failure to draw up a coherent strategy to deal with the huge movement of refugees illustrated in vivid terms Olson's (1965) well-documented impediments to collective action. As a result, individual member states unilaterally renationalized the EU's immigration policy. Up to October 2015, refugees made their way through member states relatively freely until they reached Germany where they sought asylum. At the same time, EU leaders tried to reach an agreement to allocate refugees among different member states. The sheer numbers, however – Germany was due to receive over 800,000 refugees in 2015 – raised suspicion among some governments that they would be stuck with what they considered to be unwanted trespassers. Hungary was the first to close its border to new migrants followed by a domino effect of other border closures reaching all the way south to Greece. As a result, Greece was stuck with hundreds of thousands of destitute and hungry refugees who kept on coming, did not want to stay, could not leave, and refused to go back. Any thoughts Prime Minister Tsipras may have entertained to use the refugee crisis as leverage to pressure EU creditors to ease up on imposed austerity proved to be misleading.

### The EU-Turkey Agreement

After months of negotiations, the EU finally struck a deal in March 2016 among member states and Turkey (Collett 2016). Turkey agreed to stem the tide of refugees flooding Greek shores in exchange for financial aid (€6 billion over 3 years, €3 billion more than what it was offered in October 2015), easing of EU visa controls, and accelerated negotiations for EU membership. Greece agreed to let NATO forces patrol the Aegean in search of refugee boats, stop prompting migrants to leave for other EU states, and build reception/registration camps ("hotspots") in the islands and relocation camps in the mainland that could provide adequate housing for thousands of refugees who waited to have their cases registered and assessed. Asylum seekers (normally from Syria) would receive priority, while the majority of remaining nationalities arriving after March 20, 2016, would be voluntarily or forcibly expelled to Turkey or repatriated to their country of origin. In the meantime, EU member states would have to agree on a formula to welcome migrants among themselves.

The agreement was met with substantial criticism by NGOs, international organizations, and some EU states (Collett 2016). Some NGOs and more spectacularly the UNHCR ceased operations in the Greek islands (but the UNHCR later returned), complaining the agreement did not do enough to protect the rights of refugees while forcible repatriation violated EU and UN principles. Others complained that Turkey did not provide enough safety protection to repatriated individuals, while still others thought the agreement did not do enough to address the causes of refugee movements.

## What's Next?

The situation remains precarious at the time of writing (July 2016), limiting Greek, and more generally EU, options (Lamb 2016). While the flow of refugees has stopped, all those interviewed (nine individuals from local and regional governments, volunteers, and academics) in the island of Lesvos (June 2016) expect it to fail. They believe the flow will resume once the weather improves – indeed refugee boats began to arrive again in June but not in the extreme numbers recorded in 2015. Moreover, Greek people feel abandoned by the Greek government and the EU because the economic crisis continues unabated while tourism has suffered dramatically in select islands affected by refugee flows, such as Lesvos, Kos, and Chios. This is all the more intriguing because islanders benefited enormously by the presence of paying volunteers in the non-touristic winter months – many volunteers have since left in protest or because of lack of incoming refugees. The situation in Turkey is precarious following the attempted military coup and the government's crackdown on judges, the military, academics, and generally civil servants. To make matters worse, the British decision to leave the EU

has also emboldened nationalist and xenophobic political parties in other countries, notably Hungary, France, Poland, Austria, and the Czech Republic, to block any EU-mandated refugee allocation scheme. Finally and in the absence of addressing the Syrian crisis, which may bring refugee numbers down to more manageable levels, it is highly likely that human waves of the destitute, desperate, and poor will continue to flood EU shores. The EU policy of open borders promised by the Schengen Agreement is likely to be revisited.

## Conclusion

The case demonstrates the value of Castles' (2010) argument that migration reflects significant social transformation brought about by what Hollifield (2008) hypothesizes is complex government policy calculations. Greece is the prime example of a society socially and politically transformed by extraordinary waves of migration. The case also reveals the power of migration as a political tool for affecting European discourse and reversing (or having the power to potentially reverse) transnational (EU) integration. The issue's complexity and the lack of political will amidst austerity coupled with poor administrative capacity have proven to be serious impediments to policy effectiveness.

## Synonyms

Climate conservation; Environmental change; Environmental procurement

## Definitions

| | |
|---|---|
| Green procurement | It is the consideration of the environmental, social, and economic consequences of design, materials used (renewable and non-renewable), manufacturing methods, logistics, and disposal. This is based on the belief that institutions can simultaneously benefit from all the three elements – economics, environment, and society – which are seen as vehicles for value creation. With this consideration, the negative environmental impacts of government operations are reduced while greening goals are promoted through integrating ecologically responsible practices as part of the government's commitment to improve the quality of life of its citizens. In this regard, it focuses on procuring goods, services, and works with reduced ecological impact throughout their life cycle when compared to goods, services, and works with the same primary function that would otherwise be procured. |

## Introduction

In recent years, we have witnessed a surge in global attention to environmental consciousness. Societies are meeting their needs for goods, services, works, and utilities in a way that achieves value for money on a whole life basis in terms of generating benefits not only to them but also to society and the economy, while minimizing damage to the environment. This is motivated by planet earth experiencing a severe crisis originating from various environmental problems such as natural resource depletion, global warming, and biodiversity loss. There is a concern over the likelihood that the environment will degenerate due to urbanization, population growth, economic growth, intensification of agriculture, increase in energy use, and increase in transportation, among others. Branded with different names – green industrialization, low-carbon industrialization, green economic growth, cleaner production, resource efficiency, sustainable manufacturing, and a number of others – the agenda to promote environmental awareness among procurement institutions has become critical both in research and practice. This has highlighted the need to promote procurement awareness in avenues such as industrial use of natural resources and ethical sourcing of labor and raw materials and the environment.

Green procurement activities in both the public and private sectors take four main approaches: procuring eco-labeled products or services, in-house product/service evaluations, third-party product/service evaluations, and supply chain initiatives. For example, in sub-Saharan Africa, the increasing demand for low carbon production and supply (procuring eco-labeled products or services) is emanating both from an increasingly environmentally conscious consumer and through political will to combat climate change. These are of great importance to

national and international biodiversity conservation and contribute numerous benefits (e.g., tourism revenue, water catchment functions, and provision of energy, food, employment, and income) for local communities. Yet, the estimated loss of high conservation value forests in Uganda is 900,000 hectares each year which constitutes 60% of the high conservation value forest loss in all of Uganda. Take a look at the production of charcoal for heat energy accounts for 80% of this loss while rampant felling of trees for firewood accounts for 5%.

The concept of green procurement seems to be a bit fuzzy in literature. For example, it has been used by some scholars to refer to purchasing of products and services with specific attributes such as energy or water efficiency or the use of bio-based or recycled materials or nontoxic chemicals, without necessarily taking other factors into account. However, not all scholars agree with this thinking. As a result a number of variations in meaning for the same concept exist. For example, some scholars define "green procurement" (formerly known as affirmative procurement) as the purchase of environmentally preferable products and services in accordance with one or more of the established "green" procurement preference programs. The typical green procurement program elements are recycled content products, energy-efficient products and energy-efficient standby power devices, alternative fuels, bio-based products, non-ozone-depleting substances, fuel-efficient vehicles, and environmental protection priority chemicals. Such variations seem to have created significant conceptual difficulties for both scholars and policy makers in the public and private sectors.

Irrespective of this conceptual vagueness, green procurement focuses on environmental conservation and economic and social development worldwide so as to promote the green procurement remediation to prevent contaminating soil, water, and depositing sediment. Particularly, green procurement awareness aims at reducing environmental risks and impacts, achieving greater profitability, better market share, and increasing their eco-efficiency. This is in line with the government's hopes of addressing the current heavy dependency on natural resources which is attributed to limited access to sustainable and renewable energy technologies through the use of Biogas and Lorena stoves across the country.

In Uganda, the government has demonstrated commitment towards the principles of green growth and sustainable development as indicated in various legal, policy, planning, and institutional frameworks. This is in line with the Uganda Vision 2040 aspiring to transform Uganda from a peasant to a modern and prosperous country by 2040 through strengthening fundamentals to harness existing environmental procurement opportunities. Consider the ongoing improved sustainable water resources that are accessed through valley tanks and community boreholes especially to the pastoral Ugandan communities. It further acknowledges that green growth is the approach desired for the implementation of sustainable development and wealth creation. Similarly, the second National Development Plan 2015/2016–2019/2020 (NDP II) seeks to strengthen Uganda's competitiveness for sustainable wealth creation, employment, and inclusive growth and achieve lower middle-income status by 2020 with a per capita income of US$ 1,039.

However, regardless of the several legal provisions that the country has adopted, there is a current debate regarding the degree to which Uganda's local governments have adhered to the needed practices of green procurement awareness. This raises concerns about whether the economic growth is attained at the expense of the environment and natural resources. National forest coverage as a percentage of the total land surface area declined from 24% in 1990 to 14% in 2015, while national wetland coverage as a percentage of the total land area declined from 15.6% in 1994 to 8% in 2014. The impacts of climate change have also plagued Uganda in the form of intense and more frequent prolonged droughts, torrential, and poorly distributed rainfall and a rise in temperatures, as demonstrated by a significant reduction in the volume of glaciers on Mount Rwenzori. To contain these impacts calls for a novel development approach that can sustain the economic growth while improving the social and

environmental development targets as demonstrated in the case of Mr. M below.

## The Case of Mr. M

When Mr. M rose to the mayorship of Rukungiri, he inherited a municipality characterized with hazardous and pollutants such as chemical materials and products which increased the risk of environmental contamination. Uncontrolled wastes could litter everywhere on the streets, verandas, and any other open places and ended up being deposited in human and animal food supplies. This was thought to be caused by the business community and passengers who habitually littered the environment. They lacked the sense of responsibility to have common dumping places or garbage collection centers or even collection bins. Oil spills including those from locomotives also covered big parts of the municipality roads and administration offices' compound. Community members would be seen carrying numerous polythene bags with the same contents or related foodstuffs as if carrying many bags would mean carrying more items. Thus, the "I don't care attitude" was the order of the day. Additionally, plastics and other chemical products which could possibly leak into our foods and drinks were routinely used. More so, pollutants such as fossil fuels have a negative impact on the climate, stay in the environment for over 100 years, and kill marine animals. The sense of the effect of these items seems not to have been known or, if known, was ignored. Toxic materials continued to be procured and issued, and fumes from old vehicles and those with dangerous mechanical conditions would be seen in the municipality. Mr. M has been putting emphasis on solving environmental problems facing our country today such as climate change, air pollution, resource depletion, waste disposal, etc. that have characterized the municipality caused by mass production, mass consumption, and mass disposal type of economic activities.

In respect to policy and regulatory aspects, the mayor ensured that most of procurement and other related positions as per the municipality establishment structure were filled to enable him achieve his goal of attaining green procurement awareness. These included accounting officers, procurement officers, and contract committee members, among others. In addition, the council and line ministries such as environment, urbanization, public account committees, etc. were fully operationalized. Planting of trees, grass, and flowers on all the main streets of the municipality was conducted. This was to consume carbon dioxide and produce oxygen for the people. The streets where the trees, grass, and flowers were planted included Republic, Rubabo, Go-down, and Rwamahwa roads. Permanent compost pits/dumping pits for solid waste situated in different areas around the municipality were demolished, and the community encouraged and sensitized to keep garbage in reusable sacks in their homes. On weekdays, the municipality vehicles pass around town to collect the garbage to a common dumping place according to a prearranged timetable. He encouraged the community to separate decomposing and non-decomposing garbage to be used as manure and for recycling or safe disposal, respectively. Garbage produced in shops and markets was put in trash cans that are also picked according to arranged schedule. Sensitization of owners of petrol stations, washing bays, and garages on the dangers of oil leakages and petroleum fumes to the environment was done. They were also advised to collect used oil and or divert it from joining main water bodies; enforce the service period for vehicles; and maintain proper mechanical condition to reduce fumes. The mayor used to move from door to door informing people about the purpose of keeping a clear environment. Some fines and penalties for those people who would not follow his advice and orders were put in place. With the great love he had for greening the municipality, the mayor was sometimes able to use personal resources to achieve this goal. He used to arrange radio talk shows that enabled him reach far and wide; met with different stakeholders such as community leaders, political leaders, opinion leaders, civil society, and municipality employees; and engineered everyone to be aware of the need to preserve the environment. Different people

including members of other municipalities from far and wide have come to benchmark his efforts. Community members have also taken this initiative beyond the municipality. This has resulted into reduced climate change, air pollution, and resource depletion, among others.

With his tireless efforts, Mr. M was able to plant the necessary gardens in the municipality that helped in reducing air pollution and could also act as windbreakers. Most streets looked more beautiful than before because of these gardens. Dust that used to cover all stock in the shop racks and shelves reduced tremendously which was observed by the majority of the business community. Shop owners and or operators were able to buy dust bins. The movement of very old vehicles and those in poor mechanical condition within the municipality was discouraged. Most community members were able to understand the dangers of using hazardous materials and polythene bags. Therefore, the use of the alternative deposable bags such as paper like envelopes, bags that can be reused, and recycling plastics that minimize generating waste or toxics was practiced. Innovations were adopted to convert plastic waste into high-value base materials with sufficient purity to displace virgin materials in high-value uses.

The mayor continued with his efforts to achieve green procurement awareness to the acceptable standards. At his office, he now works like a counselor and specialist for green procurement awareness, and various companies have started taking a fresh look at the environmental impacts of their products. Such examinations often focus on the research, development, and design phases, areas ripe for the growing trend of "design for environment." Simply put, this means corporate buyers are opting for materials that facilitate recycling or disassembly or that are less problematic when disposed of in landfills. They are leaning on their suppliers to help them find solutions – and taking a critical look at potential suppliers' environmental, health, and safety performance along with usual considerations such as price, quality, availability, and performance (Personal interaction with Mr. M on March 12, 2020).

## Theoretical Underpinning

The lessons derived from the action of Mr. M. in the context of **green procurement awareness** call for a theoretical review. According to Whetten (2000), a good theory is one that explains practice or behaviors. There are a number of theories that could explain this action. They include social capital theory, stakeholder theory, and institutional theory. A multi-theoretical approach is adopted due to the inherent limitations in each theory.

**Social capital theory** presumes that patterns of relations and positions in networks influence opportunities, constraints, and behaviors (Bourdieu 1986). Putnam (1993) contends that social capital indicates the features of social structure, such as networks, norms, and social trust which facilitates in coordinating and cooperating for mutual benefits. This theory facilitates networking as demonstrated by Mr. M. who collaborated with the business community, civil leaders, accounting officers, procurement officers, contract committee, and the technical heads at the district, and all worked together in enabling a green environment for the municipality. In this way, societal challenges of questionable conservation of natural resources are resolved, hence protecting the environment. This record notes that creating links does not guarantee that available resources are used in insuring environmental procurement awareness. Drawing from the case of Mr. M., the mayor with support from the government, business community, citizens, regulatory bodies, nongovernmental organizations, and municipality employees availed resources to manage the inappropriate environmental degeneration which had characterized the municipality. Nevertheless, the theory faces insufficient participants that are instrumental in promoting green procurement awareness. This can partly be explained by stakeholder theory.

**Stakeholder theory** asserts that the organization has relationships with several constituent groups that affect or are affected by its decisions (Freeman 1984). It is premised on the notion that "those groups who can affect or are affected by the achievements of an organization's purpose"

should be given the opportunity to comment and input into the development of decisions that affect them. In attempting to promote green procurement awareness, there are a number of stakeholders such as government agencies, private organizations, public accounts committees, local councils, and the line ministry of environment who work together to attain green procurement awareness. These are essentially a partnership between public sector organizations and private sector investors geared towards achieving a predetermined goal of environmental conservation. This is derived from the thinking that private organizations and individuals are generally more interested in making profits which is neutralized by the government's intervention in doing what is best for their citizenry and local communities. The theory pays less attention to well-organized structures that focuses on understanding what drives the institutions to act in attaining green procurement awareness which is partially addressed by institutional theory.

Institutional theorists assert that the organized environment can strongly influence the development of formal structures in an organization, often more profoundly than market pressures. Innovative structures that improve technical efficiency in early-adopting organizations are legitimized in the environment. The theory assumes that most part of the supply chain level actions are the result of an external pressure of a coercive, normative, or mimetic (cognitive) nature. This theory focuses on understanding what drives the firms to act in the way they do. Relatedly, the mayor ensured institutionalization of government structures by filling most of procurement and other related positions such as accounting officers and contract committee members that enabled the attainment of green procurement awareness.

## Conclusion

In this era of globalization, the world is witnessing declining environmental awareness as reflected in the case of Mr. M. which may need to rejuvenate a stronger drive and positive pressure for green practices. From this entry, it emerged that enforcement of stringent laws is needed to promote conservation of the environment. This is attained through incorporating and practicing green procurement management strategies in local communities. The case upon which this research is anchored shows the merits of engaging different stakeholders in promoting green awareness through planting trees, purchasing dust bins, proper waste management, and constant sensitization of the masses in regard to the power of green procurement awareness. However, the study notes the lack of conservation procurement that ought to be strengthened in practice. Based on the merits of green procurement awareness, the entry recommends that more work needs to be done to roll out and mainstream specific green procurement legislation to all the populace in all municipalities.

All in all, if green procurement is to take residence in Uganda, education, training, capacity development, and utmost attention should be focused on awareness and extended to procurement and other decision-making officials from these local and technical leaders in Uganda. Conclusively, laws and regulations of green procurement management should be efficient and effective. Again, senior citizens and opinion leaders should be equipped with knowledge on how to support their citizens in promoting green procurement management.

## Synonyms

Conformity; Social influence

## Definition

Entitativity: The degree to which members of a group are perceived as a coherent unit.
Power: The ability to direct the behaviors and attitudes of others.
Prototypicality: To embody the attributes of the group to which one belongs.
Social identity: People use the social group in which they belong to define their self-concept.

## Introduction

Humans are social creatures with an intrinsic psychological need to belong (Baumeister and Leary 1995). This need to belong is a fundamental motivation for joining a group. However, other factors certainly come into play when deciding what kind of group to join, such as member benefits, status, and self-esteem. As a group member, other factors contribute to the decision to stay in one's group, to be a good member, and even to lead the group. Groups also hold power and can be very influential, in that they can affect the thoughts, feelings, and behaviors of others. Along with a group comes the need for a leader to influence the group and direct it toward its desired goals. It is necessary for leaders to have groups to lead and for groups to have leaders to follow; the two go hand in hand. It is no wonder then why so much research has been conducted to better understand group processes, power, and leadership.

## Group Processes and Social Influence

A group is defined as a collection of three or more individuals who are all dependent upon one another in some way. Groups also have the ability to be socially influential in that a group can affect the actions, attitudes, and emotions of others. Along the same lines, groups can yield power to influence others or control certain events. Groups have the influence and authority that comes from its relative size and structure. Any collection of individuals with the same goals constitutes a group; otherwise, they are merely an assortment of individuals. Four people standing on a street corner would not necessarily constitute a group unless they had the same goals and were aware that the other members also considered themselves a part of the group. Members of a group must share the same destiny and the group must be of some significance to its members; it is not enough to think one is in a group without acknowledgement of and by others. For instance, maybe the people on the street corner were all holding the same signs, picketing the same grocery store, and thinking similarly about what they all stood for. If so, those people would constitute a group in that they were dependent upon one another, identified similarly, and held the same fate (Lickel et al. 2000). People come together all the time to try and influence the attitudes of others, knowing on some level that their message will be better accepted from a group rather than an individual. Having power in numbers is but one advantage of joining a group.

Group membership offers many advantages to the individual. Such advantages include a clear sense of identity, sense of belonging, increased self-esteem, socialization with others, social support, influence, information, and access to resources (Abrams et al. 1990). Such benefits would not otherwise be attainable if alone or in a loosely associated collection of people. One significant benefit is the increase in self-esteem that arises from having a clear role and knowing one belongs in the group (Abrams and Hogg 1988). In the picketing example, the people gain benefits from picketing together because they feel they belong in the group, they have the same beliefs,

and they are far more influential together with their signs than they would be separately. One person alone on a corner with a sign would not elicit the same powerful impact as a group, and having the ability to affect the thoughts, feelings, and behaviors of others is very satisfying and leads one to feel better about themselves and their group.

Groups also provide rules for their members, or norms, so that members know how to behave. Norms help prevent confusion through explicit rules about how to think and act. Military units have norms that are clear so its members know what is expected of them in any given situation – how to behave, how to speak, how to dress, and how to think. Norms ensure that everyone in the group is on the "same page." This is advantageous as uncertainty can arise when expectations are unclear. In fact, the degree to which a group is perceived as more of a coherent unit is referred to as entitativity. Groups higher in entitativity, such as the army or marines, are better at reducing uncertainty for group members compared to groups low in entitativity, such as people waiting at a train station (Hogg 2007). The ability to reduce uncertainty is very important as uncertainty is an aversive feeling individuals are motivated to reduce. Joining a cohesive group with clear norms about what to wear, how to speak, and what to believe with clear roles helps people to assuage the negative feelings of uncertainty and bolster self-esteem. By being part of something bigger than oneself, one can socialize with others who are like-minded and increase their self-esteem by defining themselves in part through their group membership. The interaction between one's psychological self-concept and the social process of belonging to a group is referred to as social identity (Turner and Oakes 1986; Tajfel 1974, 1982; Turner et al. 1979). That is, a person's sense of who they are is heavily influenced by their membership within a group.

While all groups have norms and expectations for their members, not all groups are structured in the same manner. The structure and entitativity of a group depends in part upon the type of group and the particular task at hand. Four varieties of groups have been identified in the literature and vary in their respective levels of entitativity: intimacy groups, task groups, social categories, and transitory groups (Lickel et al. 2000). Entitativity, or group cohesiveness, is highest for intimacy groups such as family members or close friends. In an intimacy group such as a family, all the members of the group are very similar, share the same interrelated outcomes, and will behave similarly. This type of group is the most cohesive. A task group is one that comes together for the specific purpose of achieving a goal. This type of group has high entitativity, but less so than an intimacy group. For instance, a group of marketers within an organization will come together for a new ad campaign, and the members will work closely, think similarly about their goals, but will likely dissipate after the task is completed. The third type of group has even lower entitativity because it is a social category. An example is the category of women. While women constitute a group and are relatively similar, they lack the same degree of cohesiveness that would be present in an intimacy or task group. Women may be similar in that they all fit in the same category, but there is much more variability of identity and behavior within such a group. All women do not necessarily have the same beliefs and goals, and while their outcomes may be related, they are not related to the same extent as other more entitative groups such as intimacy or task groups. Lastly, transitory groups have the lowest levels of entitativity due to their loose associations. Individuals waiting in line at a sandwich shop will all leave with a sandwich, but they will all leave at different times, with different sandwiches, and will eat their sandwiches in different locations rather than eating together. Types of groups, their levels of entitativity, and the extent to which they can provide benefits to their members are all factors considered when joining a group. Another important factor in the decision to join a social group is the presence of leadership.

## Leadership and Influence

Many theories on leadership exist in the literature as this construct has been studied from a variety of

perspectives. However, few leadership theories examine leaders as group members or leadership as an essential group process. One theory that takes a group-based perspective is transformational leadership theory (TLT). Transformational leadership occurs when leaders and followers within a group are interdependent upon one another and motivate each other to work toward common group goals (Kuhnert and Lewis 1987). It is the leader's primary responsibility to have a clear vision, to have an inspirational personality, and to lead by example in order to make change. TLT has since evolved to elaborate further on how leaders impact the group as a whole by gaining trust and respect from other group members (Bass 1990). One of the key components is that leaders must be well liked and have a certain personality style; otherwise, they will not be as effective in generating change or influencing group members. Nonetheless, TLT posits that all group members, including the leader, should look beyond their own self-interests and focus on what is best for the group as a whole. This approach has been studied largely in managerial contexts and boasts of many styles in which leaders can influence in a transformational manner.

Another similar theory is that of shared leadership. Shared leadership takes a group-based approach to leadership; however, rather than one sole leader being responsible for the vision and direction of the group, there are multiple leaders who "share" the role. Leaders are not appointed, rather they emerge from the members ablest and willing to influence the group toward a specific outcome. This allows for a flexible distribution of leadership meant to ensure whomever is most capable and prototypical of the group can readily and efficiently lead. This group-centered approach to leadership has been supported by the literature to be effective and advantageous, especially within team and organizational settings (Fausing et al. 2015; Grille et al. 2015). However, there are also instances when this approach to leadership can be problematic. It is pivotal to note that such a style is more effective when everyone in the group is in agreement about how leadership should be decided and who is most qualified to lead in a given situation.

Along the same lines, social identity theory of leadership (SITL) views leadership as a group process where the leader is a group member who has gained influence and power over the identity, attitudes, and behavior of the group members by embodying what the group stands for (Hogg 2001). Specifically, the main tenet of SITL is that group prototypical leaders are more strongly supported and trusted by other ingroup members compared to less prototypical leaders, especially when the group membership is of great value to group members' identity (Hogg 2001; Hogg et al. 2012; Thomas et al. 2013). Thus, the more strongly one identifies with their group, the more strongly one prefers a leader who exemplifies the core values, attitudes, and beliefs of the group. Power and influence in this theory come from prototypicality. For example, the leader of a political party will emerge when members who highly identify with the group perceive the leader as being the best embodiment of the group's values and ideals. They will trust him or her, be supportive of the leader, and will allow them to exercise their influence with the expectation that the leader will act in the best interest of the group. Members who are not strongly identified with the group may not be as likely to show a preference for a prototypical leader because their group membership may not be a central aspect of their own self-concept. Hence, the key components within this theory are leader prototypicality and group member identification, which are similar to the aforementioned theories. However, the key difference is that SITL is not limited to organizational settings. Rather, this conceptualization of the leadership process can be applied to almost any group.

Social influence and power can take a variety of forms but occurs when one's attitudes and behaviors are affected by others. Within transformational leadership theory, shared leadership theory, and social identity theory of leadership, leadership is best understood as a group process where the members and leaders are all interdependent and have a shared fate. Social identity is integral within the group because it fuels group's power to affect and influence others (Reicher and Levine 1994; Reicher et al. 2005). While the most prototypical group member often

emerges as the leader of the group, the leader has a great responsibility to be mindful of the group's vision and use the group's power and influence to direct the group toward its goals. As the old saying goes, "with great power comes great responsibility." In order for the leader to be effective and to use his or her power constructively, the leader must gain trust and support from other group members to be perceived as effective. There are occasions in which leaders may emerge who are not necessarily the most prototypical member of the group; however, these are typically extreme cases and prototypical leaders are almost always strongly preferred to non-prototypical leaders.

## Group Power and Individual Power

The power literature supports the notion that power can serve as a means for gaining advantage over other people and groups, which, in turn, satisfies the individual' self-concept. It is important, however, to note the distinction between group and individual power. Group power has to do with the degree of control a group has over its own fate and the degree of control and influence it has over other groups, while individual power comes from the way the group is structured and the importance of the role one holds within a group (Rubini et al. 2007). Because leaders are the most influential within a group and have the most important role, they tend to have the most power. This power can be used over other members of the group or it can be used to direct the group to influence other groups, depending on how much power that group holds. The presence or lack of power held by a group affects the extent to which it exercises and asserts its power and influence over others. Power as used by leaders is more harshly used against outgroup members than toward ingroup members, unless ingroup members are not conforming and deviate too far from the norms of the group.

Conformity is an important concept when discussing power and social influence. It is imperative for a group to appear as a cohesive unit, or highly entitative, so that others will perceive the group as significant and unified, thus giving the group more power. Every group has norms which inform members of what behavior is expected of them and conformity is the tendency abide by the norms and be like other members of the group. Group members conform to show they are prototypical. The prototype of the group prescribes the norms of the groups; it represents what the group stands for. Therefore, a group member who is prototypical embodies the values of the group and is, thus, more liked by other members and in no danger of being excluded. Potential exclusion from the group is a real threat to group members who are not prototypical as not conforming to norms makes the group look bad. As well, a member who does not go along with the group norms stands to lose all of the benefits gained from group membership. It is in such cases when a member is not conforming that the leader and other members will use their relative power to derogate the nonconforming members in the hopes that they will stop their nonconforming behavior (Marques et al. 2001; Hewstone et al. 2002).

As mentioned, a group that looks as though they are split or lacking cohesion loses its power and thus becomes less influential over other groups. One way a group gains and signals power to other groups is through its structure. Hierarchy is related to power in that groups with very clear structure are perceived as more organized, resourceful, and thus more powerful. Hierarchy provides group members with an even clearer idea of roles and norms because the hierarchy in itself dictates a power structure; some members will be nearer to the top and others lower toward the bottom. An example of a structured hierarchical group is the US Military. Within this group is a very clear and unambiguous hierarchy where roles and titles are explicit. Everyone knows who sits at the top, who the leader is, and what is expected of them in every situation. Hierarchical power structures are very commonplace within organizations, politics, and military environments. For example, a big box company is perceived as more powerful compared to a small business due to its own hierarchical structure, which conveys high status, prominence, and authority. As such, a big box company has more

power to influence other smaller companies and oftentimes will utilize that power to convince consumers to patronize their company over others, incidentally putting the smaller companies at great risk or altogether out of business.

## Related Concepts

While the leadership theories mentioned herein approach leadership as a group process, there are theories of leadership that are not group related. One example is leader-member exchange theory (LMX), which is organizationally centered and focuses on the dyadic, or two-person, relationship between a manager and his or her employee. This theory focuses on the importance of trust rather than norms and is applied to increase performance and develop a positive relationship between the leader and individual group members (Graen and Uhl-Bien 1995). Some of the terminology within this theory is similar to that of the social identity theory of leadership in that both use the terms "ingroup" and "outgroup," but LMX uses the terms "ingroup" and "outgroup" to describe close versus distant relationships between leaders and followers. For instance, an "ingroup" relationship in LMX means there is a high exchange relationship, while the same term in SITL refers to other people within one's own group. Furthermore, an "outgroup" relationship in LMX means there is a low exchange relationship, while the same term in SITL refers to other people who are not within one's own group, but in another group.

As noted, group power is distinct from individual power. Power as discussed herein has more to do with social influence; however, other forms of power are related and worth noting. Bertram Raven and John French developed the five bases of power, which include referent power, coercive power, legitimate power, reward power, and expert power (Raven and French 1958). These bases of power are largely thought of within organizational contexts involving leaders as managers, CEOs, and the like. Referent power comes from being liked and respected by others, while coercive power comes from intimidating tactics such as threats or punishment. Legitimate power tends to come from an official title or achieving a coveted position within a structured hierarchy. For example, the President of the United States is voted into office and this title affords the President with legitimate power. Reward power comes from offering incentives to group members such as raises or promotions at work, while expert power comes from extensive knowledge in a particular area. For instance, a manager of an engineering team has expert power if he or she knows more about engineering than others. When a leader is perceived as an expert, they are judged more favorably and are more trusted; however, that is tied to their expertise in a particular realm. While these various forms of power can be applied to group leadership and all serve a purpose, it is important to note that Raven and French's approach to individualized power did not necessarily equate power with leadership. That is, group power is distinct from individual power and individual power is distinct from leadership. In the leadership theories mentioned above, group power and social influence come more from the entitativity of the group, conformity of its members, and clear group boundaries than from the leader's personal power and leadership tactics. However, it is clear that these constructs are all related and deserve more empirical attention to better understand how they all interact.

## Conclusion

Groups are a part of our everyday life. As such is it pivotal to understand how they are composed, the way they function, and how they contribute to the psychological well-being of group members. Groups do not exist in a vacuum so one cannot overlook the importance of how leadership works as a group process to ensure the direction and future of the group. In order to understand how groups are influential and utilize their power, we must better understand how the various leadership processes operate. As well, other factors undoubtedly contribute to group power as mentioned

herein such as hierarchy and structure. The power of groups is the collective capacity of a group of like-minded and similar individuals to affect the thoughts, feelings, and behaviors of others. As such, group power is best conceptualized when all contributing factors such as identity, norms, leadership, and hierarchy are taken into account.

# Groupthink Processes and Problems

Gardenia Harris
Illinois State University, Normal, IL, USA

## Synonyms

Thought processes of groups

## Definition

Groupthink, a term created by psychologist Irving Janis, refers to "a mode of thinking that people engage in when they are deeply involved in a cohesive in-group, when members' strivings for unanimity override their motivation to realistically appraise alternative courses of action" (Janis 1972, p. 9). Janis fashioned the word "groupthink" after terminology from George Orwell's novel, *1984*, such as "doublethink" and "crimethink." Janis intended this Orwellian-like expression to convey similar undesirable consequences to those introduced in Orwell's novel (Janis 1972). Janis theorized the phenomenon of groupthink to explain the highly dysfunctional decision process that prompted US government officials to undertake such highly inadvisable military actions as the Bay of Pigs invasion of Cuba and the escalation of the Vietnam War (Sims 1994).

At its essence, groupthink is a process of social influence in which members of very cohesive groups desire and strive for in-group agreement to such a degree they directly or indirectly pressure members to conform to the prevailing group views and norms. To reach this high degree of uniformity, members ignore information that challenges the apparent group consensus, including the dissenting opinions of other group members. In turn, this lack of candid discussion leads to uncritical acceptance of the alternative most popular with the group (Hart 1990).

## Introduction

Following Janis' seminal work on groupthink, analysts attributed a variety of dubious corporate and governmental actions to groupthink among top executives' and presidents' advisors (Sims 1994). For example, President Kennedy's decision to launch the Bay of Pigs invasion of Cuba despite information indicating it would be unsuccessful is commonly cited as an example of groupthink. Similarly, President Johnson's decision to escalate the Vietnam War on the guidance of close advisors despite intelligence indicating the chosen strategy would not win the war has been attributed to groupthink (Janis 1972; Sims 1994). Likewise, the presidential committee that investigated the calamitous space shuttle Challenger launch in which the spacecraft exploded shortly after take-off identified a flawed decision-making process as the primary cause for NASA's failure to halt the launch despite evidence it was risky. In all of these instances, there was strong pressure toward work group agreement, which stopped people from raising controversial issues or correcting the distorted thinking behind risky actions (Sims 1994).

Janis theorized the following conditions are necessary for groupthink to transpire: (1) the belief the group is invincible, (2) disregard of contradictory information or rationalization for its existence, (3) indifference to the unethical and immoral consequences of decisions, (4) stereotypical views of other groups, (5) overt or subtle pressure for dissenters to adopt the majority point of view, (6) a shared belief all group members completely agree on the proposed course of action, (7) self-censorship and failure to disclose privately held views that deviate from the apparent group consensus, and (8) the willingness of "mind guards" to shield the group against the acknowledgment and consideration of information that contradicts the group consensus (Shaw 1981, pp. 443–444).

## Cohesion, Concurrence-Seeking, and Self-Censorship

There is widespread agreement that the foremost cause of groupthink is excessive group

cohesiveness (Hart 1990; Janis 1972; Sims 1994). Cohesiveness is the attractiveness of members to the group, along with the forces acting on members to stay in the group. Members can be attracted to the group for many reasons including the prestige of the group, their liking for other members, the productivity of the group, etc. Because members of highly cohesive groups desire the respect of other members, they are extraordinarily vulnerable to group pressure to conform to group standards and norms (Hart 1990).

Members of extremely cohesive groups worry that appearing confrontational will cause other members to lose respect and regard for them, so they work for in-group agreement at any cost. These group members also pay a lot of attention to what others say and do, to the degree that they may ignore their own beliefs and even say they believe what other people do. Psychologists refer to this behavior as concurrence-seeking. A high level of concurrence among members is often attained through a process called the "cascade effect." Cascading happens when group members base their statements and actions on the people who spoke and acted before them (Sunstein and Hastie 2015). In effect, group members suspend their own critical thinking in favor of their need to conform to the group (Sims 1994). Research demonstrates that proposed solutions that receive strong early support are more likely to be selected as the group's final preference, even if it those alternatives would have failed on their own merits without that initial support. In other words, if initial speakers favor a particular course of action, the group often ends up favoring that position, meaning that the group's conclusion may be an accident of who speaks first (Sunstein and Hastie 2015). Once there is group concurrence, the apparent presence of like-minded people reinforces each member's confidence in the decision and their belief they are right. Furthermore, groups also provide a measure of anonymity, lessening the sense of individual responsibility for an outcome. Thus, the mere presence of other decision makers can prompt increased risk taking, especially if members believe they will not be held individually accountable for the decision (Kowert 2002).

Highly cohesive groups typically devalue dissent (Hart 1990). Group members engage in self-censorship to avoid disagreement that could lead to rejection or separation from the group. When people self-censor, they do not disclose their reservations to others but remain quiet about their concerns or even convince themselves everyone agrees with the decision (Sims 1994). Furthermore, overt or subtle pressure to maintain consensus makes it hard for dissenters to voice criticism (Hart 1990). Obviously, self-censorship contributes to groupthink because when the group members who possess unique and relevant information that is unknown to others fail to divulge it (Sunstein and Hastie 2015), fewer suitable alternatives are considered (Kowert 2002). This increases the chances of making erroneous decisions, undertaking detrimental courses of action, and adopting ill-considered solutions (Kowert 2002; Sunstein and Hastie 2015).

Sims (1994) maintains that stress increases the level of cohesion. Groups operating in high-stakes environments are routinely called on to make decisions in short timeframes. This raises the level of stress the group is under, further enhancing group solidarity. Not surprisingly, Sims found the need to make decisions under time restrictions is associated with a greater likelihood of groupthink due to increased pressure on members to agree rapidly. To achieve speedy agreement, people censor themselves more than they normally would. Groups also find it more expedient to avoid engaging in time-consuming arguments, or taking the time to seek out and consider information or consultation from outside experts. Finally, time pressures reduce mental efficiency and judgment, further increasing the chances of groupthink.

## Groupthink and Ethics

In his book, *Ethics and Organizational Decision Making: A Call for Renewal*, Business Professor Ronald Sims (1994) hypothesizes that some of the unethical business decisions which have recently gained notoriety in the media are the byproducts of groupthink. He maintains that rather than

analyzing ethical decision making solely from an individual perspective, ethical behavior should be viewed from an organizational standpoint and examined as a reflection of organizational culture. Sims' analysis places considerable emphasis on the role groupthink plays in unethical behavior. From his point of view, groupthink helps explain why some organizations sanction groups knowingly committing unethical acts or intentionally ignoring organizational activities individuals actually believe are wrong. Moreover, Sims cites groupthink as the root cause of the perception no ethical alternative exists, as well as the failure to critically reexamine the chosen unethical alternative or other ethical alternatives.

## Combating Groupthink

Given the catastrophic consequences groupthink has for organizations and nations, its prevention is a primary concern. Analyst suggests an array of strategies for averting groupthink. Experts recommend work teams minimize social pressure toward self-censorship by explicitly encouraging members to voice their misgivings instead of suppressing them (Hart 1990; Sunstein and Hastie 2015). Group members can be directed to challenge others' assumptions rather than accepting them at face value. Furthermore, group members should be encouraged to disagree and debate when the answers they receive are not satisfactory (Hart 1990). Honest discussion can occur if groups communicate and demonstrate a genuine openness to differences (Sunstein and Hastie 2015) by actively seeking divergent viewpoints and valuing the resulting conflict. Finally, exploration of all relevant facets of the problem will help avoid the premature adoption of deleterious solutions. Teams can ensure a more thorough consideration of alternatives by the use of idea-generating techniques such as brainstorming (Sims 1994).

Although groups can do a lot of their own accord to deter groupthink, there is widespread agreement that leaders play the most salient role in its prevention since they have the power to institute structures unfavorable to groupthink. Therefore, it is essential that leaders stress that they want to hear the truth, even if it is unpleasant (Sunstein and Hastie 2015). Leaders must establish a norm of open-mindedness and honest discussion. Criticism should be encouraged by reassuring and showing subordinates it will be rewarded and not punished (Kowert 2002) or by creating incentives rewarding disagreement (Sims 1994). Research shows that meetings where superiors speak first tend to produce different outcomes than those when subordinates talk first. To avoid cascade effects, leaders ought to refrain from signaling a preference for a proposed course of action until sufficient information has been gathered and thorough deliberation has taken place (Sims 1994; Sunstein and Hastie 2015).

Experts offer special strategies to elicit members' private misgivings. They suggest simulation of conflict through devil's advocacy. The devil's advocacy technique involves assigning an individual or group the role of critically questioning the underlying assumptions of popular choices (Kowert 2002; Sims 1994). This role can be rotated among individuals. Likewise, groups of people can develop formal presentations that highlight potential concerns.

Furthermore, leaders may elect to designate specific roles to different group members, such as "magistrates" who encourage debate. "Custodians" manage the decision process in a way that ensures varieties of viewpoints are considered, alternative information is sought, and independent evaluation of each option occurs (Hart 1990). The leadership can also appoint ombudspersons to gather members' concerns or anonymous comment forms can be provided (Sims 1994).

Leaders can create conditions that support a multiplicity of opinions by broadening their circle of advisors, ensuring it is diverse (Kowert 2002). Likewise, they can establish an organizational culture that prizes diversity (Sunstein and Hastie 2015). Monitoring the effectiveness of their advisory group is an ongoing process. Its composition needs to be reassessed regularly, and when necessary, changes should be made (Kowert 2002). Exposure to ideas can be heightened by enlisting outside experts to challenge the group (Kowert 2002; Sims 1994). Finally, pressures toward

uniformity can be reduced by assigning advisors to separate work groups. Another advantage of this strategy is its ability to produce a wider range of alternatives (Kowert 2002).

## Conclusion

Although analysts like Hart (1990) greatly value the insight Janis' original conceptualization of groupthink provides, they believe it needs refinement to avoid over-generalization and misapplication of the concept. From their perspective, Janis failed to adequately account for the context in which decisions are made. His critics maintain additional intra- and interorganizational factors effect groupthink. For example, business and governmental organizations often signal that only one point of view is acceptable or right, and people who question or reject it, even for purposes of discussion, do so at their own risk. If persons who espouse a different point of view are disruptive or politically incorrect, they may refrain from speaking out in deference to organizational norms, rather than in response to direct group pressure (Sunstein and Hastie 2015). Therefore, groupthink may occur because group members are operating in an organizational and political hierarchy that inhibits them from expressing doubts or misgivings out of compliance to organizational standards and norms (Hart 1990).

Due to the wide range of problems they confront, all leaders of complex organizations have to rely on the support of advisers to make decisions (Kowert 2002). Furthermore, the emphasis modern organizations place on teamwork and work groups (Sims 1994) necessitates that organizations understand the nature of groupthink. Groupthink occurs in a variety of organizations in the public and private sector (Sims 1994), including religious organizations, corporations, and government agencies (Sunstein and Hastie 2015); future research will focus on ways it manifests in various types of organizations.

## Harmonization

Josette Caruana
University of Malta, Msida, Malta

### Synonyms

Affinity; Comparability; Compatibility; Compliance; Compromise; Convergence

### Definition

Harmonization is a process of achieving compatibility while respecting the particularities of the entities or jurisdictions.

### Introduction

Harmonization implies that a willingness exists to converge toward common solutions in order to promote comparability. It is not the same as all-out standardization, which means that a single rule is applied to all situations (or "one size fits all"). Nobes and Parker (2000: 66) distinguish between harmonization and standardization:

> Harmonization is a process of increasing the comparability of accounting practices by setting bounds to their degree of variation. Standardization appears to imply the imposition of a more rigid and narrow set of rules.

Harmonization and standardization are processes: the former leading to more harmony, while the latter leads to more uniformity. Harmonization and standardization can be regarded as forming a continuum providing various levels of compatibility. The extent of harmonization that is achieved would depend on the existence and applicability of standards. However, the existence of standards does not guarantee harmonization and comparability because this would depend on external and internal factors. The external factors refer to how and to what extent the standards are enforced/enforceable on the entity/jurisdiction. The internal factors refer to the willingness of the entity/jurisdiction itself to adhere to the standards and also to the interpretation of these standards. Some researchers have tried to quantify the level of comparability achieved in business financial reporting due to compliance with international financial reporting standards (e.g., by constructing an "international harmony index" – see Canibano and Mora 2000).

National standards should provide a level of harmonization between entities in a particular jurisdiction, while international standards should provide a degree of harmonization across different countries. The development of the banking industry and sophisticated technology has made the financial world small, by bringing the countries around the world closer together, facilitating trade and the movement of funds and other resources between jurisdictions. This globalization has fuelled the need for harmonized financial

© Springer Nature Switzerland AG 2022
A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

reporting, so that entities can operate with less restrictions across jurisdictions, and the money-lenders and investors have less problems to compare the performance and financial situations of investments around the globe. The demand for harmonized financial reporting has arisen in both the private sector and the public sector.

In the European Union (EU), harmonization exists in the financial reporting of business entities. Harmonization also exists in the macro financial reporting of member states to the EU Commission, but it appears to be rather elusive at micro level in the public sector.

## Different Facets of Harmonization

Harmonization can be observed (or may be pursued) across different planes.

Vertical harmonization refers to the process of reducing differences between entities at different levels in the same sector. In the private sector, vertical harmonization may be observed between entities belonging to the same group. In the public sector, it may be observed between different government levels, for example, between central and regional government.

Horizontal harmonization is the pursuit of converging practices within the same level (e.g., between all local government entities) or across different sectors (e.g., between private and public entities). Horizontal harmonization also includes conceptual harmonization, that is, the convergence of underlying concepts between different methodologies. In accounting systems, for example, financial reporting and budgeting could be based on the same concepts. In public administration, conceptual harmonization may also be considered between financial accounting, budgeting, and national accounting, even though the degree to which these are susceptible to influencing each other is not very well understood.

International harmonization is an ideal that ignores boundaries of jurisdictions. It is the process of getting different countries adhering to similar practices that promote comparability and compatibility. Given that a particular country's legal system and accounting traditions would affect both the development of national standards and their enforcement, international standards are required in order to start thinking along the lines of international harmonization, as has happened in the private sector.

Caperchione (2015) points out that the different kinds of harmonization do not always move in the same direction. For example, the pursuit of converging private and public practices (horizontal harmonization) may result in a divergence from international harmonization. A similar result may arise when focusing on harmonizing needs at a particular level – for example, the focus of reporting needs of regional governments (horizontal harmonization) may clash with other levels (vertical harmonization).

## Convergence Versus Uniformity

Harmonization and standardization are processes that start from the same position, that is, when a difference is observed and is sought to be overcome. The underlying need to reduce differences could be to maximize one's own welfare or to improve accountability in a more pluralistic sense. The two processes differ in the way that they tackle the actual reduction of differences.

Harmonization is the process of convergence toward applying similar practices, rather than a search for uniformity. The objective of harmonization is to move accounting and reporting away from total diversity by making a commitment to find shared solutions, but at the same time recognizing that inherent differences would still exist. Harmonization is a process of change that continuously searches for mutual recognition. It means that different standards may exist in different countries, which standards would not conflict.

On the other hand, standardization attempts to move toward uniformity, where an agreement is reached to apply the same rules. Some argue that standardization is an outcome (a goal to be achieved) rather than a process. The product of complete standardization is uniformity. Uniformity in accounting would mean that the same accounting rules apply, with no leeway for any

options. Mussari (2014: 307) refers to it as accounting unification:

> . . . (U)nification is an extreme form of standardization. It is an attempt to cancel any diversity. . . . In accounting, unification therefore requires a complete standardization of accounting systems and financial statements for all the organizations involved in the process in a given geographical area. Basically, this means not only common budget and financial statements formats as well as identical accounting standards but also a single chart of accounts, as well as identical recording rules, in short, accounting normalization.

Uniform reporting rules worldwide, with all entities treated the same, may seem a very equitable goal. But it may also prove impossible since practices and traditions differ among countries. Ball (2006) warns that uniform reporting rules would stifle international competition among financial reporting systems and the related standard setting processes. It may lead to financial reporting that focuses on the level of adherence to standards, rather than the quality of standard requirements themselves.

## Harmonization of Financial Reporting in the Private Sector

Since the 1970s, the International Accounting Standards Board (IASB) and its predecessors have focused on their main objective to streamline financial reporting of business entities across the globe by promulgating the International Financial Reporting Standards (IFRS). The IASB's work is a continuation of the tradition that had started in the USA in 1959 and adopted in the UK in 1970, to publish codified sets of accrual-based measurement and disclosure policies. The policies are set by nonprofit, nongovernmental, and nonpolitical bodies, which hold no power to enforce these rules. Compliance with these policies is then enforced through the audit requirement of financial statements, entrenched in national legislation.

The IASB's underlying aim is to enhance harmonization of financial reports of entities in the private sector, by developing IFRS that bring transparency, accountability, and efficiency to financial markets around the world. According to the IASB, IFRS strengthen accountability by reducing the information gap between the providers of capital and the people to whom they have entrusted the money. IFRS also contribute toward economic efficiency by helping investors to identify opportunities and risks across the world, resulting in more efficient capital allocation.

Some countries voluntarily accepted these standards as the model to be followed by business organizations and enforced them through their respective company law. Other countries preferred to adapt the IFRS and produce their own national accounting standards. Some countries do not refer to IFRS at all and apply their own national accounting standards.

In 1995, an agreement was reached between the IASC (the predecessor of the IASB) and the International Organization of Securities Commission (IOSCO) whereby IASC agreed to develop a core set of accounting standards, and IOSCO in turn agreed to recommend that these standards be allowed for use in global capital markets. This agreement confirms that one of the primary reasons for international harmonization was to facilitate the operations of worldwide capital markets.

In 2002, the EU was the first major group of nations to consider the adoption of IFRS [1606/2002/EC], with the objective of harmonizing the financial reporting of listed companies. The underlying objective was to ensure a high degree of transparency and comparability of listed companies' financial statements in order to enhance the efficient functioning of EU capital markets and of the internal market. In 2005, the EU endorsed the IASB framework for member states' companies that are listed on a stock exchange. The result is that all EU companies (including companies from the other three European Economic Area countries – Norway, Iceland, and Liechtenstein), which have shares or other financial instruments that are traded on a regulated EU market, should prepare consolidated financial statements that comply with IFRS. The European Commission has stated that IFRS have raised the quality and consistency of financial reporting and brought benefits to companies and investors. This harmonization should result in a high level of

comparability and should also facilitate the work of audit firms in the EU member states.

The endorsement of the IASB framework by IOSCO and the EU made it more legitimate and encouraged the IASB to enhance its convergence program with the Federal Accounting Standards Board (FASB) of the USA in order to reduce differences between financial reporting standards applicable to US companies and the IFRS. It is generally noted that the underlying difference between the IASB and FASB standards is that the former are principles-based standards, making them more flexible and adaptable, while the US standards are more rules based and strict. As of 2015, it appears that the convergence process between the IASB and the FASB has slowed down. This may indicate a limitation on the standardization process strongly sponsored by the current globalization, due to increased national interests to protect the peculiarities of national economies and the competitiveness of private sector entities that drive these economies. Another limitation on the level of comparability achieved through this harmonization process is caused by the principles-based nature of IFRS themselves: the various options that are available in their application render the measurement provisions of assets and profits too inherently flexible to ensure an appropriate level of harmonization. Evidence from the private sector shows that despite the wide adoption of IFRS, divergences still arise due to policy options, enforcement practices, and language issues (Nobes 2013).

The EU has not endorsed the IFRS for small- and medium-sized entities and decided to establish its own common rules with the objective to simplify and harmonize the financial reports of medium, small, and micro businesses in EU member states. The "Single Accounting Directive" [2013/34/EU] replaces the Fourth [78/660/EEC] and Seventh [83/349/EEC] Accounting Directives on individual and consolidated accounts. Harmonization of financial reports at this level may be at a rather low degree because of the various options (90 options, according to the Federation of European Accountants) available to member states in the directive.

## Harmonization of Governmental Reporting at Macro Level

Harmonization of government finance statistics (GFS) in EU member states became necessary with the introduction of the single euro currency in 1992. Reference is being made here to reporting about the economy of a country as a whole, which requires a totally different type of accounting and reporting than for an entity. Economics is the basis for country reporting of the size and performance of the economy at macro level. This type of statistical reporting is quite misleadingly referred to as "national accounting," but is in fact not accounting at all, with one fundamental difference being the lack of auditability of the data used in the statistical reports.

The statistical measures report on the debts, deficits, and gross domestic product (GDP) and are harmonized at an international level by the conceptual framework laid down in the System of National Accounts (SNA) 2008, adopted by the United Nations Statistical Commission. More comprehensive compilation guidance on how to make statistics is provided by the International Monetary Fund's GFS Manual, and, in particular for EU member states, by the European System of National and Regional Accounts (ESA) 2010.

The ESA 2010 is derived from, and is broadly consistent with, the worldwide manual for national accounts (2008 SNA), thus maintaining international comparability. The distinctive characteristic of the ESA 2010 is that it is a legal act (enforceable by Regulation 549/2013/EU), with precise definitions, intended as a reference guide for EU member states.

The Maastricht Treaty of 1992 organized the way that multilateral fiscal surveillance would be conducted within the EU. The provisions regarding the excessive deficit procedure (EDP) are currently defined in the 2012 consolidated version of the Treaty on the Functioning of the EU (TFEU). The TFEU obliges all 28 EU member states to comply with budgetary discipline by respecting two criteria: a deficit to GDP ratio and a debt to GDP ratio not exceeding 3% and 60%, respectively, for the general government sector, as

defined in the Protocol on the EDP annexed to the TFEU.

Council Regulation 479/2009/EC (as amended by Regulations 679/2010/EU and 220/2014/EU) requires that EU member states report EDP-related data to Eurostat (a Directorate of the European Commission) twice per year. The data are reported in harmonized tables, designed specifically to provide a consistent framework, with a link to national budgetary aggregates and between the government net lending/borrowing and changes in government debt. Since 1994, Eurostat has been in charge of the mission to ensure a proper application of the ESA in order to obtain reliable and comparable statistics across the EU.

Despite this policy thrust toward harmonization and comparability, EU member states do have recourse to arbitrage, and such practices may have been brought in the limelight during the 2008 EU crisis. However, the framework that facilitates harmonization of macro reporting does exist.

## Harmonization of Governmental Reporting at Micro Level

> While it is necessary to be clear about the nature and amount of diversity across Europe, the governmental accounting systems in every country face essentially the same problems but sometimes solve these problems by quite different means, though very often with similar results. (Jones 2007: 109)

Harmonization in the public sector at micro level is complicated. The first problem is that it is difficult to define the public sector as it contains a variety of entities and organizations that have different legal structures and objectives. Whatever the type of entity, its ultimate goal should be the interest of the public (rather than private interests, as in the case of entities operating in the private sector). The provision of public goods and services could be done through a variety of organizational structures, and some may even be profit-oriented companies, partly or wholly owned by the government.

The second issue is that binding all these entities together, there would be the overall governmental administrative structure with government departments and ministries. This administration could be at various levels: central or federal, state or regional, and municipal or local government. The accounting and accountability requirements at these levels need to be considered as well.

For such a complex scenario that makes up the public sector, jurisdictions have traditionally developed their own individual accounting practices and formulated national accounting standards that would suit the political, social, and economic characteristics of the country. The budget has always been at the center of most public sector accounting systems, and traditional cash-based budget-oriented systems developed. As the structure of the public sector grew and became more complicated, certain public entities felt the need to adopt more private sector-like reporting and started referring to the business accounting framework, that is, accrual accounting. This happened especially for profit-oriented public entities, while non profit-oriented public entities found it more difficult to do this.

Having said this, studies show that accrual accounting and reporting practices are widespread throughout the EU at local government level; however, the central governmental administration of certain countries are reluctant to move from the traditional budget-oriented reporting to accrual accounting. The central governments that have made this move prefer to maintain their budgetary accounting and add on accrual financial reporting. The result is that, while basically having the same aims, financial reporting in the public sector is a mosaic of accounting systems that follow various financial reporting standards: some comply with IFRS or national accounting standards that are similar to them, while others apply national accounting standards that have nothing to do with IFRS. Researchers have tried to attribute the propensity of governments to adopt IFRS or similar frameworks for their reporting by classifying systems into Continental European and Anglo-American models, but such categories do not appear to apply at government level.

A recent study (Brusca et al. 2015) on governmental accounting systems in 14 European countries revealed substantial differences, but also

some similarities, across countries and within government levels. Vertical homogeneity is observed in budgeting systems since, in the majority of the countries included in the study, the same budgeting system is followed within the different levels of government in a given country. On the other hand, in the case of accounting systems, there is significant heterogeneity among different government levels, and vertical harmonization exists in only four of the countries covered in the study. The study highlights that the strong role of the rules set out by the EU emphasize the need for accounting harmonization. However, it recognizes the challenge presented in harmonizing budgeting, accounting, and auditing in Europe, especially in those countries where budgeting and reporting follow different accounting bases (i.e., there is lack of conceptual harmonization).

In the USA, state and local governments and government entities use accounting standards set by the Governmental Accounting Standards Board (GASB) for their financial reporting, which are different from the FASB standards applicable to business entities. The GASB was founded in 1984, with the objective of harmonizing governmental accounting practices and, in the process, improving the quality, transparency, and comparability of government financial information.

## The International Public Sector Accounting Standards (IPSAS)

The IPSAS project, launched in 1996, is aimed at developing a single accounting language for the public sector, as a means of harmonizing and aligning public sector accounting. The IPSAS are the public sector equivalent of the IFRS. In fact, the objective of the IPSAS Board (IPSASB) is to converge public sector accounting and private sector accounting. The IPSASB seeks to retain the accounting treatment and even the original text of the IFRS, when these take into account public sector requirements. Except for different terminology and examples given in the implementation guidelines, some IPSAS are a replica of the corresponding IFRS. There are of course IPSAS that concern only public sector issues, just as there are IFRS that concern only the private sector and are not necessary to be considered for the public sector.

The IPSASB recognizes the sovereign right of governments and national standard setters to establish financial reporting standards within their jurisdiction. Neither the IPSASB nor the accounting and audit profession can enforce compliance on their own. But the IPSAS are gaining international acceptance due to the support being given to them by international and supranational organizations. The fact that international and supranational bodies adopt IPSAS directly for their own financial reporting and relate financial aid given to developing countries with the implementation of procedures and structures based on IPSAS is another plus for the IPSASB in establishing its international recognition. But, unlike sovereign governments, these international bodies do not have the financial and legislative power to set their own standards. Having said this, however, it cannot be denied that the adoption of international accounting standards would ensure comparative and standardized information on finances and economic situations of public sector entities across jurisdictions. And since the IPSAS have been derived from IFRS, they are built on an accounting basis that has been well established in the private sector.

The operations of the EU, with its various processes of collection and reallocation of resources employed by different countries, have created the need for more transparency by the EU itself and for convergence between the different accounting systems used by member states. The IPSAS were recommended as a reference model for government accounting reform in the EU member states, especially following the EU crisis of 2008.

## The European Public Sector Accounting Standards (EPSAS)

The Budgetary Framework Directive [2011/85/EU] addresses two requirements from member

states: to implement public sector accounting systems covering all sectors of general government as defined in the ESA, which generate the accrual data needed for ESA purposes, and to subject national public sector accounting systems to internal control and external audit. This regulation does not clarify whether the public sector accounting systems themselves need to be accrual based or whether the accounting systems are only required to be able to generate the accrual data needed for ESA purposes.

The same Budgetary Framework Directive required Eurostat to assess the suitability of IPSAS for EU member states, in order to see whether it could be possible for all member states to apply a single set of public sector accounting standards. It is claimed that the objective of such harmonization is to improve accountability, efficiency, and effectiveness of public sector management; it should indirectly also improve the efficiency and effectiveness of public sector audit; and better fiscal transparency is expected to affect the information available to financial markets. Eurostat examined the situation in 2012 and the Commission issued its report in 2013 (EC Eurostat 2013).

Given that the main sources of national accounting statistics are the accounting records and reports of the various government entities, reliable government financial accounts are deemed essential for the preparation of national accounts. According to the Commission's report (EC Eurostat 2013), the system for fiscal statistics has not sufficiently reduced the risk of low-quality data being notified to Eurostat. The Commission believes that the current system of reconciling the data from the various public sector accounting systems at micro level with the data submitted according to ESA at macro level may no longer be sustainable.

According to the Commission (EC Eurostat 2013), harmonized accrual accounting at micro level is essential because the data at macro level that is used for fiscal monitoring is already accrual based. The Commission, therefore, is promoting the adoption of accrual accounting systems for the public sector to complement the cash accounting systems. Cash accounting systems are still considered important, particularly for the purposes of budgeting and budgetary control.

The Commission's report (EC Eurostat 2013) also states that, similar to private listed companies, government entities have an obligation to provide quality financial reporting to market participants, that is, owners of government debt securities and potential investors. Therefore, since private sector accounting standards are harmonized within the EU, the same thing should apply for the public sector.

Eurostat is thus promoting a system of harmonized accrual-based accounting standards, consistent with ESA, for all entities of the general government sector. IPSAS are the only internationally recognized set of public sector accounting standards and, hence, their consideration.

Based on Eurostat's study, the Commission concluded that IPSAS are not suitable for direct implementation by the member states (EC Eurostat 2013). The reasons given include the alternative accounting treatments that IPSAS offer, the fact that IPSAS are still being developed, the question surrounding their governance, and IPSAS do not take sufficient account of specific needs, characteristics, and interests of public sector reporting. For example, the IPSAS do not deal with budgeting and budgetary control, and the reporting entity definition in IPSAS is not in line with the core concept of general government as defined in ESA. In spite of all this, the Commission's report (EC Eurostat 2013) expresses the understanding that IPSAS provide a good basis for the development of public sector accounting standards that would cater for the specific needs of EU member states.

Since most member states are not comfortable with IPSASB's governance and due process, the EU Commission is setting up its own governance structure with the necessary powers to legislate its own accounting standards, namely, the European Public Sector Accounting Standards (EPSAS). However, the Commission (EC Eurostat 2013) emphasizes the need to keep close links with the IPSASB and the importance of maintaining a minimum level of global comparability by not creating unnecessary

differences between EPSAS, IPSAS, IFRS, and ESA. The resulting EPSAS would therefore provide a very interesting combination of accounting, economics, and statistical principles: a harmonization of multidisciplines? The idea is not original because, since 2005, the IPSASB has had an ongoing project examining the possible convergence of ESA and IPSAS. The EPSAS project appears to be an attempt to formalize this convergence, but the outcome still needs to be assessed. Eurostat harbors reservations about the extent of IPSAS and ESA convergence, especially when it comes to the consolidation rules. Such rules would identify which entities are to be included in the ensuing consolidated financial reports.

The Commission (EC Eurostat 2013) draws attention to the fact that a set of harmonized EPSAS on their own are not the solution to guarantee the quality of accounting data. The underlying governance structure needs to be strengthened and this needs strong political support, effective internal control, and external financial audit.

## Conclusion

Attempts are made to promote harmonization of financial reporting for entities in the private sector, entities in the public sector at micro level, and between private and public entities. Harmonization is also deemed useful for macro statistical reporting produced by jurisdictions for their economies.

Some regard harmonization as an unavoidable challenge for accountability. In the EU, the framework that supports harmonization of governmental reporting at macro level already exists. However, harmonization of government financial reporting at micro level is difficult to envisage, especially since a jurisdiction would probably wish to maintain a certain level of autonomy in order to produce financial reports that suit its particular national requirements.

> Every society keeps the records most relevant for its major values. (Lazarsfeld 1959: 108, cited in Hopwood 1984: 167)

The limitation of the standardization process noted in the private sector may be stronger in the public sector. In the public sector, the constitutional and socioeconomic implications of governmental financial reporting cannot be ignored. Attempts to harmonize private and public sector accounting may be criticized because the obligations of accountability of a private entity are very different from the obligations of accountability of a government. It would therefore be quite difficult to expect acceptance of accounting practices developed for businesses and the attendant reporting standards, because they may not fulfill the accountability obligations for public sector entities.

Ellwood and Newbury (2006: 31) argue that an attempt to converge private and public sector concepts "would not do justice to the inherent differences between the sectors." The result may be just an "illusion of convergence" because the mere adoption or interpretation of private sector (business) accounting standards would not focus on the uniqueness of government accounting. Particular features relating to government accounting (e.g., tax revenue and debt capacity) cannot be dealt with properly as mere afterthoughts. It is also counterproductive to apply terms that have been developed for business entities and give them a different interpretation so as to apply for public sector entities.

The demand for harmonization between countries (international harmonization) mainly emerged as a result of globalization. Thus the usefulness of international harmonization for the private sector can be appreciated, especially by the participants in capital markets. In an increasingly globalized world, some degree of convergence seems desirable, if not inevitable. The differences between the accounting rules among nations need to be narrowed, but the optimal degree of uniformity is not clear and "is a long-unresolved issue" (Ball 2006: 25).

In the case of the public sector, particularly for governmental accounting, the desirability of international harmonization is debatable. In spite of the support for international harmonization, European governments appear reluctant to strive

toward Europe-wide harmonization and prefer to work within their country to achieve internal vertical or horizontal harmonization. According to Caperchione (2015: 4),

> This is no surprise. Public sector accounting is one aspect of a country's sovereignty, which cannot be disposed of without very compelling reasons.

## Synonyms

Chief official of the Russian Federation; Federal president; President of the Russian Federation

H

## Definition

Currently the head of the Russian state is officially titled the President of the Russian Federation. Under the Constitution of the Russian Federation, this official is vested with numerous powers in various spheres including international policy, national security, legislation, and public administration. As a head of the state, the President of the Russian Federation:

- Represents the latter in international relations and within the country
- Is responsible for coordinated functioning and interaction of governmental institutions and personally controls a number of them
- Makes certain decisions on behalf of the Russian Federation

Immense concentration of authority in the federal President's hands makes him one of the most powerful officials in the modern world. This fact also presumes enormous scope of responsibility of the President of the Russian Federation and predetermines high dependence of the Russian politics on the personality of the head of the state, importance of the system of informal checks and balances, and political significance of advisory bodies (Avtonomov 1999) and of the presidential Administration.

## Introduction: Historical Background

For the most part of statehood history, Russia had a monarchical system of government. Following the February Revolution of 1917, the last Emperor abdicated from the throne. In September 1917 the Provisional government declared Russia a republic. Soon afterwards the Great October Socialist Revolution originated the Soviet period of the Russian history. Collective character of the Soviet political system applied to both representative and higher administrative bodies. The functions of the head of the Soviet state had been long performed by collective institutions as well until 1937 that was the All-Russian General Executive Committee (a legislative body, despite its name). Subsequently the Presidium of the Supreme Council (the newly established legislative body) played this role. The individual head of the Soviet Russian state had not existed until 1990 when the office of the President of the Supreme Council was established.

Shortly thereafter, the functions of the head of the state passed from the legislative branch to the chief executive, the President of the Russian Soviet Federative Socialist Republic (RSFSR) that was popularly elected in 1991. The current federal Constitution enacted in 1993 still names the President of Russia the head of the State, although he is no longer designated as the chief executive (see ▶ Federal Government, Russia).

## Elections and Impeachment of the President of the Russian Federation

Originally the President of RSFSR had been being elected for the term of 5 years and could not stay in office for more than two consecutive terms. The Constitution of 1993 reduced this term to 4 years, and the constitutional amendment of 2008 changed it to 6 years. The rule regarding the number of terms in office remains in force.

Basic requirements for the nominees for the office of the President of the Russian Federation are listed in the Constitution of the Russian Federation. These are the following: Russian citizenship (either by birth or by naturalization), minimum age of 35, and a permanent residence record in the Russian Federation of not less than 10 years.

The Federal Law No. 19-FZ dd. 10 January 2003, "On Elections of the President of the Russian Federation," sets a number of additional requirements to the nominees regarding criminal and police records and to their public support. According to the said Law, a citizen can be either nominated for election by a political party or at the conference of not less than 500 voters. Besides, not less than 100,000 voters' signatures should be collected in order for the partisan nominee to be registered (this requirement does not apply to the parties that received at least 5% votes at the last federal parliamentary election) or 300,000 voters' signatures in case of self-nomination.

The impeachment procedure is outlined in Art. 93 of the Constitution of the Russian Federation. According to it this procedure shall be initiated by the State Duma (the lower chamber of the federal parliament), by two thirds of the deputies, on charges of high treason or another grave crime. These should be confirmed by the Supreme Court of the Russian Federation, while the Constitutional Court of the Russian Federation should confirm that the rules for advancing the charges were observed. Given these steps passed, the President may be impeached by the Council of the Federation (the upper chamber of the federal parliament), by two thirds of its members. This procedure had been initiated only once, in 1998, with no success.

## Functions of the President of the Russian Federation

Under provisions of Chapter 4 of the Constitution of the Russian Federation, its President is the head of the State, the "guarantor" of the Constitution of the Russian Federation and of the rights and freedoms of man and citizen, and the Supreme Commander-in-Chief of the Armed Forces of the Russian Federation. Noteworthy, no explicit affiliation of the President of the Russian Federation to any of the branches of government can be found in the text of the federal Constitution. Consequently,

a number of theories describing his political role exist (Chirkin 2014; Kutafin 2013).

According to the first, a popular, but not the most sophisticated one, the President does not belong to any branch of government but towers over them. In support of this vision, the guarantor's identification of the President is commonly mentioned. Besides, the Constitution of the Russian Federation declares that the President shall fulfill numerous functions. He shall adopt measures to protect the sovereignty of the Russian Federation, its independence, and state integrity, determine the guidelines of the internal and foreign policies, and represent the Russian Federation within the country and in international relations. Besides, he has a certain role in electoral process, as according to the Federal Law "On the Basic Guarantees of the Russian Citizens' Electoral Rights and the Right to Participate in Referenda," and he appoints one third of the voting members of the Central Election Commission of the Russian Federation.

The second theory concentrates on the arbitrary function of the President (that allows to place him either above or between the branches of government). The constitutional provisions grounding this point of view are the ones vesting the President with the powers to ensure coordinated functioning and interaction of all the governmental bodies (Art. 80, Para. 2) and to use conciliatory procedures to solve disputes between the governmental bodies of the Russian Federation and of the constituent units of the Russian Federation, as well as between regional governments (Art. 85, Para. 1).

Thus, the President appears to act as an arbiter between the federal governmental bodies, between the orders of government, and between regions. Since 2000 an advisory, nonconstitutional (established by the presidential Decree No. 1602 dd. 1 September 2000) body, the State Council of the Russian Federation, exists under the President of the Russian Federation that is destined to assist him in fulfilling coordinative and arbitrary functions. Currently the State Council comprises the leaders of all constituent units of the Russian Federation, as well as a number of representatives of the Federation.

Under the third approach, the President of the Russian Federation is the head of the federal executive. This vision seems to be reasonable, as most of the presidential powers are of administrative nature. He plays the pivotal role in formation of the executive, as well as in performance of the executive functions. The President of the Russian Federation appoints and dismisses all members of the collegial executive body constitutionally titled the Government of the Russian Federation (see ▶ Federal Government, Russia). Under Constitution the head of the State has the right to chair the sittings of the Government of the Russian Federation and can cancel its decisions. Virtually, the President acts as a chief executive of the Russian Federation by issuing bylaws.

Besides, he forms and heads the Security Council of the Russian Federation, approves the military doctrine of the Russian Federation, appoints and dismisses the supreme command of the Armed Forces of the Russian Federation, and has the power to introduce martial law or a state of emergency in the Russian Federation or in certain parts thereof.

The President of the Russian Federation also governs the foreign policy of the Russian Federation; appoints and recalls diplomatic representatives of the Russian Federation in foreign states and international organizations upon consultations with corresponding committees and commissions of the chambers of the Federal Assembly; holds international negotiations; signs international treaties and agreements of the Russian Federation, as well as ratification instruments; and receives credentials and letters of recall of diplomatic representatives accredited to him.

The President of the Russian Federation helms the system of law enforcement. Apart from appointment of the federal Minister of Internal Affairs, he proposes nominees for the positions of the Procurator-General of the Russian Federation and his deputies and appoints and dismisses public prosecutors of constituent units of the Russian Federation (Art. 129 of the Constitution of the Russian Federation), as well as the Chairman of the Investigation Committee of the Russian Federation (Art. 13 of the Federal Law

No. 403-FZ dd. 28 December 2010, "On the Investigation Committee of the Russian Federation").

Furthermore, he has considerable financial powers. Apart from the mentioned power to appoint all members of the Government of the Russian Federation (including the federal Minister of Finance) that is responsible for drafting of the federal budget and its execution, according to the Constitution of the Russian Federation, he proposes the nominee for the office of Chairman of the Central Bank of the Russian Federation to the State Duma. Besides, under the Federal Law "On the Accounts Chamber of the Russian Federation," all the members (the chairman, its deputy, and auditors) of this parliamentary body of financial control are appointed upon nomination by the President of the Russian Federation.

The President of the Russian Federation is not only an actual leader of the federal executive. Owing to the federal legislator, he exerts influence upon regional executives. Under Constitution of the Russian Federation, this influence is limited to the power to suspend decisions of the executive bodies of the constituent units of the Russian Federation that he considered to be unconstitutional, unlawful, etc., until the issue is solved by an appropriate court.

In addition to that, according to the amendments of 11 December 2004 to the Federal Law "On the General Principles of Organization of the Legislative (Representative) and Executive Bodies of Constituent Entities of the Russian Federation" and until 2012, all the heads of all regional governments had been being vested with authority by the legislatures of the respective constituent units upon nomination by the President of the Russian Federation. This procedure had been popularly interpreted as quasi-appointment by the President. This practice ceased to exist, yet there is still a strong inertia in relations between the President of the Russian Federation and regional leaders, as most of the governors elected in recent years had used to hold the same office as presidential nominees.

Currently chief executives are popularly elected officials in most constituent entities of the Russian Federation. However, the President retained the power to remove a chief executive of a constituent entity of the Russian Federation from his office in certain cases and to appoint an acting chief executive (see ▶ Regional Executives, Russia). Besides, shortly after popular elections of these officials had been provided for anew, an alternative procedure for vesting a citizen of the Russian Federation with the authority of a chief executive of a constituent entity of the Russian Federation was established. At present, in ten constituent entities of the Russian Federation chief executives are elected by the legislatures, while the President of the Russian Federation acts as an intermediate elector of the nominees (see ▶ Regional Executives, Russia).

According to the fourth theory, the President of the Russian Federation is a single-member body that simultaneously belongs to all the three branches of government, as the constitutional list of his powers refers to every of these branches. He takes part in formation (as well as dismissal or dissolution) of almost every federal body. The President announces elections to the State Duma and has the right to dissolve it in cases specified by the Constitution of the Russian Federation:

- Once the State Duma rejects the presidential nominees for the office of the Chairman of the Government of the Russian Federation thrice consecutively
- Once the State Duma votes an unsolicited no-confidence vote in the Government of the Russian Federation
- Once the State Duma refuses confidence in the Government in response to its Chairman's request

According to the constitutional amendment of 21 July 2014, he got a right to participate in formation of the upper chamber of the Federal Assembly, the Council of the Federation, which used to serve for regional representation since its establishment in 1993 (see ▶ Federal Government, Russia). The President of the Russian Federation appoints and dismisses all members of the Government of the Russian Federation. Besides, he personally appoints and dismisses some deputy

ministers, as well as directors and deputy directors of 15 federal executive bodies (titled "federal services" and "federal agencies").

The President actually forms the whole federal judiciary. He personally appoints the judges of all federal courts except two of the latter, the Constitutional Court of the Russian Federation and the Supreme Court of the Russian Federation (see ▶ Federal Government, Russia). These are comprised of judges appointed upon suggestions of the President. Besides, the President proposes the candidates for the positions of the chairmen and deputy chairmen of the Constitutional Court (since 2009) of the Russian Federation and the Supreme Court of the Russian Federation (since 2011).

Furthermore, the President of the Russian Federation exercises powers referring to all branches of government. According to the Constitution of the Russian Federation, he has the powers to announce referendums, to initiate bills, to veto the federal laws passed by the Federal Assembly, to sign, and to promulgate federal laws. Noteworthy, in the 1990s, the President used to legislate on some issues himself, and this practice received the sanction of the Constitutional Court of the Russian Federation. In section 4 of the reasoning part of its resolution No. 11-P dd. 30 April 1996, on verification of constitutionality of Para. 2 of the Decree of the President of the Russian Federation No. 1969 dd. 3 October 1994, "On the Measures on Consolidation of the Executive in the Russian Federation" and Para. 2.3 of the Regulations on the Head of Administration of a territory, province, city of federal significance, autonomous province, and autonomous area, approved by the mentioned decree, the Court validated the presidential decrees that fill gaps in legislative regulation, provided that such decrees do not contradict the Constitution of the Russian Federation and federal laws and that their duration is limited to the period prior to adoption of the federal law. For instance, up to the present, no federal legislation on the federal ministries and similar bodies subordinate to the President of the Russian Federation and to the Government of the Russian Federation exist. In the wake of this gap, the whole construction of the federal executive is decided upon unilaterally by the head of the State, with no consent of the parliament. Currently this construction is fixed in two presidential decrees, No. 314 dd. 9 March 2004, "On the System and Structure of the Federal Executive Bodies", and No. 636 dd. 21 May 2012, "On the Structure of the Federal Executive Bodies" (as amended).

Moreover, actually, the President of the Russian Federation can provide legal regulation on the matters of constitutional significance. For example, he determines the composition of the Government of the Russian Federation (i.e., the number of deputy Chairmen of the Government, and the list of federal ministers, as he is responsible for establishment of the ministries themselves). It is the head of the State who defined the status of its Administration that had gradually become the center of policy-making and is regarded as a parallel federal government. The President of the Russian Federation had also divided the territory of the country into supra-regional formations, the federal districts, and established the State Council of the Russian Federation (see ▶ Multilevel Governance and Public Administration, Russia).

On certain occasions the President of the Russian Federation acts as a judicial body. Under Art. 86 of the Constitution of the Russian Federation, he decides on pardoning. Besides, as mentioned above, one of his functions is to solve disputes between the governmental bodies of the Russian Federation and of the constituent units of the Russian Federation, as well as between regional governments. The head of the State can also cancel decisions of the Government of the Russian Federation on the ground of their inconsistency with the Constitution of the Russian Federation, federal laws, and decrees of the President of the Russian Federation and suspend decisions of the executive bodies of the constituent units of the Russian Federation in case they contradict the Constitution of the Russian Federation, federal laws, or international obligations of the Russian Federation or violate the personal rights and freedoms until the issue is solved by appropriate court. Thus, the President of the Russian

Federation and the Constitutional Court of the Russian Federation and regular courts possess concurrent jurisdiction.

Nonetheless, on the whole, the worded qualification of the President as a "multibranch" body is doubtful, as actually no governmental bodies exist whose functions would be confined to a single branch of government. Following this approach, one should assume that, along with the head of the State, the Council of the Federation and the State Duma of the Federal Assembly, the Government of the Russian Federation, and even the Constitutional Court and the Supreme Court of the Russian Federation each belong to several branches of government at a time.

The fifth concept places the head of the State at the helm of a separate, "presidential" branch of government. Formation of this branch traces back to the presidential decree No. 13 dd. 19 July 1991, "On the Administration of the President of the RSFSR," considered to remain in force nowadays.

## Administration of the President of the Russian Federation

In 1993 the Administration of the President obtained constitutional status. However, the Constitution of the Russian Federation stipulated in Art. 83 just that the President of the Russian Federation forms his Administration, leaving all the matters regarding its legal and political status at the President's discretion. Consequently, having started from a secretariat-type body, the presidential Administration evolved into a branched system of offices throughout the country.

Currently the Administration of the President functions under provisions of the decrees of the President of the Russian Federation No. 400 dd. 25 March 2004 and No. 490 dd. 6 April 2004, amended lately. It monitors the whole public administration including the regional and local levels and informally acts as a decision-making or an approval-granting center. On the level of federal districts, Administration's offices are the apparatuses of plenipotentiary representatives of the President of the Russian Federation. In constituent units of the Russian Federation and on the lower levels the federal inspectors, chief federal inspectors, and other officials of the Administration operate.

As of today, the Administration of the President of the Russian Federation is actually the main center of political and administrative decision-making in the country, as all the documents requiring presidential signature (either his own decrees, orders, instructions, etc., or federal laws, international treaties, etc.) pass through this body. This mere fact could be responsible for assuming by the Administration enough power for ruling the country informally. For instance, as far as dozens of thousands of key offices in the federal government are filled by the President of the Russian Federation, all the nominees for these offices can apprehend some dependence on the Administration, at least in a bureaucratic sense.

Moreover, the functions of the Administration of the President of the Russian Federation are not restricted to preliminary consideration of the President's decisions. The Administration has further levers of influence upon various bodies and officials referring both to the federal and to the regional levels of government, as it is entitled to monitor implementation of either decision taken by of the President of the Russian Federation. Moreover, since 2013, the Administration of the President can conduct inspections considering public officials' receipts and expenditures, foreign bank deposits, and other issues subject to restrictions according to federal legislation. These inspections may refer to the members of the federal parliament and of the Government of the Russian Federation, to other key politicians of the federal level, to key federal civil service offices, to the leadership of the national corporations, to the political offices of every constituent unit of the Russian Federation, and even to key offices in municipal areas and city districts (see ▶ Institutional Foundations of Local Self-Government, Russia).

## Conclusions

Regardless of the approach taken to describe the position of the President of the Russian

Federation within the Russian government, he undoubtedly helms the institutional system of public administration. Under the federal Constitution, he concentrates vast administrative powers that he executes either personally, by issuing decrees and other decisions of administrative nature, or via 20 federal executive bodies (ministries, services, agencies) that are directly subordinate to him. He actually rules the system of federal public service, as he personally appoints thousands of key officials, and is indirectly in charge of recruitment of millions of civil, military, and law enforcement servants.

Besides, indirectly, he guides the policy of the federal council of ministers (the Government of the Russian Federation) and of the leaders of the higher regional officials (chief executives) that are politically responsible and legally answerable to him (see ▶ Federal Government, Russia; ▶ Multilevel Governance and Public Administration, Russia; ▶ Regional Executives, Russia).

## Definition

Health insurance refers to a policy vehicle incepted to extend healthcare and unforeseen financial expenditure protection to vulnerable populations.

## Introduction

At the turn twentieth century, the prominence assigned to healthcare access by populations around the globe engendered a much-invigorated interest in healthcare policy and research. Healthcare as a social commodity is touted as an indispensable conduit for advancing human development in its multifaceted dimensions (Arkorful et al. 2018, 2020; Arkorful 2020). Essentially, the capability and capacity to pursue life devoid of premature deaths and illness, while

reducing deprivations and facilitating freedom, are all predicated on healthcare (Sen 1999). Equitable access to health service is the prime focus and pathway for reducing inequities that characterize social systems (Kizito et al. 2012). To a larger extent, the realization of these set of priorities, to a larger extent, is contingent on an effective and efficient distribution of healthcare benefits across a broader spectrum of populations and subpopulations.

Within the context of healthcare access and inequity reduction, health insurance is touted as an efficacious policy, especially in low and middle-income polities where it has enhanced improved access and extended protection from risk and other uncertainties regarding healthcare expenditure (Carrin et al. 2005). For instance, through the Universal Health Insurance Scheme implemented in 1993, Columbia has been able to extend financial protection to approximately 95% of its population (Escobar et al. 2010). The implementation of the Universal Coverage Scheme in Thailand ensured the coverage of 95% of Thai population by the year 2012 (HISRO 2012). Approximately 97% of the Taiwan population were also covered after the rolling out of the National Health Insurance Scheme (Hsiao and Cheng 2013).

The urgency to extend healthcare to Ghana's population, while shielding populations from unexpected expenditures precipitated by the out-of-pocket healthcare system, compelled the government of Ghana to implement the National Health Insurance Scheme in 2003. This was within the broader resolve of government to deploy proactive mechanisms to protect citizens, particularly, vulnerable populations by maximizing a universal access to affordable and quality health services guided by the principle of effectiveness, efficiency, and client-centeredness. However, the even distribution of health care benefits to promote primary healthcare (PHC) appears to be an Achilles heel in so far as the deployment of social healthcare protection policies by state and nonstate stakeholders in developing countries is concerned (Sulemana and Dinye 2014).

Moreover, health inequities and issues of inaccessibility are reported to restrain certain populations from benefiting. Among such populations are informal workers like head porters. In Ghana, informal sector workers constitute about 80% of the work force (Ghana Statistical Service 2008). The large population of informal sector workers, in the views of Berman et al. (2010), is precipitated by the effects of the Structural Adjustment Programme (SAP) of the 1980s and the ensuing inability of the formal sector to absorb the swelling unemployed population. Generally, informal sector workers are made up of self-employed or employees of entities established by private individuals. These employees are largely not only susceptible to shocks, but also more prone to precarious working conditions. For this reason, they may be exposed to uncertainties, including, but not restricted to, health expenditure uncertainties, which may further have dire consequences on their healthcare access and overall wellbeing (ILO 2009).

And while it is the case that informal workers like head porters have erratic and unsustainable source of income, it is also the case that, as part of the requirements to enjoy the benefits of the insurance scheme, they are required to pay premiums. Given the unlucrative trades, and the unstable incomes flows, head porters are unable to enroll, renew, and access healthcare services. Moreover, while the premium payments do not take into cognizance informal workers, it is also regressive. This makes it possible that a significant percentage of Ghana's population may be left uncovered under the health insurance scheme. Juxtaposing these contexts against the need to cover all population under an effective and efficient healthcare system sufficiently raises concerns about the attainment of universal health coverage goals.

As such, in the pursuit of UHC goals as enunciated under the Sustainable Development Goals (SDGs), it becomes imperative to address hurdles that confront populations, in their quest to enroll, renew, and access health services. The convergence of the hurdles, the probability of neglect of populations, and the urgency to pursue UHC Goals have essentially provided the motivation to explore enrolment, renewal, and healthcare access challenges of head porters in Ghana. On the basis of this study been the first of its kind to be carried

out within the Ghanaian context-particularly unique from a social exclusion perspective, findings generated will furnish policy makers, health sector players, and other stakeholders with relevant pointers and guidelines for decision making towards accelerating and improving coverage.

## Theoretical Underpinning of the Study

The usage of the term social exclusion has recently become too anchored concept in social policy research. The term originated from France (Lenoir 1974) where politicians of socialist provenance used it in reference to uncovered populations under the social security system. During the 1980s in France, social exclusion scope got broadened to include the term "*les eclus*," meaning the outcast of the nations. Social exclusion as a multidimensional concept is complex (Lister 2000). Overtime, the usage of the term has become synonymous with deprivity (Room 1995). Basically, the term lends itself to manifestation of poverty and marginalization characterized by unequal access to resources, rights, and capabilities which is likely to further entrench health inequalities (Popay et al. 2008).

It summarizes a representation of what can happen when people suffer; unemployment, low income, bad housing, and poor health (Social Exclusion Unit and Cabinet Office 2001). A social exclusion paradigm is needed in healthcare-related studies like health insurance operation and utilization among poor populations, especially in a developing country like Ghana. This is because poverty-induced inequity is sharp among poor and vulnerable populations in developing countries. On this basis, the study regards the theory as potent in helping to draw attention and further invite stakeholders to address exclusion in social protection policy deployment lie the health insurance scheme (Kabeer 2006).

Specifically, regarding this study, the social exclusion perspective is considered relevant in unearthing healthcare access-related hurdles, based on which countervailing measures will be identified and subsequently deployed to enhance development and general wellbeing among vulnerable populations like head porters. It must be succinctly emphasized that while healthcare access is challenging for these populations, most head porters are generally unskilled, live under precarious conditions (ILO 2001), and occupy the lower ranks of the workforce structure. As such, it is relevant in interrogating exclusion and correlated issues such as the disadvantages of impoverished populations which can disrupt the efficient functioning of social policies and lead to social isolation or lack of social integration (Arthurson and Jacobs 2004).

The social exclusion theory therefore fosters insight into the policies and measures which enable society to function, while eschewing undertones of deprivation (de Haan 1998). It is for these reasons that social exclusion is often used to conceptualize and/or interrogate social structures which affect poor, vulnerable, and disadvantaged and underprivileged populations. The focus on health insurance may be useful to understand challenges these populations encounter in trying to benefit. From the limited research available, the research suggests that there is likely to be an appreciably more complex social exclusion issue for head porters. Given the relevance of the health insurance scheme, the challenges of head porters and their right to health care, as well as the need to extend healthcare to all without leaving any one behind, it is apparent that on the road to realize UHC by 2030, there are deficits in poor population coverage to be addressed.

## Methodology

### Research Approach and Design

#### Type of Research Design and Inquiry

The purpose of the study was to explore factors of enrolment, renewal, utilization, and health access of head porters. For this present research, qualitative approach was employed to delve deep into knowledge, understanding, and experiences of study participants. A qualitative approach comes with the advantage of aiding researcher to gain much deeper insights into a phenomenon (Thomas et al. 2018). The study also used the

inductive and interpretivist approach. These approaches are suitable for context-specific discourses (Madill et al. 2000). At the same time, they are also suitable for gathering subjective experiences of populations on issues (Bryman and Bell 2015). Interpretivist essentially has two faces: epistemological and ontological. While the epistemological face focuses on subjectivity of knowledge, the ontological is hinged on the fact that the nature of reality varies across individuals (Creswell 2013). Precisely, phenomenological study design is appropriate for understanding the lived experiences of study participants (Zikmund et al. 2013). Therefore, the study used a qualitative phenomenological approach hinged on interpretivism and inductive reasoning. Furthermore, the study used a thematic content analysis to highlight themes and present participants responses. Thematic content analysis as an analysis method helps in the identification and categorization of homogenous entities within a defined context.

## Population and Sampling

### Participants and Sampling

The study participants included head porters in Accra, Techiman, and Kumasi. These participants were heterogeneous in characteristics such as age, gender, religion, and marital status. A total of 150 participants aged between 18 and 55 were interviewed. The study employed a purposive sampling technique to elicit data from 1 November 2019 to 15 January 2020. Giving the relevance of establishing contacts as underscored by Given (2008), as part of measures to introduce the study and the research team, prior to identification of participants, and data collection, preliminary contacts were established with individuals who belonged to the target group. The research team found out from these contacts if they have an organized group. Fortunately, it happened that there existed organized groups. The contacts were further asked to introduce the research team to their respective leaders where possible, for the introduction of the study. After meeting the leaders, a meeting day was arranged for the team to meet the target group, explain the study and its purpose, and also receive their approval for participation, which was willingly granted. The leaders and the team were involved in informing the target group about the study, the need for them to participate, and the how interviews will be conducted. During the meeting with the research group, the research team used the opportunity to recruit participants after which a day was fixed for interview and focus group discussions. Communication and data collection timelines for the various groups are presented in Fig. 1. Participation in the study was voluntary. This approach is convenient method to draw sample by a participant-based method, particularly for underserved populations (Salganik and Heckathorn 2004). The researchers exerted considerable efforts to ensure that many participants were interviewed. This was done with the need to have a maximum variation in the study sample by selecting a diverse population cutting across various sociodemographic divides.

The demographic characteristics of study participants are captured in Table 1. The nature of the study was exploratory. The aim was to uncover issues of enrolment, renewal, utilization, and health access of neglected workers like head porters.

## Data Collection

The present qualitative study used an in-depth semi-structured questionnaire to elicit data. This helps researchers to explore into various issues and experiences of study participants (Marvasti 2004). Prior to interview, participants were briefed on the overview of the study. After being told interview will be held once for all, participants were informed of their liberty to withdraw at any time and stage of the process. Participants were further assured of the anonymity, confidentiality, and privacy of information provided, before giving verbal consent of participation to the research team. Interviews were conducted according to the suggestions of McCracken (1988). In this regard, long interviews were held. This provided the basis for asking questions, probing further, and categorizing participants' responses. Based on this, a thematic interrogation was conducted. The interview guide for the study was reviewed by five researchers adept in qualitative research. Four tertiary student's adept at conducting qualitative interviews was engaged to assist with data collection. These assistants were briefed on the study at a 2-day training workshop. To assess their understanding of the research instruments and data collection techniques, research assistants were engaged in a posttraining pilot test, prior to data collection. The interview guide was subjected to three pilot tests among a sizeable sample of study participants after which the questions were refined in line with the results of the pilot study. These steps were taken to establish the reliability and validity of the questionnaire. The long interview sessions lasting for 25–30 min was similar to prior qualitative research on health insurance conducted by Arkorful et al. (2018). This method significantly offered participants the free will and space to express their views and shed light on the subject matter, while discussing other matters with significant bearing on the study objective (Creswell 2013). Interviews were recorded and transcribed. To establish rapport with study participants, the interview commenced with a warm up question where researchers asked personal and friendly questions interlaced with questions on participants experiences with the health insurance

policy. Based on participants' responses which were oriented towards gathering insights about the health insurance scheme and access to healthcare, the researchers proceeded with the interview. Among some key interview questions posed include: "what do you know about the health insurance?" "what do you think about the policy?" "what are your perceptions about the scheme?" "what issues do you have with the policy?" "how do you see the entire scheme?" "what would you say about the scheme?" "what are your personal assessment of the scheme?" and "do you have any problem or challenge with the scheme?" Further probing questions were posed to gather deeper insights and enrich the data. Among some include the following: "can you explain further?" and "can you give some practical instances or examples?" In the respective study areas, the research team continued with the data collection to a point that participants produced no further relevant data, which marked a saturation point.

### Coding of Interview Data and Analysis

The research team transcribed verbatim the audio-recorded interviews and entered them into Nvivo 11 Plus software. The qualitative responses were thematically analyses. Thematic analysis aids in the identification, analysis, and reporting of various emerging pattern of themes within a data (Braun and Clarke 2006). The responses of study participants captured in utterances and conversations were analyzed to develop patterns, classifications, and themes. At this stage, similarities and uniqueness of individual responses were ensured by the research team. After sorting and familiarization with the data, preliminary coding was done. Afterwards, substantive themes were identified. The themes were further revised to discard codes with lower frequencies and contribution to the research. After disagreements over the development of codes and the final reaching of consensus between the authors, emerging themes were finally developed. The process of coding and theme development was guided by the reflexive thematic analysis procedure suggested by Braun and Clarke (2019). To ensure data credibility and integrity, thoroughness and honesty were ensured. To avoid bias interpretation while avoiding misinterpretation, due consideration was given to reporting participants responses. This enhanced transparency and reporting responses that were true reflection of views shared by participants. Interview analysis was conducted by the authors and later autonomously validated by the other authors who did not participate in conducting interviews. This was to ensure reliability and validity (Mason 2002) and clarity (Richards 2009) of data and at the same time eschew bias and ensure that reports were steeped in participants' actual views.

## Results

The semi-structured nature of the questionnaire design and the qualitative approach of the study enabled participants to provide detailed responses to the interview questions as they are able to reflect and recall instances to buttress their narratives. In all, the study interviewed 150 participants, thus, 50 each from the three study areas of Kumasi, Techiman, and Accra. Forty-five participants were males and 105 were females. The ages of participants were ranged as follows: 18–25, 26–35, 36–45, 46–50, and 51+ years. Most participants were between 26 and 35 years. Majority of the participants has never received formal education. Forty-seven and twenty-nine had received junior and senior high school education, respectively. Christians and Muslims constituted 15 and 116 participants, respectively. Also, 63 participants had a household size ranging from 11 to 15. Most participants (55) had a monthly household income of 51–100 ghc. On the frequency of renewal, 55 and 95 participants were regular and irregular, respectively. Regarding current health insurance status, 51 and 99 of study participants were active and inactive accordingly. Regarding residential characteristics, while 22 participants lived crowded concrete structures, 93 lived in structures made of wood. The remaining 35 were homeless without any defined living space.

Furthermore, data on prior health insurance status showed that 61 were active. The other 89 participants were inactive. And finally, on the

**Health Insurance and the Probable Left-Out: A Social Exclusion-Based Study, Fig. 2** Emerging themes and subthemes on participants views about health insurance enrolment, renewal, utilization, and access

residential status, while 22 participants lived in concrete structures, 93 lived in wooden structures. The remaining 35 were homeless people who had no defined place of residence. The findings presented represent participants' accounts and perspectives. These were structured and categorized into themes, with subthemes captured (Fig. 2).

## Service Quality Perceptions

In gathering responses from study participants, it became apparent that one of the factors that could either encourage or dissuade enrolment, utilization, renewal and further enhance access to healthcare services bordered on service quality perceptions. In the views of participants, the level of services rendered to them should commensurate with the value of investments made (thus the premiums paid). Among some of the service quality perceptions raised include perception about medical supplies, negative attitude of health personnel, and unavailability of health personnel.

### Negative Attitude of Health Personnel, Negative Experience of Relations

Participants recounted that negative attitude demonstrated by medical practitioners towards healthcare seekers is a major factor that dissuades them from enrolling on the health insurance scheme. In the views of participants, in addition to the insults some health practitioners' rain on them, some nurses also discriminate among patients, to the disfavor of health insurance card bearing members. Some subscribers recounted that:

> There was a day a nurse maltreated me in the hospital. I was asked to bring a urine sample for a lab test. On the day of the submission, I entered the room and she shouted at me as though I was a kid. Meanwhile, after that, some other people entered. And they never complained. I asked why? And I was told they are paying from their pockets. Is this fair?

> Some workers at the hospital don't respect health insurance card holders. At the hospital one day, the hospital authorities asked card holders and non-holders to sit separately. By then, I was in a queue close to see the doctor. But when this happened, the siting arrangement changed, and I found myself at

> the back. Why should this happen? We also pay money

Some study participants also indicated that the shared negative experiences of some health insurance subscriber friends are something that discourages them from getting enrolled. Others also stated that their personal ill experiences with card bearers they had escorted to the hospital do not motivate them to enroll. Other subscribers also advanced similar reasons for their failure or inability to renew subscription upon expiry. These narratives resonated with that of others shared during focus group discussion. Some participants said the following:

> What my friends go through, when they go to the hospital doesn't make it appealing for me to enroll. I can get to the medical shop and buy whatever I want. I just need to talk to the one at the counter. They will treat me nicely and serve me what I need, that is better

> Personally, I have been abused several times on my visit to the hospital. From my observation of events, and how I understood them, I think health insurance card bearers are the most abused clients at the hospital. I am not interested. When I am sick, I will buy herbal mixtures or boil some herbs. After taking them for a day or two, I will be fine. Nobody will have the chance to insult me

> My card has expired. But I am not thinking of renewing. To go to the hospital for treatment and find myself disrespected all because I came with health insurance card, then I am not renewing. Using card does not mean I have no dignity. Am not renewing. Insha Allah, am not going to be sick. Allah cares for the poor, not nurses, doctors or health insurance

### Perception About Medical Supplies

Other issues raised by participants bordered on perceptions about medical supplies at the hospitals. In the views of nonsubscriber participants, this offers them enough relief not to enroll. In the case of subscribers too, most participants ascribed their decision not to renew to the type of medications supplied. Almost all participants described the drugs supplied as substandard to requirement. As such, they either do not see the need to enroll or renew their expired subscriptions. As a social protection policy for the poor, participants expressed the notion that it should be done well, with the intention to provide protection to the poor, and not to complicate their health. A participant stated that:

> The drugs covered under the health insurance is not of high quality. They are cheap drugs. Sometimes, they are ineffective. And that is why people sometimes have had to visit the hospital several with same ailment. The drugs are not good

In expressing concerns about the medical supply challenges, some participants went further to express doubts about the efficacy of the drugs provided. Some compared the efficacy of the hospital supplied western medicines with locally manufactured herbal products. Some said that:

> When I went to the hospital, they gave me medicine and i never got well. But when I bought adutwumwaa herbal, after two days, the sickness was gone. So, I think the hospital drugs are not good. Maybe they are expired or not good

Others also shared the views that the prevailing situation whereby essential drugs are not covered under the health insurance scheme defeats the purpose for which the scheme was incepted. On the other breadth, another stressed that in times when pharmacies of health institutions are short of medical supplies, they are asked to get to accredited pharmacies to get the drugs, only to be told either the drugs are not covered or they are finished. For this reason, they are forced to buy. In their view, this discourages enrolment, renewal, and utilization and healthcare access. Participants said that:

> You know, under the scheme, not all drugs are covered. Even though it helps, I don't see the reason why I should renew. There are times that I don't even go to hospital for a whole year. So, if I don't use, I have wasted money. And if I renew, fall sick, go to hospital, and told the drugs are not covered, what is the meaning of this? Needless to renew then

> We were told to subscribe to get free care, but in actual fact, it is not free. We mostly spend more. You know we are poor people. Our work is not lucrative. We don't get much money. So how could we pay this money? Then this is not something for the poor

### Unavailability of Health Personnel

In the views of participants, the number of health personnel at the various health facilities was

insufficient to meet the health needs and demands of health seekers. Participants recounted that the number of health personnel is insignificant that the few ones have had to attend to a huge patient's population. And because this has been the situation, most patients complained of having to spend more time or almost a whole day trying to consult a health practitioner. Others also complained that this situation has mostly created congestion at the hospitals. Under this circumstance, patients claimed that they spend unreasonable hours which they could have used to work and get money to take care of themselves. In regards to this, some participants said that:

> The hospitals don't have enough workers to attend to us. One day, I went to the hospital and they told me, there was no doctor. I had to wait for a long time and doctor never came. I came back home and bought some drugs from the drug store

> There was a day I didn't go to work because I felt slight illness. I went to the hospital to seek for medical attention, and I spent more than eight hours to see the doctor. There was only one doctor on duty

Some participants categorically stated that they do not see the need to enroll on the scheme when there is no assurance of meeting health personnel. Other prior subscribers, who at the time of the interview had refused to renew their insurance, also attributed their decision to the unavailability of health personnel. Some said that:

> My decision not renew is because, there was a day I went to the hospital with my card and never met any health personnel. So, I came home and my friend gave me some drugs. After that, I got better

> Actually, I don't want to enroll because of the problem of medical experts. I once took a friend with health insurance to the hospital, and it was difficult for us to see a doctor

## Time Considerations

Another major theme that emerged from our interaction with study participants was time consideration. Essentially, it was obvious that participants were time conscious. As such, they were much concerned about the unreasonable waste of time at health and health insurance registration centers. Among specific subthemes that emerged include: waiting time at health insurance registration centers, location of registration centers, and time spent at health centers.

### Waiting Time at Health Insurance Registration Centers

Most participants expressed worry about the time spent at the health insurance registration centers. Given that participants were porters, with an unsustainable income dependent on their own productivity, they were worried about the long hours spent in queues at the various registration centers. This issue appeared as a challenge for both the enrolled and prospective enrollees. In the views of most participants, these hours spent are money. And they think these hours could fetch them some Cedis for footing personal bills. In expressing concerns, some recounted that:

> The long queues at the health insurance centers discourages us from registration. Every day, there are so many people there. When I go there, I waste much time. No matter how early I go, there is a queue. Even sometimes, the queue arrangement for the day before continues the next day

> There is always congestion at the health insurance centers. It takes a long time to either register or renew. Staying in the long queue is a waste of time for me. I can use that time to work. If I don't go to work, I cannot pay my rent and buy food and water

### Location of Health Insurance Registration Offices

Further interviews with and subsequent responses from participants underscored the fact that proximity to health insurance registration centers was a motivating factor underpinning enrolment, renewal, and utilization of the health insurance scheme among informal sector workers. This appeared as a common hurdle confronting not only already enrolled populations, but also, potential enrollees. Essentially, they both complained about the long distances they had to travel to access an agent's office. In this regard, some participants who are not enrolled remarked that:

> I don't have much time. I have to leave home as early as 4 am to get to the market to carry goods of my customers. I have little time to walk for long

> distance to locate the agent's office. It's very far from here, am told. I cannot have time to register

Other already enrolled participant whose insurance has expired but still not renewed said that:

> The insurance is very good and helpful. To be frank, I have benefited from the scheme over the years. Mine is expired now, but I feel lazy to renew because the distance from my home to the insurance office is very far

> I don't have time, my brother. I have to cook for my kids, prepare them for school, and leave the house for the market to work. I have little time to walk to the office to renew my insurance. Even when I renew, I don't fall sick, so I don't use. When I have time, I shall renew. Until then, am not going to renew

### Time Spent at Health Centers

Some participants bemoaned the time at the hospital during health seeking times. Actually, some participants attributed the situation to the dearth of health personnel. In the views of most participants, this has been the largest cause of congestion at the health centers. One comment that resonated across the response of most participants was that the time spent at the health centers could have been used for working to get money. And because this has been the situation, any time they think of this, they are discouraged from going to the hospital to seek for medical attention. Some participant stated that:

> The congestion at the hospitals results in waste of time. Most hospitals don't have enough doctors and nurses. Whenever we go there, we spend unreasonable time. We could have used this to work and get small money for our upkeep

> What I have always found painful in my experience with the health insurance and access to healthcare has been the long time spent at the hospital. Any time I think of this, I don't want to go to hospital. This is one reason why I prefer buying drugs from the counter on any day than, going to the hospital

Some other participants recounted on how the issue of congestion at the health centers has precipitated unprofessional and unethical practices like exploitation, bribery, and corruption among health practitioners in the various hospitals. These experiences bordered on the payment of illicit amounts to induce health personnel to facilitate their timely access to the see a doctor. On this note, some participants stated that:

> You know something? At the hospitals, to see the doctor quickly, sick people pay money to health personnel to help them see the doctor. This is not the best because it discourages us from going to the hospital. Why should this happen? And why should sick people be exploited?

> Because some patients want to come home early and don't want to waste time at the hospitals, they pay money to the health professionals to help them access health service. This is the bad thing happening. And it is discouraging people from going to the hospital

## Financial Consideration

### Affordability of Premium Payments

Generally, most participants raised issues about their respective capabilities to raise a substantial amount of financial wherewithal to get themselves enrolled, renew insurance packages upon expiry, and access medical services. From engagements with participants, it became obvious that, because their works were menial, for which reason they make small amounts of money, they hardly could raise funds for premium payments. Some if the comments raised by some participants include:

> The work I am doing is not lucrative enough. What I get on daily basis isn't enough to help me cover housing, feeding, water, electricity and other expenditures. How then can I make enough money to cater for health?

> The money I get from my work is what I send back to my hometown in Tamale to be used to take care of my sick mum, dad and sister in school. It is the same money I use to pay my bills. I am left with little to access healthcare. I wish I could renew my card, but I don't have enough money to do that. i am only praying I don't fall suck

## Discussion of Findings

In the face of the dearth of research focus on the well-being of head porter's healthcare-related studies, the study sets out to explore factors regarding enrolment, utilization, renewal, and access to healthcare of this group in Ghana. To

the best of the knowledge of authors, this is the first study to explore healthcare-related issues of a larger, yet marginalized group in Ghana. Therefore, we are convinced that by advancing valid and reliable evidence, this study will make unique contribution to not only public health policies, but also to the cause of sidelined groups and also inform the deployment of mechanisms to advance their overall human well-being within the context of Universal Health Coverage, as enshrined under the Sustainable Development Goal 3.

The existence of a strong and sustainable healthcare system, complemented with an effective health protection policy, is touted as cardinal to ensuring a healthy population, high productivity, and extending protection to poor populations and subpopulations (Byhai et al. 2015). This is part of the prime reasons why the Ghana health insurance policy was incepted (Arkorful et al. 2018, 2020; Arkorful 2020). However, our study revealed grave policy challenges pertaining to the efficacy of the policy to protect vulnerable populations from the scourge of health-related uncertainties. Precisely, it appeared that these populations, as part of their right to healthcare, encounter challenges. In the face of these challenges, it is obvious that the tendency to extend healthcare to global populations without anyone left outs, as captured in SDG 3, could be significantly impaired.

The results of this study revealed that among service quality perceptions, participants were restrained in terms of health insurance enrolment, renewal, utilization, and healthcare access. Participants confirmed the negative attitude of service providers as a barrier. Participants' perceptions about service providers negative attitude such as insults, rudeness, negligence towards patients, bars both enrollees and prospective enrollees from enrollment, renewal, utilization, and access to healthcare. The study participants by virtue of their status as vulnerable people are discouraged whenever they feel maltreated or not treated with the desired level of respect and dignity expected. These negative perceptions have actually been the cause of patients resort to purchasing unprescribed drugs from unapproved medical outlets. These perceptions actually were revealed to be demotivating. Our finding is consistent with (Arkorful et al. 2018; Ekirapa et al. 2008).

The negative perception of participants about the efficacy and the low to substandard quality of medications covered under the insurance scheme, demotivates enrollment, renewal, utilization, and access to healthcare service. Coupled with this, participant's perception that about drugs not covered under the scheme discourages them. Furthermore, the perception that health insurance card bearing members are served with medications different from what out-of-pocket paying patients are provided with also discourages interest in the scheme. In the views of Arkorful et al. (2018), these perceptions, real or perceived, could further fuel patient's knack for and purchasing intention of uncertified drugs. These study findings are in tandem with Dalinjong and Laar (2012).

Furthermore, our study findings revealed that the dearth of medical personnel at the hospitals, stifle health insurance enrolment, renewal, utilization, and healthcare access. In the views of participants, this situation creates congestion at the hospital. For this reason, they spend longer times in long queues which ultimately affects not only their work routine, but also daily income. The dearth of health professionals, the creation of congestion at health centers, and how these situations demotivate the uptake health insurance-related service are confirmed by Jehu-Appiah et al. (2011). The study also revealed other subthemes that dwelled on waiting time at the national health insurance registration office, location of health insurance registration offices, and time spent at the health centers.

Participants reported of long queues at the insurance registration centers. Some also complained of the long distances they had to travel from their various homes to the insurance registration centers. In a research, Asah (2013) corroborates the effects of these factors on health insurance and other allied services. Aryeetey et al. (2013) in another study also corroborate the strong correlation between perceived service benefits, convenience and service, and posits their

relevance to health insurance service uptake. Quite surprisingly, in sharing views on issues of congestion at the hospital, some participants revealed how this situation has created grounds for unethical behaviors among the rank and file of the health workers. In a study assessing the operational challenges of the national health insurance scheme among stakeholders in Ghana, Arkorful et al. (2018) confirm the prevalence of fraud, financial misappropriation, and exploitation among health personnel.

Given participants consideration for time and proximity, they preferred not to spend much time at the hospitals or health registration centers. In much the same vein, owing to long distances, they are also reluctant to exert much effort in locating health insurance registration centers. The cause of these could be attributed to participants' engagement in menial nonlucrative jobs, with their income flow largely based on productivity. As such head porters would not want to spend much time on engagements other than profiting activities. Factors of geographical proximity to healthcare services and their influence on usage in confirmed by Parez et al. (2010) and Schoeps et al. (2011). Du et al. (2001), Amoah (2014), and Buor (2008) also confirm the centrality of proximity factors to healthcare and service access among underprivileged and poor populations. In their views, the combined effects of these factors induce low patronage among poor populations. The consideration of nearness or proximity of health service dispensing structures to service seekers and their motivation or otherwise to service seekers confirms the validity of the distance decay theory which essentially opines that close things are likely to be used, while distant things are unlikely (Basaza et al. 2008).

The results of the study also revealed that though health insurance enrollment, renewal, utilization, and related healthcare access discourses converge around equity considerations such as affordability for all populations, coverage for subpopulations like porters is unappealingly minimal. Per the study results, the inability for people to afford health insurance was as a result of low income and poverty factors. These underscore possible wrong "targetization" that characterize the deployment of social protection policies (Derbile and van der Geest 2013). Jehu-Appiah et al. (2013) confirm the potency of affordability factors to health insurance service uptake and retention. The inability of populations to afford subscription or renewal entrenches exclusion. In essence, the issue of affordability at this point legitimately brings up the discourse of targetization for discussion. Kotoh and Van der Geest (2016) attribute the inability of the health insurance policy to serve the interest of the poor to the policy framework that actually restricts the framework of poverty characteristics in a way that tends to deliberately exclude the poor from enjoying benefits.

Though equity lies at the heart of the scheme's objective, there are however sufficient of exclusion. This is restraining the policy reach out to the poor who are to get exemption benefits. A critical interrogation of the exemption criteria is constricted to an extent that it disqualifies potential exempted populations. With reference to the 2004 health insurance regulations – which guides the operations of the scheme – specifically LI 1809:59, the parameters for the identification of the poor, among other things, state under regulation 1 (b) that a person shall not be classified as an indigent under the scheme, unless that person does not have a fixed place of residence determined by the scheme. The interpretation of fixed home or homelessness sets the grounds for disqualification of almost everyone in Ghana because the definition of home is set to an abode with a roof. This defeats the purpose of inclusion and equity within the context of health insurance objectives.

This implies that inhabitants in roofed structures are disqualified. Generally speaking, homelessness is a reality that head porters in Ghana contend with on daily basis. From our interaction with participants from their respective places of abodes, it was apparent that, in the best situations where participants lived in rented concrete structures, they were found living in crowded structures. Conversely, in the worst situations, they either lived in dilapidated wooden structures or occupied shops fronts as their

sleeping places. This situation makes it imperative for homeless populations to be covered granted waivers under the scheme. Aryeetey (2012) agrees that homelessness should be prerequisite for granting exemption waivers to the poor. Why the framers of the health insurance regulation would set an exclusion criterion that excludes the poor still remains an unanswered question. To enhance clarity, we intend to commission a study that seeks to interrogate the policy regulation document of the health insurance scheme and how it enhances inclusion, countervails population exclusion, and propels universal health coverage. Summarily, our findings reveal that though the health insurance policy is fraught with potentials, stakeholder's inability or failure to address the challenges confronting poor populations could snail-pace the attainment of universal health coverage by 2030.

## Conclusion

This study sets out to explore health insurance enrollment, renewal, utilization, and healthcare access of poor populations like porters in the Kumasi (Ashanti region), Techiman (Brong-Ahafo region), and Accra (Greater Accra Region) of Ghana. To the best of the knowledge of the authors, this is a seminal study within the Ghanaian context providing valid and reliable streams of study participants-based evidence. These are essential features that set our study apart from other prior health insurance policy-based studies. The presentation of a confluence of wide ranging factors including service quality perceptions, time and financial considerations offers sufficient evidence that health insurance enrollment, renewal, utilization, and health service access of vulnerable populations is underpinned by a myriad of factors which further undermines the attainment of universal health coverage goals, within the broader global framework of sustainable development goals. It is against this backdrop that authors entreat stakeholders to prioritize the issues raised in this study to guide the deployment of measures and mechanisms geared at enhancing inclusion.

## Implications for Policy, Practice, and Further Research

The study has implications for not only policy, but also, practice. Situating the study within the theory (exclusion theory) and the wider precincts of global goals (SDGs) makes it imperative for social policy, especially the need and urgency for government, policy makers, and stakeholders to reduce exclusion by removing barriers to enrollment, renewal, utilization, and increasing healthcare service access. And as the global comity of nations is preoccupied with pursuing universal health coverage to extend healthcare to all people without anyone been left out or behind, an insight into barriers and drivers regarding health insurance would be germane to help provide sufficient policy pointers and guidelines for designing appropriate countervailing measures and mechanisms. The study findings call for the need to take a neck turn to make the health insurance policy more pro-poor than it is now, to forge inclusion. Going forward, future studies on health insurance policy may consider quantitative or mixed studies to further explore the subject matter. Studies in the other regions are also recommended.

## Limitations of the Study

Given that the study focused on head porters in the three cities of; Kumasi, Techiman, and Accra, it is possibly apparent that the conditions of both existing and prospective subscribers as well as the contexts and dynamics regarding the operations of the national health insurance scheme may vary from other geographical areas. Notwithstanding, we are convinced that the drawing of inferences from participants responses, and their juxtaposition with prior findings, which are consistent with our study, reflects the legitimacy of the study and validates the findings. While we entreat a cautious replication and generalization of the findings, we encourage the conduct of further pro-poor studies targeted at contributing insights into the larger framework of health insurance policy.

### Synonyms

Health policy: innovative; Health-care policy in America; Population policy

### Definition

Health policy refers to the governmental guidelines to translate decisions and plans into action to attain the national health goals, reflecting the population's health needs.

Juwel Rana and Fariya Rahman contributed equally with all other contributors.

## Background of Health Policy

Health policy is a holistic charter for maintaining the primary health care requisites such as nutritious food and safe drinking water, individual's access to quality health care services, and their cost, as well as national approach to any natural and man-made epidemic and its reversal. Thus, health policy has an unavoidable impact on an individual's health and the health status of a nation. Throughout the time, many political, philosophical, and economic events set bedrocks for the formation of today's health policies of individual countries (Navarro 2007; Immergut 2001; Gonzalez et al. 2009). The history of health policy is shaped and influenced by three perspectives: professional autonomy, social treaty, and neoliberal or free-market economy (Liang 2002; Walt 1994; Wilensky and Teitelbaum 2020).

*Professional Autonomy:* Since the late nineteenth century to the middle of the twentieth century, the notion and movements on establishing the ultimate authority of medical professions on regulating the health sector signify its position on historical value and shape health policy over the decades. The main argument of this movement was to hold supreme power by the physicians to determine the way and the means of treatments and decide the charge of treatments themselves. This practice includes having the autonomy on deciding which patient to treat, how to treat, which information to pass to patients, and how much money would be charged for any specific treatment. During that period, doctors held a favorable position to policy and lawmakers while designing the health policy.

*Social Treaty:* Social treaty or contract is a counterargument of the professional autonomy movement. This perspective guided the policymaking exactly right after (1960–1980) the professional autonomy movement period. It shifted the focus and benefits enjoyed by the medical professionals monopolistically. This perspective recognized medical professionals as one of the crucial stakeholders of health services rather than the supreme power and established patients' and society's power and role in deciding health expenses and patient care practices. This paradigm was built when civil rights movements and racial inclusion were lingering western, especially in the US air. Therefore, many acts like the Women in Labor Act, the Medicare and Medicaid Act, and the Anti-Discrimination Act in health care against racism got passed and improved health-care access by the general population regardless of socioeconomic background, gender, and race.

*Neoliberal Economy:* The notion of open marketplace and free economy shaped the health sector and related policies at the expense of criticizing the limitation of both previous perspectives – professional autonomy and social treaty – saying that the first one puts doctors in a higher position than patients (scope of severe malpractice and financial loss) and the second one allows patients to overutilize the health care. Hence, from 1980 to the present, the neoliberal economy is dominating the health sector and policy regime. The main idea of this perspective is to have a free health-care marketplace where the agreement will decide the cost of the treatments and services between health-care providers and seekers. The government has limited control over setting the costs of the service. However, few services and subsidies are provided through government funding, mostly in government facilities, and many are through health insurance and non-governmental or company funding. It does not dismiss the need for out-of-pocket expenditure for health-care services for patients. Thus, the neoliberal economy is maintaining an intertwined relationship with the universal health coverage (UHC) paradigm where the government or state is not liable to provide all the health-care services free of cost or ensure the same service at the same cost for all; however, UHC focuses on the importance of having access to health-care services and information for all (A History of Universal Health Coverage in the UN 2019).

## Provisions of Health Policy

Health policy is formulated based on broad provisions such as medical and health-care service provision, public health provision, and bioethics

(Wilensky and Teitelbaum 2020). *Medical and health-care service provisions* determine the facilities an individual is entitled to receive information of access to care (i.e., policy on one's ability to approach health care), health-care financing (i.e., who will and how to pay for the attained care), and quality of care (i.e., the care given in time, efficient and equitable). *Public health provisions* define the government's role and power relationship government practices with private entity and corporation to design and determine health and welfare in association with safety at the population level (i.e., protection from health threats, prevention of disease, and promotion of healthy behavior). *Bioethics* is an intersection point where the discussion over ethics and ethical practices in public health, medicinal and biomedical research, and health takes place to shape individual and organizational morals and societal values. This provision houses many intricate questions and determines a nation's attitude towards complex health issues (i.e., right of abortion, euthanasia, mapping genetic codes).

## Types of Health Policy

Health policy covers a vast area, and it is not easy to accommodate all types of health policy formed, existing, and currently practiced worldwide. Below are the few important types of health policy mostly available in all countries.

*Health-care or medical care policy:* Medical care or health-care policy discusses the process of decision-making, planning, and executing actions to achieve specific health-care goals within health-care settings such as hospitals and clinics. Health-care policy encompasses laws, research, rules, and regulations to improve the health-care experience of related stakeholders such as doctors, patients, and pharmaceutical and health insurance companies. Affordable Care Act and Prescription Drug Pricing Reduction Act are examples of health-care policies (Wilensky and Teitelbaum 2020).

*Public health policy:* Public health policy encompasses governments to prevent disease and control outbreaks and future public health threats. It focuses on the population's health regardless of age, sex, religion, and socioeconomic background (Wilensky and Teitelbaum 2020; Shi et al. 2009). This policy aims to meet health needs and prevent health issues by measuring the disease incidence and prevalence at the population level, providing treatments, and controlling any disease outbreak in the community setting. Health-care financing, health equity, and quality of life at the population level are the usual regimes discussed in public health policy, including vaccination policy and tobacco control policy.

*RMNCH policy:* The reproductive, maternal, neonatal, and child health (RMNCH) policy is an official statement from the government and other authoritative bodies that undertakes all the health areas from specific to broad such as health programs, campaigns, laws, and rules concerning reproductive, maternal, and child health. This policy's main goals are to form, promote, and adhere to essential reproductive, maternal, and child health programs and practices to improve overall health outcomes by reducing RMNC morbidity and mortality. Breastfeeding promotion and family planning policies are examples of this type of policy (WHO 2014).

*Mental health policy:* Mental health policy provides direction and guidelines for better and desirable mental health outcomes at the individual to the community level (Simon 2017). Like other types of policy, it also has specific vision, leading principle, and focused objectives. There are also sets of actions listed in the policy to achieve the decided objectives. It usually houses rules and laws related to mental health promotion, prevention, treatment, rehabilitation, financing, and research protocol. The Anti-discrimination Act and Excellence in Mental Health Act are examples of mental health policy.

## Critical Factors Associated with Health Policy

*Structural Factors*: The main structural factors associated with health policy include the political and economic structure of any country, including intervention at the public setting to form,

maintain, and strengthen structural determinants of health. Structural factors are mostly the inflexible sociopolitical and economic settings, denote the inclusion of the political system, and contribute to the extent that civil society is welcome in policy discussion and decisions (Buse et al. 2012). It shares a relation with the economy such as employment and economic opportunity an individual can avail. For example, the poor-quality cardiovascular disease (CVD) service in Nepal and the high service costs in Bangladesh may influence people from both countries to partake CVD services from neighboring India. It also takes account of environmental benefits and limitations a country owns. For example, China holds a top position for carbon emission, and due to a larger amount of carbon emission, the prevalence of chronic respiratory diseases (CRD) is high there. Therefore, Chinese health policy supports the management of CRD with high priority (Trogen and Xu 2018). These structural components are often vaguely acknowledged in policy and hard to maintain as they work in a community setting. Structural equity and quality, such as stable political atmosphere, balanced economy, lower socioeconomic status, and gender disparities, result in better health outcomes at the population level.

*Social and Cultural Factors:* Social and cultural practices, inequalities, and beliefs of a state often reflect in their health policy (Shi et al. 2009; Buse et al. 2012). For example, if a country suffers from a long-lasting fundamentalism burden, its policy has a greater chance to restrict women from availing health services individually or independently. Socialization and empowerment establish a relationship between individual and community approaches with a sense of shared responsibility to ensure good health at the individual level first and in community settings. This component encourages individuals to adopt a lifestyle or behavior promoting social welfare to improve overall health status, such as using condom at individual levels to reduce sexually transmitted disease prevalence at the community level.

*Lifestyle Factors:* Individual lifestyle and behavior determine individual health. It is often the most visible component of the health policies as policymakers habitually perceive health as an individualistic phenomenon and therefore consider it easy to maintain and deal with (Buse et al. 2012). Most of the world's health policies currently emphasize improving the lifestyle components over the structural components.

*Situational Factors:* Health is influenced by transient and idiosyncratic conditions like flood, drought, and outbreak of any disease, which also influence health policy to act in a certain way (Buse et al. 2012). For example, the global outbreak of COVID-19 infection shifted the health sector's priority and economy to focus and invest more on the services related to respiratory diseases. It again has a hard-wearing impact on culture by imposing social distance and gathering restrictions in communal settings.

## Policy Formulation Process

The policymaking, unmaking, and non-making processes yield an overly complicated, complex, and intertwined circle. There is no one stage or step-by-step process to formulate policy (Walt 1994). However, stages often collide, overlap with one another, and move in a vicious cyclic manner. Policy formulation starts with defining and prioritizing health problems based on available evidence in collaboration with multiple stakeholders. Assessment of an existing policy and development of alternative best options are emphasized in health policy formulation. Then, selecting the best approaches and implementation of health policy is the main step of policy formulation. Reformation options for policy according to the country's health needs should always be appreciated for the best health policy formulation (Seavey et al. 2014).

## Key Players and Stakeholders of the Health Policy

The stakeholder mapping for health policy does not simply draw a square box; instead, it is more brunched and perplexed. The policy elites, technocrats, caregivers, patients, and publics are only

a segment representing players of health policy (Simon 2017; Buse et al. 2012). However, it also contains codification to accommodate both state and non-state actors/groups like private health care and pharmaceutical industry, health insurance companies, social organizations, health researchers, employers, interest groups, and others. For example, to develop a policy on menstrual regulation in Bangladesh, certain actors, e.g., government organizations like the Ministry of Health and Ministry for Women and Child Affairs, nongovernment organizations like Marie Stopes and other faith-based organizations, international organizations like the World Health Organization (WHO) and UNFPA, funding organizations like the World Bank and SIDA, service receivers like the women of reproductive age and service providers like doctors, nurses, and paramedics, and researchers like the reproductive and child health researchers, play a role designated to them through particular power position and practice regime in the policy. Their influence over the policy depends on their perceived position and practice criteria. Power and practice again depend on the agency and structure an individual actor or organization is put into. Agency allows an actor to practice their influence over policy with authority, whereas structure, in contrast, restricts opportunities obtainable to that actor. Thus, the influence of each actor depends on an intertwined relationship between agency and structure. For example, minding the perspective of South Asian countries, mothers and children are important actors for maternal and child health policy. However, considering the lack of agency and unfavorable social structure, often mothers cannot avail the opportunities or services entitled to them by the policy.

## Health Policy Formulation Tools

Countries, regardless of their development status, suffer from bad policymaking experiences. For example, South Asian countries often suffer from bad health policymaking ideas and decisions. Previously, it was determined mainly by the decision of the political elites that rarely is supported by evidence from research. However, in the postindependence period, countries of the Indian subcontinent developed a tendency to follow the health policies of developed countries by emphasizing making tertiary level hospitals in big cities without having a proper maintenance budget. Thus, other preventive health measures often got oversight. Further, years of research developed effective tools to guide policymakers to develop relevant and logical health policies (Buse et al. 2012; Seavey et al. 2014). Three main policymaking tools are discussed below:

*The burden of disease:* The burden of disease draws a clear picture about the disease, disability, and death a specific health problem causes in a broad setting. Therefore, it guides policymakers to determine which health problem should be prioritized in allocating health services and budget.

*Cost-effectiveness of intervention:* The cost-effectiveness of intervention allows policymakers to analyze any intervention's effectiveness and compare the multiple interventions given for a specific health problem. It enables policymakers to modify and adapt the desired intervention that is low in cost and high in yielding better health outcomes.

*National health accounts:* National health accounts shift the focus from the only public expenditure of health and open new opportunities for private health expenditure by introducing policymakers to health insurance, employee's scheme, corporate arrangement, and out-of-pocket expenditure concepts. This helps policymakers decide on how much and which services should be funded by the government and how the individuals should arrange the rest of the service access and costs.

## Policy Implementation Process

It is often regarded as fuzzy to develop a specific health policy; however, implementing health policy in a real setting is even fuzzier. Many policy experts, and scientists often, developed different policy implementation models to understand the

effective way to implement health policy to achieve the best out of it (Wright 2017; Strehlenert et al. 2015). However, summing the simplest form, the health policy implementation process follows certain stages discussed below:

*Initiation of policy implementation by the acting agency:* The acting agency needs to develop a clear and consistent understanding of the policy objectives, needs to have background knowledge, and needs to determine financial resources allocation. It also needs to plan integration within and outside of the acting agency and hire staff to implement the policy.

*Compliance with the policy by target population:* The acting agency needs to install, maintain, and further reform proper and adequate channels to reach the target population. It is also the job of the implementation stakeholders to make a policy output best fitted and sensitive to any target community's local, cultural, and social beliefs.

*Assess the actual impact of policy:* The acting agency needs to understand the bottlenecks and track any existing problem, including technical difficulties, any specific troublesome behavior pattern or diverse behavior pattern of the target group, and the extent of behavior change required to make the policy successful.

*Acquired impact of policy:* Assessing the impact, it is imperative to recognize the non-statutory variables like socioeconomic condition, public support, government support, and leadership skills of the acting agency impacting the policy implementation, and the extent policy could change the health output of the target population.

*Reformation of policy:* After assessing the policy's acquired impact, the acting agency should reform the policy to change the output rate the policy is currently yielding to increase the policy's germane.

## Health Policy and Universal Health Coverage: Health Equity

From the onset of the term, Universal Health Coverage (UHC), coined by the World Health Organization in 2010, like many high-income countries, low- and middle-income countries are also thriving to achieve universal health coverage to improve population health (A History of Universal Health Coverage in the UN 2019). The main idea of UHC is to ensure access to quality and affordable health care for everyone, everywhere. Since then, WHO is urging all nations, international concerning bodies to focus on implementing UHC as national agenda and translating it into policy to provide quality health service access, particularly for the most impoverished community focusing on primary health care and social protection mechanisms. UHC is often promoted to integrate the concept of health equity in health policy; however, it is not easy to establish a difficult endeavor such as UHC into an already complex health system. Although UHC defines a broad outline for health service allocation, it vaguely touches the means of ensuring the health service quality and access and does not give proper guidelines about each stakeholder's role, including but not limited to the government, the beneficiaries, and the interest groups. Further, it lacks defining and addressing how to tackle financial and quality variation of service across the globe and does not talk with clarity on how to ensure the financial security one might have to access to the existing health services. If the gaps beneath UHC ideas are not properly addressed, it is very unlikely that UHC can come as an aid to ensure health equity for all.

## Successful Health Policy

Countries from different continents adopt different health policies depending on the socioeconomic and cultural background they reside on. To stretch the statement, one may focus on the policies acquired by the United States (the USA), United Kingdom (the UK), Nordic countries, and South Asian countries (Chen 2016). The USA embraces policies that are most influenced by neoliberal economic agenda, hence focusing more on the privatization of health care and, on that account, sometimes

limiting one's access to health-care services if not covered by health schemes like Medicare and Medicaid (Chen 2016). On the other hand, the UK emphasizes more on welfare health policy covered by the National Health Service (NHS) umbrella where services are free of cost (Grosios et al. 2010). However, this system struggles to satisfy service recipients in terms of service quality and patient waiting time (McIntyre and Chow 2020).

On the contrary, Nordic health-care policy intensifies the social welfare model's dual need that houses the notions of universalism and equity (Magnussen 2009). Therefore, it has a balanced feature covering egalitarian ideology that mainly shares the low level of shared cost and high tax-based health service financing. Contrarily, South Asian countries often struggle to form and implement any specific health policy due to corrupted imprudent behavior from high officials and lack of will to incorporate evidence and research-based findings into policy. Further, many times, health policies in this region, including India and Bangladesh, are often formed with inadequate knowledge about the existing bottlenecks at the community level, for example, the legislation of iodized salt policies in India and Bangladesh (Van Weel et al. 2016).

## Conclusion

Challenges in health policy implementation are due to negligence towards innovation and research, advancement of technology, globalization such as digital health and privacy of electronic health records, advancement of molecular biology, and health of migrants and immigrants.

## Health Policy: Innovative

Christopher Stream, Justin Gardner and Jason Wasden
Greenspun College of Urban Affairs, School of Public Policy and Leadership, University of Nevada, Las Vegas (UNLV), Las Vegas, NV, USA

### The Role of Government in Healthcare

Even a cursory understanding of federalism can help clarify how state and local health policies often come to fruition within such governance systems. For example, in federal systems, (i) power is divided between central, local, state, and regional governments (Wilson and DiIulio 2007); (ii) central and constituent governments act directly upon their citizens; and (iii) direct democracy is often at work (Direct democracy occurs when governments are unable to meet the expectations of their communities and are consequently acted upon by them (e.g., via the development of interest groups, grassroots campaigns, and potential legislation that may be placed on ballots in states where referendums are permitted)). This federalism lens can be used to explain healthcare changes at various macro levels of government. For example, researchers have used it to demonstrate that safety-net hospitals (within federal systems) require financial support from local, state, and federal governments to provide consistent care to their constituents (Meyer 1999). In fact, Meyers has concluded that while safety-net hospitals focus on optimizing their resources, they would nevertheless likely collapse without government funding. Furthermore, when local governments spend money to promote healthy populaces, they reduce the burdens on county-level, safety-net hospitals (via reductions in the numbers of emergency room visits) (Fig. 1).

In the United States, there has been extensive debate over the role of the federal government in healthcare (e.g., via considerations of correlations between spending and the federal budget). During the 2015 fiscal year, Medicare spending accounted for 15% of total federal spending (Henry J. Kaiser Foundation 2016) and Medicaid spending increased by 13.9%, on average – largely due to new enrollments (which, on average, increased by 13.8% across all 50 states and Washington, DC, and were largely associated with the ACA) (Henry J. Kaiser Foundation 2016). In 2012, Medicare and Medicaid outlays totaled $733 billion (i.e., $478 billion for Medicare and $255 billion for Medicaid) within the president's proposed total budget of $3.7 trillion. Medicaid also imposes large financial burdens on states (Weil 2003). Indeed, many states are now facing uncertain financial futures (Weil 2003), which is partially due to demands by the federal government to increase Medicaid programs in return for certain federal subsidies.

The Patient Protection and Affordable Care Act (PPACA) requires states to increase Medicaid spending by 1.25% above what was projected between 2014 and 2019 (Angeles and Broaddus

**Health Policy: Innovative, Fig. 1** Wilson and DiIulio's depiction of federalism (Wilson and DiIulio 2007)

2010). Since 2014, the new health reform law has also required states to expand coverage to individuals at 133% (vs. 235) of the poverty level; however, the federal government will absorb 96% of the costs of Medicaid expansion over the next 10 years, according to estimates from the Congressional Budget Office (Angeles and Broaddus 2010). Currently, states pay 57% of the costs; however, by 2020, the federal government will pay 90%. Indeed, over the next ten years, $434 billion of the costs of Medicaid expansion will be borne by the federal government and $20 billion will be borne by the states. By comparison, if states had been required to pay 43% of the costs, they would have ended up paying $195 billion (Angeles and Broaddus 2010).

As previously noted, the federal government also requires, via the PPACA, that states expand Medicaid to nonelderly individuals whose income is at 133% of the poverty level (or roughly $29,000 annually for a family of four) (Angeles and Broaddus 2010). However, this still leaves a gap in comprehensive, primary, and preventative healthcare coverage for working Americans who do not qualify for Medicare and Medicaid and do not work a sufficient number of hours to be covered by employer-provided health insurance policies. A reduction of 32 million in the number of uninsured people by 2019 will thus be attained via (i) the expansion of Medicaid and (ii) new premium credits (for individuals with incomes that are too high to otherwise qualify). Considering the changes to political environments since 2010 and major themes of the 2016 election cycle, significant modifications to PPACA can be expected before the next mid-term elections in 2018.

## Federalism in Healthcare Policy Innovation

Current implementation parameters of PPACA, as previously discussed, partially aligns with a Federalism approach through the requirement of Medicaid expansion by 1.25% in exchange for matching federal program dollars. Indeed, the federal system of governance in the United States necessitates that comprehensive healthcare policy attain a dynamic balance between the goals of the federal government and capacities of state and local governments to serve their constituencies. However, the aftermath of the Great Recession has made it more challenging for states to expand such services due to repeated budget cuts. While still driven by federal mandates and requirements, PPACA implementation structure offers an opportunity for policy revisions to further the federalist implementation structure to empower states with state-driven health policies and program design. Multiple Streams Framework (MSF) provides a robust lens of analysis to explain the advent of PPACA in 2010 with respect to both historical incremental changes in health policy and the opportunity, "policy window", for innovation in 2010 (Zahariadis 2007). The application of MSF to PPACA 2010 as displayed in Fig. 2 from a retrospective perspective also affords a predictive glimpse into the future of PPACA. Building from Fig. 2 and considering the current state of political affairs at the federal level following the 2016 election cycle, there is a substantive case to be made for a Federalist approach in any changes to PPACA.

## Incremental Changes

Indeed, the United States has experienced myriad healthcare evolutions over the past century. Prior to 1910, healthcare was often restricted to home remedies – even certain surgeries were performed at home. The Flexner Report confirmed the newfound popularity of evidence-based medicine in 1910; however, 19 years would pass before the widespread utilization of private insurance. In 1935, policy wheels were set in motion that would eventually lead to the adoption in 1965 of Medicare, which is a federal single-payer system and provides healthcare coverage to the elderly (i.e., 65 years of age and older) and disabled. Medicaid was also signed into law in 1965 and provides healthcare to indigent and disabled Americans (who previously received institutionalized care) (Medicaid 2003). Soon afterwards Health Maintenance Organizations (HMOs) would begin providing enrollees with a range of medical services from approved providers. This was followed by the creation of Preferred Provider

**Health Policy: Innovative, Fig. 2** PPACA, 2010 Health policy innovation from multiple streams framework lens

Organizations (PPOs) in 1980. In 1997, Diagnostic Related Groups (DRGs) were created and standardized the compensation of hospitals. Twelve years later, the PPACA was adopted. Within 6 years of PPACA adoption, major shifts in political power have occurred and successful campaigns in 2016 promised significant changes to current health policy. The next innovation in health policy should be anticipated before the next mid-term election and ought to involve a Federalist approach to empower state and local government healthcare innovation.

## A Case of Local Government Healthcare Innovation

Rosenbaum et al. (1998) have suggested that the federal government should continue providing funding for healthcare. Indeed, US emergency rooms, nationwide, are currently providing medical and sometimes dental care (e.g., oral surgery) to the working poor and indigent. However, there are myriad considerations when determining appropriate amounts of funding and levels of responsibility. For example, should the federal government continue providing such support during tough economic times? How should such funding be allocated relative to other comprehensive needs (e.g., the car allowance rebate system (CARS), bailout of banks and automobile industry, involvements in undeclared wars, and other foreign interests that require strong military presences)?

Additionally, the federal government is far removed from the general population and thus cannot know the needs in every part of the nation. Thus, state and local governments are primarily responsible for providing comprehensive healthcare to the indigent (Rich and White 1998). They (vs. their federal counterparts) are much closer to such constituencies, have better

knowledge of their needs, and are familiar with the associated regions. Therefore, a further exploration of the methods for providing comprehensive and preventative healthcare at the local level can potentially help further reduce health problems for enrollees and expenses for county taxpayers.

Currently, local and state governments (i) work to meet the healthcare needs of the indigent, working poor, and uninsured; (ii) typically utilize county hospitals to enable this level of healthcare; and (iii) push associated healthcare costs down to the counties and local governments. In response, many local governments have partnered with nonprofit and private healthcare providers. This type of purposeful collaboration often strengthens the abilities of communities to apply for federal support via grants, which can potentially promote statewide healthcare industries, new healthcare innovations, and stronger financial foundations for associated healthcare systems. Thus, it is common for counties to partner with external providers that can provide healthcare services and govern and financially support hospitals in their communities. As previously mentioned, Rosenbaum et al. (1998) have suggested that the (i) federal government needs to provide significant funding for community health-center models and (ii) states should continue supporting them. During tough economic times, the federal government should also contribute additional financial support via provisions of subsidies in medically underserved communities and thereby make up for losses accrued by states and ensure that care can be provided to those who do not otherwise have access.

## Federal, State, and Local Government Healthcare History

Considering the current status of health policy and potential changes in the near future, it is important to understand the history of health innovation. This historical assessment offers both reasons for policy changes as independent events and an example of system-based policy incrementalism. The Health Insurance Portability and Accountability Act (HIPAA) was signed into law in 1996 and its concept of administrative simplification was subsequently expanded upon in the Patient Protection and Affordable Care Act (PPACA) – commonly known as the Affordable Care Act (ACA). Furthermore, the Supreme Court determined that the new act's individual mandate could be thought of as a tax, as part of its ruling on *National Federation of Independent Business,* et al., *v. Sebelius, Secretary of Health and Human Services,* et al. on June 28, 2012. Thus, since Congress has the authority to levy taxes, a mandate for all citizens to participate in the act would be permissible. The PPACA also requires states to (i) expand Medicaid coverage to non-elderly individuals whose income is at 133% of the poverty level (or roughly $29,000 annually for a family of four) (Angeles and Broaddus 2010) and (ii) increase Medicaid spending by 1.25% above what was originally projected between 2014 and 2019 (Angeles and Broaddus 2010), which is further detailed below.

## Comprehensive Healthcare Innovation

Comprehensive, primary, preventative healthcare is a system of care that provides primary medical services, dental benefits, and preventative care to participants and includes health coverage for primary/preventative care, prescription medication, dental care, vision, outpatient hospital services, physical therapy, immunizations, disease management, durable medical equipment, family planning, chiropractic care, occupational therapy, and speech therapy (Wasden 2012). However, the disjointed and incremental US healthcare system relies on employers to provide insurance to their employees; thus, (i) this system is often taken for granted by those who have health coverage, (ii) the under- and unemployed often go without coverage, and (iii) a significant percentage of the US population goes without healthcare due to associated costs (Davis and Rowland 1983). In fact, by the time the uninsured seek treatment, they most often require hospital emergency room (ER) care. Universal access to comprehensive, primary, preventative care would likely reduce

the utilization of ERs as primary forms of healthcare for the uninsured and underinsured (Grumbach et al. 1993).

During the Reagan administration in the 1980s, many states showed a commitment to ensuring adequate provisions of healthcare services to their citizenry (Rich and White 1998) as the federal government cut healthcare funding. The Reagan administration intentionally created a gap in the healthcare system (Rich and White 1998); however, it incorrectly predicted that the private sector would sufficiently fill it. Comparisons of the rates for nonelderly, uninsured Americans from 1987 to 1996 reveal that this uninsured population has grown, is less likely to use preventative care, and is more likely to pay for preventative care out-of-pocket (Taylor 2001). Nevertheless, by the end of 2015, there were approximately 28.5 million uninsured nonelderly Americans in the United States; this was a decrease of approximately 13 million since 2013 (Kaiser 2016). Thus, the passage of the PPACA appears to have significantly narrowed the gap in healthcare coverage.

Since cost can still be a barrier, more healthcare coverage does not necessarily mean greater access to care (Long et al. 2011). Furthermore, single entities cannot solve the more significant issues (e.g., the need for better access, quality, and cost control) – especially within the complex, disjointed, continuously evolving, incremental system of healthcare in the United States. Indeed, there must be intentional collaborations between the federal government (Medicare), state governments (Medicaid), county governments, private for-profits (Blue Cross Blue Shield), and private nonprofits (e.g., health centers) that can promote effective, structured, focused, and cooperative partnerships. These collaborations have the potential to help reduce (or eliminate) gaps in the current healthcare system and include the nine-year-old Florida Health Choices, which (i) involves a purposeful collaborative between nonprofit and governmental organizations; (ii) helps provide nonelderly individuals – who are employed and underinsured – with comprehensive, primary, preventative care; and (iii) could enable the provision of such care to even more enrollees via partnerships with the state and federal government.

## Healthcare Policy Environment

Before the Great Depression (1929–1939), healthcare was an out-of-pocket cost for Americans and indeed much less expensive than what is seen today. The "Blues" (i.e., Blue Cross Blue Shield) (i) were created (Sultz et al. 2014) in response to threats of government expansion into healthcare during the Great Depression of 1929, (ii) provided private insurance that could be purchased by individuals, (iii) offered health insurance policies that cost 50 cents a month, and (iv) made it no longer necessary to anticipate and save for possible future medical costs associated with end-of-life care (Sultz et al. 2014). Thus, health insurance was a relatively new concept during this era; indeed, some physicians initially rejected it because they felt that individuals could save sufficient funds to cover their healthcare costs.

Healthcare costs increased long after the Great Depression due to the establishment of Medicare and Medicaid (in 1965) to cover the aforementioned, underserved populations (i.e., the elderly and indigent) (Sultz et al. 2014). Nevertheless, healthcare providers were beginning to reap great financial benefits from the establishment of health insurance firms (which began to charge higher-than-necessary rates) (Sultz et al. 2014). However, physicians have more recently claimed that they cannot profit from providing care to Medicare and Medicaid patients and their provider compensation levels are falling overall (Rich and White 1998). For example, insurance companies now contract with HMO and PPO organizations that subsequently contract with providers who offer qualified services to their enrollees. Thus, this type of care has also evolved to contain health insurance costs.

The HMO Act was adopted in 1973 and required employers, with 25 or more employees, to offer federally certified HMO options if the employer offers traditional healthcare options. HMOs grew rapidly from 1992 to 1999 (Sultz

et al. 2014); however, one major problem for HMO participants is that they cannot choose specialists without referral recommendations from their primary care physicians. This led to the physician-created PPOs in 2001, which (i) allow individuals to consult with specialists directly, (ii) provide better reimbursement rates for physicians (Sultz et al. 2014), and (iii) sometimes require a primary care physician to be assigned to a patient. By 2002, PPOs had captured more than 50% of the private health insurance market (Sultz et al. 2014).

## Healthcare Education and Nonprofit Donations

Before the growing prevalence of formally trained physicians in the nineteenth century, homemakers often addressed the healthcare needs of their families via the utilization of herbal remedies that they likely often learned from family members, friends, and other community members (Sultz et al. 2014). In 1893, Johns Hopkins Medical School opened its doors and was the first school to require 4 years of medical training. The other prominent medical schools in the country, such as Harvard, subsequently followed the lead set by Johns Hopkins, and these institutions ultimately set the standard for medical education across the United States (Sultz and Young 2010). While foundations and wealthy individuals supported medical schools during this time, schools with more favorable reports received most of the available funds and the majority of such schools were affiliated with universities (which had significant influence on medical education and its path towards an evidence-based healthcare model) (Sultz et al. 2014). Also, the Carnegie Foundation published the "Flexner Report" in 1910 (Flexner 1910) in *Medical Education in the United States and Canada* in 1910, which not only detailed abuses in medical schools (Sultz et al. 2014) but also shifted the focus of healthcare education towards evidence-based care. Prior to the report medicine was not centralized, medical education was not standardized, pre requisites for admission did not exist, the scientific method was not the standard for education, medical schools were not always affiliated with hospitals, and states did not regulate licensure of medical professionals.

During this time, there were still many individuals who could not afford healthcare (Sultz et al. 2014) and when the government threatened intervention in 1929, private insurance emerged (Sultz et al. 2014). Nonetheless, private insurance companies (Sultz et al. 2014) would ultimately begin to refuse insurance claims for procedures and treatments that they deemed unnecessary or due to pre-existing conditions; this, in part, led to the creation of HMOs. As previously noted, physicians subsequently formed PPOs when they saw the government getting involved in healthcare. However, from 1910 to approximately 1973, most physicians had very lucrative careers that did not involve extensive government intervention.

## Education and Physician Shortages in Rural Areas

There is currently a shortage of healthcare professionals worldwide (Clark et al. 2006), a migration of such professionals from the least to the most developed countries (where they can earn better wages), and migrations of healthcare professionals from rural to urban areas within developed countries (e.g., the United States) (Ricketts 2000). US healthcare educators are attempting to address the problem of shortages in rural areas. Furthermore, researchers have identified factors that both attract and dissuade healthcare professionals from entering rural practices (e.g., reasonable working conditions and spousal factors) (Rourke 1993). Still, the complexities within US healthcare – and the associated health education – systems have made this challenging.

One of the challenges is to maintain the standards of healthcare implemented after the Flexner report was issued. There were many medical schools operating in rural communities prior to the Flexner report. The problem at the time was there was not state regulation on licensure for

medical professionals or education. Now many of those problems have been solved and some of these rural locations may be ideal places to locate medical schools providing there is a patient base large enough to sustain the needs of medical educators.

## Collaboration in Healthcare

There is a large body of literature that focuses on the need for healthcare professionals to collaborate via interdisciplinary practices. For example, current collaborations in nursing and dentistry help to address the oral health needs of elderly patients (Coleman 2005), researchers have been able to address certain disparities via dental and medical collaborations (Mouradian et al. 2003), and collaboration models show how system dynamics can help communities organize cost-effective care for chronic illnesses (Homer et al. 2004). Thus, it is very apparent that collaborations will remain important – now and in the future of healthcare (Fuchs 1996). Physicians (vs. corporations) should ideally lead such collaborations, collaborate with participants system-wide for the benefit of patients (Fuchs 1996), and generate good – but not excessive – profits. Indeed, the need for collaborations among healthcare professionals is quite significant now due to (i) increased complexities within healthcare and healthcare education systems and (ii) the fact that comprehensive government control has a limited ability to solve the myriad of issues in modern-day healthcare (Fuchs 1996). Leathard (2004) also notes that collaboration is necessary for complex, international healthcare systems as well.

As healthcare professionals work with one another to optimize patient health, their partnerships could result in more efficient and quality healthcare. Furthermore, when healthcare providers concern themselves with values and collaborate with stakeholders, they tend to provide more personalized attention, concern, and guidance; as a result, their patients are better informed, motivated, and thus positioned to attain better health outcomes (Fuchs 1996).

## Conclusion

The US healthcare system is unique, complex, and massive and consists of various components and players that are interdependent and yet often incompatible. Market forces, the political need to care for vulnerable populations, and fragmented healthcare systems have generated intermittent demands for system-wide changes and required significant amounts of time, compromise, and persistence. Furthermore, there have been extensive debates in the United States over the (i) role of the federal government in healthcare and (ii) correlations between spending and the federal budget. For example, while federal systems involve a division of power between central, state, regional, and local governments (Wilson and DiIulio 2007), many states in the United States are now facing uncertain financial futures (Weil 2003) due, in part, to demands by the federal government to increase Medicaid programs (in return for certain federal subsidies). Revisiting the presentation of MSF applicability to the 2010 adoption of PPACA with respect to current political climate, an opening of a policy window for modifying PPACA could offer an opportunity for a Federalist approach to health policy (Fig. 3).

A substantial difference from the 2010 MSF assessment of the adoption of PPACA can be seen in the Policy Entrepreneur area where health insurance contributions to Democratic campaigns in preceding election cycles in 2010 have been replaced by national mood, higher than anticipated health costs, and fall-out from the 2016 election cycle. The 2010 adoption of PPACA was supported by several health industry agencies to create the HMO-based exchange health insurance options; there was little interaction with states outside of previously noted Medicaid expansion incentives. As previously posited, the 2016 election outcomes, campaign promises, and pressure from American voters will open a policy window and another opportunity to incrementally innovate health policy. Based on Fig. 3, there is a significant opportunity for health innovation to apply a Federalist approach to designing a market-based federal health policy that empowers state governments to administer the modified policy.

**Health Policy: Innovative, Fig. 3** 2016 multiple streams framework policy window for health policy innovation

The federal government could work toward solving many of these issues via collaborations with private for-profit enterprises, nonprofit organizations, state and local governments, and the input of associated stakeholders (e.g., voters, insurers, and providers). For instance, there would have been less conflict associated with the implementation of the PPACA (i.e., the ACA) if President Barack Obama had the support of the public before proposing such significant changes. Indeed, many Americans did not like the individual mandate that forced them to obtain health insurance; however, they looked favorably upon other parts of the act (e.g., their ability to (i) keep their children on their insurance plans longer and (ii) obtain health insurance with pre-existing conditions). President-elect Donald J. Trump will now have the opportunity to preserve positive aspects of the ACA, address some of the original issues, and resolve many of the other concerns delineated herein. A market-based Federalist approach to designing any adaptations or replacements for the ACA would be the next best innovation in health policy and offers the highest amount of state-to-state customization in an effort to provide quality and affordable health insurance and care to more Americans.

## Introduction

In June of 2014, the Port of Spain Municipal Cooperation celebrated 100 years as an institution. Part of its remit is maintaining the Public Health (PH) of the capital city as well as setting trends and exerting influence on the wider community. Its core activities are enshrined in the Public Health ordinance Chapter 12, No. 4 of 1952, which exists to this day, unchanged. PH like all sciences must evolve with time as articulated by Rosen (1958), and as such this paper attempts to capture the achievements of the past 100 years PH practice in Trinidad.

## The Period 1914–2015

In 1914, Trinidad and Tobago (TTO) was a colony in the British Empire and therefore under colonial rule. Between 1914 and 1950, there was much turmoil; the world had experienced two world worlds and a global economic depression, which negatively impacted on social conditions and the delivery of health care. The labor riots of 1937 and the appointment of the West Indian Royal Commission in 1938, commonly known as the Moyne Commission, all impacted on health care in Trinidad.

One of the earliest challenges was the elimination of hookworm infestation. Through a system of chemotherapy, sanitation, the construction of pit latrines and health education during the period

1914–1925 hookworm was successfully eliminated as public problem (Tikasingh et al. 2011).

The next successful challenge was the eradication of the scourge of smallpox. TTO joined the smallpox eradication effort started by the World Health Organization in 1958 and by 1980 celebrated with the rest of the world in achieving the global eradication of smallpox. On 8 May 1980, during the eighth plenary meeting of the 33rd World Health Assembly, the president of the assembly, Al-Awadi, signed resolution WHA 33.3, which declared: "Having considered the development and results of the global programme on smallpox eradication initiated by WHO in 1958 and intensified since 1967 . . . Declares solemnly that the world and its peoples have won freedom from smallpox" (World Health Organization 1980; Fenner et al. 1988). Three important factors contributed to this success: (1) the vaccine used that was a heat-stable, freeze-dried vaccine allowing long-term storage without refrigeration, (2) humans who are the only known reservoir for the virus, and (3) the cost of eradication and the high level of social and political commitment supporting the initiative.

In this period also, rabies, malaria, and tuberculosis also had to be confronted as well maintaining control of cholera. Although the last case of cholera occurred in the mid-1880s, continued vigilance was imperative. This surfaced in 1992 when cholera was reported in Venezuela, on 31 January 1992 (Pan American Health Organization 1991). Venezuela is only seven miles west of Trinidad, and there are frequent travel and trade between the countries, which created a real threat. A strategy of (1) intensifying the surveillance of diarrheal diseases, (2) strengthening the inspection of food offered for sale, and (3) providing public education and heightening public awareness, all basic PH strategies proved successful (Hospedalas and Holder 1993). Cholera did not occur in Trinidad and has not occurred in the past 100 years, which can be attributed to successful PH efforts. The first and only epidemic of rabies occurred between 1923 and 1937, which resulted in 86 deaths (Chadee et al. 1992). In this epidemic, Pawan in a seminal paper established through several experiments the transmission by bats (Chadee et al. 1999). Although malaria was successfully eradicated from Trinidad since 1964, several imported and autochthonous cases have been reported emphasizing the importance of malaria control (Mungrue 2010; Pawan 1936). Yellow fever (YF) has also significantly impacted on PH practice in Trinidad. Monath reported 15 cases in 1954 (Monath 1989). Although the last reported case was in 1979 primarily due to effective immunization strategies, Trinidad continues to experience only repeated epizootics of yellow fever virus (YFV). It is clear that YFV in Trinidad is maintained for relatively long periods, and Auguste and colleagues have hypothesized that epizootics emerge from viruses maintained in enzootic cycles. This however is contrary to observations of less synchronous epizootics in the Americas and raises the issue of what mechanisms could account for this. There is currently no definitive answer, but the mechanisms are likely to involve complex interactions among multiple factors (Auguste et al. 2010).

Tuberculosis (TB) has had a long and continuing PH impact in Trinidad. The first and only West Indian Inter-Colonial Tuberculosis Conference of 1913, "The Tuberculosis Control Act (Ch 28:51)" of 1961, the discontinuation of BCG vaccine, the closure of the Cura sanitorium, and the arrival of HIV are only a few highlights of its impact. Consequently, it is beyond the scope of this study to address all the issues. Nevertheless after making huge efforts to control TD, in 2010, WHO reported that Trinidad and Tobago had the highest (30%) prevalence of HIV among incident TB cases (i.e., 25 per 100,000 population in the Americas (Tuberculosis in the Region of the Americas. Regional Report 2011).

While measles created an important challenge to PH in the 1980s, there were significant epidemics of rubella also. One such epidemic in 1983 reported 1159 cases and 20 neonates delivered at the Mt. Hope Women's Hospital between November 1982 and July 1993 were diagnosed with congenital rubella syndrome (CRS) (Rosen 1958). The public health burden of rubella is related to the risk of infection in pregnant women. In 1991, Lewis and Potter reported that 46.4% of a sample of 1838 pregnant women were negative for rubella antibody, a surrogate indicator of the potential risk for CRS in a population

(M. J. Lewis and I. Potter, Caribbean Epidemiology Center, unpublished data) (Orenstein et al. 1985). Thus, in 1988, the ministers of health of the Caribbean Community (CARICOM), a grouping of 13 independent states and six UK Caribbean overseas territories and Suriname, resolved to eradicate indigenous cases of measles from their countries, by means of mass vaccination targeting children 9–14 years. This resolution was implemented in May 1991. The measles, mumps, and rubella (MMR) vaccine (Schwarz strain of measles, Wistar RA-27/3M strain of rubella, Urabe strain of mumps) was used as it not only targeted measles but rubella and mumps. The occurrence of measles, mumps, and rubella in subsequent years (1994–2004) is shown in Table 1. There were a few sporadic cases of mumps between 1994 and 1999. Suddenly in 2000, there were 650 cases, which occurred predominantly among the age group 25–44 and among males than females (Table 2). This pattern continued in 2001, 2002, and 2003. There were no reported cases in 2004 (Fig. 1) (small number of cases between 1 and 5 not captured in the figure). Other vaccine-preventable diseases, i.e., neonatal tetanus, tetanus, pertussis, and diphtheria, have not occurred in Trinidad in the past 25 years. Polio is now eradicated from Trinidad as we partner with the rest of the world in efforts to achieve global eradication.

Public health over the past 100 years has had enormous triumphs in the field of infectious disease control, as illustrated by the elimination of hookworm, smallpox, malaria, cholera, typhoid, yellow fever, and the vaccine-preventable diseases such as measles, mumps, rubella, poliomyelitis, diphtheria, tetanus, and pertussis. The reduced burden of these infectious diseases, which were rampant during 1930–1950, can be attributed mainly to socioeconomic and PH interventions such as sanitation, water and food safety and improved nutrition, and living standards, all of which are standard public health practices.

In the last 50 years between 1950 and 2000, IMR was reduced by 80%, falling from 69.9 to 13.1 per 1000 live births. Over the same period, standardized mortality ratio also declined from 16.4 to 3.8 per 1000 population. Life expectancy increased from 56.3 to 68.2 for men and 58.5 to 73.6 for women. This is against a background in which GDP per capita rose from 407.8 (USD) to 19,800 (USD).

Globally, life expectancy doubled during the twentieth century (Riley 2005), largely as a result of reductions in child mortality attributable to expanded immunization coverage, clean water, sanitation, and other child-survival programs (Fenner et al. 1988). During the period 1960–2014, life expectancy in Trinidad increased among women from 64.3 to 74 years and 61 to

**Health Services at the Primary Care Level, Fig. 1** Number of cases of mumps reported by year since the start of the mass vaccination strategy

65 years in men; this gain can in part be attributed to public health interventions.

The epidemiologic transition from infectious diseases to chronic noncommunicable diseases (CND) in Trinidad and Tobago occurred as early as 1947 Mungrue (2012). The rising burden of CND particularly diabetes, hypertension, obesity, cancer, and injuries poses a challenge for all public health systems and requires innovative approaches to effectively improve population health. Tobacco use alone kills more than 5.4 million people per year – more deaths than HIV, tuberculosis, and malaria combined – and nearly 80% of these deaths occur in low- and middle-income countries [51]. If left unchecked, it is estimated to rise to eight million per year by 2030. Hypertension is the only condition that kills more people globally than tobacco use – more than nine million per year. CND pose a particular challenge to public health systems because of their multifactorial nature and the strong links to lifestyle-related factors such as smoking, diet, alcohol use, and physical inactivity, some of which arise from global environment. In the words of Richard Coker, "globalisation, inequality, migration, ecological shifts – these are the challenges facing public health today." No isolated institution can confront these massive societal forces; it will require a global response. Hence, the current core operations of traditional public health functions have become too narrow for this challenge. Public health must now engage with the broader spectrum of social, political, and economic foundations that determine population health.

## Conclusion

In conclusion much has been achieved over the past 100 years. A better understanding of diseases and scientific discoveries such as vaccines, penicillin, and streptomycin led to dramatic decline in both the morbidity and mortality of many diseases in Trinidad. The ambitious goal is to end the epidemic of HIV/AIDS by 2030 through the 90-90-90 strategy – i.e., 90% of HIV-infected individuals diagnosed, 90% diagnosed being treated, and 90% treated achieving viral suppression set by UNAIDS [53]. The resurgence of TB and drug-resistant tuberculosis (DRTP), the persistence of dengue fever, and the new challenges in chikungunya, ebola, and zika, severe acute respiratory syndrome (SARS), and Methicillin-resistant *Staphylococcus aureus* (MRSA) underscore the need for every country to have core public health functionality to identify a threat when it emerges, stop it promptly, and prevent it wherever possible. This requires highly trained and skilled public health professionals in epidemiology, laboratory sciences, logistics, disease surveillance systems, and rapid response teams with an enabling technological environment. In addition the strengthening of the global response capacity, establishing best practices and supporting research and development will also be needed.

# Healthcare and Cultural Disparities

Joseph Sarcone
U.S. Department of Health and Human Services, Agency for Toxic Substances and Disease Registry, Anchorage, AK, USA

## Synonyms

Cultural determinants of health; Healthcare disparities; Health equity

Bias, in the context of prejudice for or against individuals or groups, is inherent in human choice and action. Systemic bias based on race, ethnicity, and culture creates inequality among peoples. This inequality can lead to disparities within a community in the availability and quality of education, public safety, healthcare, and services in other sectors. Cultural disparities in healthcare affect not only health but also quality of life; however, they can be resolved.

The purpose of healthcare is to maintain or improve health through diagnosing, treating, and preventing disease, illness, injury, and other physical and mental impairments in people. Cultural disparities in healthcare can create a pattern of inequality in maintaining or restoring the health of a sector of the population. In healthcare, cultural disparities result from overlapping deficiencies in cultural competency, social equality, the structure and function of communities of care, and the social conditions that influence well-being (Napier et al. 2014).

Health disparity generally refers to differences in the burden of illness, injury, disability, or mortality experienced by one population group relative to another group. Healthcare disparity refers

to differences among groups in health coverage, access to care, use of care, and quality of care. Health equity means providing all people what they need to be healthy and to optimize their quality of life. Access to comprehensive, quality healthcare is important for achieving health equity or fairness in the administration and delivery of healthcare.

## Disparities in Healthcare: The Role of Race, Ethnicity, and Socioeconomic Status

Healthcare disparities emerge from a complex set of contributing factors, including culture, race, ethnicity, sex, gender identity, age, disability, socioeconomic status, and geographic location (CDC 2016). Race sorts people into groups based on sets of physical characteristics. Ethnicity sorts people into groups whose members identify with each other based on a real or presumed common ancestry and culture.

Significant racial and ethnic disparities in healthcare can occur even when patients have similar insurance, comparable preferences or needs for treatment, and the ability to pay for care (IOM 2002). Healthcare disparities have been linked to higher death rates among racial and ethnic minorities (Stith and Nelson 2002). For example, compared to non-Hispanic white Americans, African-Americans are 40% more likely to die of stroke, 30% more likely to die of heart disease, two times as likely to die of cervical cancer, two times as likely to die from prostate cancer, and two and a half times as likely to die during pregnancy (Families USA 2014).

Health disparities are systematically linked with social disadvantage (Braveman et al. 2011), and socioeconomic status is a strong determinant of health-related outcomes (Edge 2006). In fact, socioeconomic differences in health outcomes have been widely documented for most health conditions in most countries (Crimner et al. 2004). While the measurement of socioeconomic status in relation to health can be complicated, culture as a determinant of health is even more complex (Pasick 2008).

## Culture as a Crucial Determinant of Health

Culture is the sum of attitudes, customs, and beliefs that distinguishes one group of people from another and is transmitted from one generation to the next through language, material objects, ritual, institutions, and art. Culture has been proposed as a more accurate explanation for differences in health outcomes within a population than race and ethnicity (Pasick 2008). Culturally based health beliefs explain what causes illness, how illness can be cured or treated, who will be involved in care and treatment, and when they will be involved. *The Lancet* Commission on Culture and Health claims that, "the systematic neglect of culture in health is the single biggest barrier to advancing the highest attainable standard of health" (Napier et al. 2014).

## A Structure for Culturally Competent Healthcare

Cultural competence is defined as the ability to understand, appreciate, and interact with persons from cultures and/or with belief systems other than one's own. Father Michael Oleksa, who has taught courses in cross-cultural communication for 35 years in the University of Alaska system, has said that communication across cultures is approximate and imperfect and that when miscommunication occurs, the non-dominant culture is always the one that suffers the consequences (Oleska 2014). To reduce cross-cultural miscommunication, cultural competence in healthcare requires acknowledging both the patient's and the healthcare provider's explanations and perceptions of illness and well-being.

Seminal work by Kleinman and associates (1978) proposes a structure for a culturally competent practice. A healthcare provider practicing in a cross-cultural setting must elicit the patients' view of their symptoms or illness (called an explanatory model). In this model, patients describe their illness in terms of their beliefs, personal or societal attitudes, expectations of the healthcare provider or treatment, and personal therapeutic goals. Identifying discrepancies

between the patient's model and the healthcare provider's model enables the clinician to identify problems for clinical management. Such comparisons help the healthcare provider give a clearer or more appropriate explanation of care to patients and families. More specifically, healthcare providers learn to recognize that conflicts can be based on different values and interests – not differing levels of knowledge. Part of the clinical process involves negotiations between the patient's and the healthcare provider's explanatory models.

Eliciting the patient's model of illness through a set of targeted questions is an important tool for facilitating cross-cultural communication. To ensure patient understanding and identify areas of conflict that need to be negotiated, the wording and number of questions used in the explanatory model approach vary. Depending on the characteristics of the patient, the problem, and the setting, a series of questions might include the following:

What do you think caused your problem?
Why do you think it started when it did?
What do you think your sickness does to you?
How severe do you think your sickness is? Will it have a short or long course?
What kind of treatment do you think you should receive?
What are the most important results you hope to receive from this treatment?
What are the chief problems your sickness has caused for you?
What do you fear most about your sickness?
(Adapted from Kleinman et al. 1978.

Cultural competency extends beyond the healthcare provider and into the institution administering and delivering healthcare services. Culturally competent healthcare systems include programs to recruit and retain staff who reflect the cultural diversity of the community served, interpreter services or bilingual providers for patients who do not speak the same language as the provider, a policy of cultural competency training for healthcare providers, linguistically and culturally appropriate health education materials, and delivery of services in culturally adapted healthcare settings (Anderson et al. 2003). Enhancing competency not only improves practices but also creates a more responsive and responsible clinical culture (Napier et al. 2014).

## Social Inequality: Reversing a Driver of Cultural Disparities

Equality aims to ensure that everyone receives the same treatment in order to enjoy full, healthy lives. However, social inequality is found in almost every society, demonstrated by unequal opportunities and rewards for different social positions or statuses within a group or society. It is shaped by a range of societal structural factors (e.g., family, education, religion) and supported by conversations about culture and identity that define, for example, whether members of a demographic group, such as the poor, are "deserving" or "undeserving" (Walker 2014). An adverse consequence of social inequality occurs when a people's culture limits their opportunity to become healthier.

The persistent inequalities in the health status of indigenous people are an important example. The 2014 World Conference on Indigenous Peoples reports that of all the barriers to health faced by indigenous people, the cultural barriers present the most complicated challenge (United Nations 2014a).

Social inequality in the healthcare of indigenous people is further influenced by inequities in the determinants of health (King et al. 2009). For example, extreme poverty is a social determinant of health that is significantly more prevalent among indigenous peoples than nonindigenous groups (United Nations 2014a). Other determinants include a lack of access to education and social services, destruction of indigenous economies and sociopolitical structures, forced displacement, armed conflict, and the loss and degradation of their customary lands and resources.

These forces are determined and compounded by structural racism and discrimination. Because

of these factors, indigenous peoples suffer from high levels of malnutrition, cardiovascular illnesses, HIV/AIDS, and other infectious diseases such as malaria and tuberculosis (United Nations 2014b). Indigenous women and children are particularly vulnerable to poor health, resulting in greater maternal and infant mortality.

Healthcare that encourages recognition, respect, and understanding of the social and cultural differences between peoples, as well as differences in their knowledge and resources, is necessary to achieve health equity. Comprehensive and relevant health strategies can actively include groups that have unequal opportunities to help them get quality healthcare and maintain good health (United Nations 2014b).

## Integrated Communities of Care and Overcoming Cultural Disparities

A community of care is defined by the collection of health activities that occur within a certain group, both clinical and sociocultural. The success of communities of care depends on a complex set of factors and hinges on addressing the difference between the rational knowledge of healthcare systems and patients' culturally influenced beliefs. The manner in which cultural disparities relate to the structure and function of communities of care can be observed in the medicalization of clinical care and the practice of evidence-based medicine (EBM).

Medicalization is the process by which conditions and problems come to be defined and treated as medical disorders or illnesses. Once defined, they become the subject of medical study, diagnosis, prevention, or treatment. Medicalization can be driven by new evidence or hypotheses about conditions, by changing social attitudes or economic considerations, or by the development of new medications or treatments (Newman 2011).

In medicalization, professionals and corporations play a powerful role. This process has an impact on ordinary people whose self-identity and life decisions may depend on the prevailing medical concepts of health and illness (Newman 2011). Once a condition is classified as "medical," care that addresses the broader social determinants of health tends to diminish as does the formation of integrated communities of care.

Evidence-based medicine (EBM) is an approach to medical practice that optimizes decision-making by using evidence from well-designed and well-conducted research. Although all biomedical science-based medicine has some degree of empirical support, EBM goes farther in classifying evidence by the strength of research methods, validity, and scope and bases strong recommendations on only the strongest types of evidence. As the concepts of EBM have evolved, the limitations of early models have become more apparent. Newer models for evidence-based clinical decision-making consider the patient's circumstances and preferences, as well as the best research evidence. In this approach, clinical expertise plays a central role in integrating these components (Newman 2011).

EBM has evolved to include an acknowledgment that clinical care alone does not sustain health and that health is best served by clinical care embedded in relationships of social and cultural meaning (Napier et al. 2014). Integrated communities of care function best when the diverse needs of multicultural groups are addressed in the biomedical setting. Here communities of care are not just defined by medical condition and place but by community consensus about cultural beliefs and attitudes toward health and healthcare.

## Social Conditions that Overcome Disparity and Influence Well-Being

The social conditions in which human beings develop and function influence their behavior, which in turn influences their health. The presence or absence of a general sense of well-being in any given cultural group can affect health, as can the presence or absence of social trust – a belief in the honesty, integrity, and reliability of others (Pew Research Center 2007).

Health is built upon person-to-person interaction. Clinical social engagement that allows time

to develop trust is key to both effective clinical care and to accurate diagnoses (Napier et al. 2014). Creating a culture that supports the formation of meaningful relationships of trust between practitioner and patient promotes health and well-being (Napier et al. 2014).

*The Lancet* Commission on Culture and Health (Napier et al. 2014) states that a healthy and happy patient is also a more trusting citizen who develops multiple binding contracts with others over time, for example, trusting social service institutions to meet their needs when necessary. Such patients are invariably more tolerant, more understanding, and more willing to accept the consequences of personal choices (Napier et al. 2014).

The Commission goes on to say that interpersonal trust is the central cultural value that enhances well-being and life satisfaction (Napier et al. 2014). Trust is measured in a society's ability to accommodate cultural diversity. Trust not only provides a measure of perceived wellness but also of where, when, and how diverse individuals build or fail to build strong relationships with health practitioners and with each other in the spaces where they live and work (Napier et al. 2014).

## Conclusions

Factors that contribute to healthcare disparities worldwide include culture, race, ethnicity, sex, gender identity, age, disability, socioeconomic status, and geographic location. A people's culture not only defines health but is also a crucial determinant of health that is distinct from race and ethnicity. Cultural disparities in healthcare happen within a mix of influences, including cultural incompetency, social inequality, the structure and function of communities of care, and the social conditions that undermine or enhance well-being. Cultural competency in healthcare addresses perceptions of illness and well-being so that caregivers and patients are able to negotiate attainable health goals. Social inequality in healthcare can be transformed into social equality when healthcare providers and systems adopt inclusive health strategies. Collective health activities succeed when communities of care form around clinical care embedded in relationships of social and cultural meaning that build trust. Overcoming cultural disparities in healthcare means confronting systemic bias in society to make health equally accessible to all.

# Healthcare Ethics

Patricia M. Alt
Towson University, Towson, MD, USA

## Synonyms

Bioethics; Ethical codes; Professional ethics

## Definition

Healthcare ethics covers a wide range of major principles and philosophies examining the availability and provision of appropriate health care by professionals, caregivers, researchers, and institutions while taking into consideration the preferences of patients/research subjects.

## Introduction

Going back at least as far as Hippocrates, there has been an effort to ensure that the provision of health care is conducted with the best interests of the patient at the center. Initially, paternalism called for practitioners to decide what was best for patients, based on their medical knowledge. Over time, this has evolved to include an array of philosophical and cultural approaches, and many legal requirements, as well. This entry will summarize the most common categories of ethical theories, examine the major principles which emerge from them, and their impact on the delivery of health care. In the process, key areas of interest are patient consent and privacy, licensure requirements for practitioners, regulatory and financial pressures, and organizational ethics regulation. Concerns about healthcare ethics range throughout the lifespan, from genetics and reproductive areas, through an array of treatment choices, to end-of-life care.

## Basic Categories of Healthcare Ethics Theories

There is general agreement that the healthcare system's primary duty is to provide good patient care and protect patients from harm. The field of ethics overall includes personal moral standards based on culture, religion, family, and society, as well as professional and legal categories by which appropriately ethical behavior is measured. Healthcare ethics is the area specifically related to the practice of medicine, including patients, caregivers, healthcare professionals, administrators, researchers, and the general public. Bioethics is a type of applied healthcare ethics focused primarily on ethical choices stemming from advances in medical care and research.

While some authors may use slightly different terminology, the primary categories of ethical theories used in health care are:

1. Utilitarianism or Teleology, coming from the Greek word "telos" for "end or result." In this approach, the right or wrong of an act depends

H

on how much happiness it creates compared to another choice. "The end justifies the means" says that the rightness or wrongness of an act depends on how much happiness it creates compared to another choice. It is most commonly linked with John Stuart Mill and includes: (a) act utility – each decision one at a time, and (b) rule utility – patterns of decisions with a cost/benefit balance over all of them.

2. Duty-based ethics or Deontology, coming from the Greek word "deon" for "duty." In this approach, there is an independent right and wrong which leads to a duty to one's fellow humans. One must treat people as the end of actions, not just as means to your success. Good will and a sense of duty are the key. It is usually linked with Kant. The golden rule of "do unto others as you would have them do unto you" is central to this approach.
3. Virtue-based ethics is based on the view that a rational man can discern what is good and evil, and will choose to do good, in the pursuit of happiness. A series of philosophers from Aristotle to Aquinas described this view, but there is concern about being too trusting that others will always produce good results.
4. Justice-based ethics or Social Contract theory is based on John Rawls' theory that rational people would always choose to do good but that we have a "veil of ignorance" and cannot always know exactly what the good is. Therefore we should always protect the least well off, since we could be in that position ourselves.
5. Rights-based ethics is based on the belief that all people have individual rights, purely because of being human, and that there is a collective responsibility to protect them. It is central to many aspects of American democracy, such as freedom of speech. In health care, it can include equal access to protections (such as under the Occupational Safety and Health Act), but it can be difficult in situations with limited resources (Fremgen 2016).

## Major Principles in Theoretical Reasoning

When examining ethical concerns for health care over all, there are four major principles which emerge. They include respect for persons, beneficence, nonmaleficence, and justice.

1. Respect for persons is a key principle in health law and ethics. It encompasses four subcategories, each of which is also crucial:
   (a) Autonomy – Individuals should be able to govern themselves as much as possible. This has an innate tension with paternalism in medical care and in public health attempts to get us to behave in healthier ways. How much right does one have to make bad decisions?
   (b) Truth-telling – Healthcare providers are expected not to lie to their patients.
   (c) Confidentiality – People expect some right to privacy, but how does that fit with having accurate medical records, for example, as information is shared electronically?
   (d) Fidelity – This centers on keeping promises to provide proper care. This can be important in contract law as well as in licensure of practitioners.
2. Beneficence focuses on always acting with charity and kindness. It includes providing benefits while seeking to balance benefits with any potential harm from health care.
3. Nonmaleficence has the same root word as "malevolent" or "malicious." It centers on avoiding harm, both for patients and staff. Some questions it raises might be whether a bruise from a transfusion is acceptable versus getting a blood-borne disease due to a lack of proper screening.
4. Justice – This category varies according to the philosophy being applied. . .but is a principle of fairness and equity. How do we allocate supplies and services in an equitable manner? For instance, how are potential organ recipients ranked?

## Ways in Which Ethical Approaches Affect Healthcare Delivery

The provision of ethical health care is strongly affected by the internal and external regulation of organizations and professionals, the protection of patients' rights, and financial support (or the lack thereof) for care.

### Codes of Ethics

Codes of ethics, for example, have long existed for doctors, based on standards including respect, honesty, integrity, fairness, compassion, and loyalty. They have also been created for other health professions and for researchers, with varying, but increasing, levels of legal enforcement over time. Key areas included in these codes, and in laws aimed at enforcing them, are the practitioner's obligation: to provide the patient with clear and truthful information; to avoid conflicts of interest, including financial incentives to provide unneeded care; and to keep his/her training and licensure up to date.

### Patients' Rights

Patients' Bills of Rights are another effort to ensure ethical care (and to protect both the patient and the organization providing the care). In one form or another, patients' privacy rights have been in existence for over a century, but more recently they have been more firmly codified under laws including the Health Insurance Portability and Accountability Act (HIPAA) of 1996. The growing emphasis on electronic health/medical records, providing easier access to patient information when necessary, has also raised many ethical questions and privacy concerns.

Security issues are in the forefront in implementing these systems, while laws about them vary from state to state, raising potential ethical dilemmas when patients travel, for example. The Health Information Technology for Economic and Clinical Health (HITECH) Act of 2009 includes measures to modernize the use of technology for private health information but also requires that patients be informed of their privacy rights, including being informed about when and how their information is being used.

### Appropriate Care Provision

There are multiple legal structures to enforce ethical behavior by care providers, all of them aimed at the primary goals of promoting professional competence and reducing paternalism. State licensure laws require particular levels of training and ongoing maintenance of competence for practitioners. They also require proper attention to the needs of the patients and the maintenance of appropriate confidentiality in their care.

Other laws, such as the Federal Emergency Medical Treatment and Active Labor Act (EMTALA), enacted in 1985, prohibit hospitals from "dumping" patients in emergency situations, whether they have insurance or not. This is called the "duty to treat." The "duty to not abandon" patients includes the responsibility to not terminate their care improperly without adequate referral and formal notification.

Another evolving area of ethical concern is the expansion of access to quality care while balancing it with improving efficiency in care delivery. There is no universal right to care in the United States, and healthcare administrators have both a fiduciary duty to keep their organization afloat and an ethical responsibility to the patients they serve. With the wide variation among states in the implementation of the Affordable Care Act, access to insurance (public or private) is far from guaranteed.

Similarly, developing and maintaining a steady supply of well-trained and ethical clinicians is critical to ongoing care provision. There is concern about the growing need for clinicians as the population grows older, and the likelihood of their experiencing challenges to their integrity, leading to burn out.

Providers do have ethical obligations (and legal protections) for "whistle-blowing" when they observe improper care being given by others and report it. The fear of lawsuits, however, can have a negative "defensive medicine" effect by creating pressure on providers to provide unnecessary and costly care. Balancing out the best interests of the patient, the practitioner, and the organization can be ethically challenging when

there are obligations both to provide appropriate care and to contain costs.

### Organizational Review Committees

In healthcare settings, there are three categories of review committees, including ethics committees, institutional review boards (IRBs), and infant care review committees. Of course, they only exist where appropriate, but most healthcare organizations now have at least an ethics committee structure to discuss tricky cases and to advise families and staff in difficult decisions.

(a) Hospitals are now required by the Joint Commission on Accreditation of Healthcare Organizations to have ethics committees. These committees include a variety of members from many healthcare fields, as well as lawyers, ethicists, administrators, and community representatives. They meet to advise the practitioners, families, and facilities about their options when faced with complicated situations.
(b) Institutional Review Boards (IRBs) for the protection of human research participants are set up to protect patients who are in research protocols. All facilities which receive federal research funds are required to have them. These boards meet to review proposed and continuing research projects, evaluating the balance between potential benefits and risks for the patients/subjects involved and potentially valuable improvements in overall medical knowledge. Ensuring proper informed consent procedures is a critical aspect of these reviews.
(c) Infant care review committees are aimed at protecting vulnerable patients from mistakes by the organization or its practitioners. They only exist in facilities with neonatal/pediatric programs.

## Ethical Issues in Health Care Through the Life Span

### Beginning of Life Care

There are numerous ethical issues which arise around care at the beginning of life, and they are only increasing as the combination of politics, media, and research continues to focus on them. This is an area where personal values often conflict, and the healthcare system needs to be particularly sensitive to their role in patient-provider interactions. One key area is the issue of when life actually begins, and it shapes multiple ethical and legal conflicts. A few of them include: genetic testing and counseling, assisted reproduction, sterilization, contraception, and abortion. Brief overall descriptions of these topics follow, but the ethical dilemmas in a given situation will vary depending on the individuals and organizations involved.

(a) Genetic testing and counseling – As our knowledge of the human genome has expanded, it is now possible to evaluate individuals' likelihood of passing on a defective gene to their offspring. If this is done before pregnancy, potential parents can make informed decisions about whether to conceive or not. If done during pregnancy, choices about pregnancy termination or preparation for dealing with potential genetic defects can arise.
(b) Assisted reproduction – Various methods of artificial or assisted reproduction exist, including artificial insemination. Legal concerns can arise, particularly about the legitimacy of the offspring and the connection (if any) to the sperm donor. Ethical considerations often center around proper maintenance of private records.

    In another type of assisted reproduction, in vitro fertilization (IVF), the ovum and sperm cells are combined in a lab outside the woman's body. One big concern in this setting is the status of multiple fertilized eggs, which are often frozen and saved for future attempts, used for research, or eventually destroyed. Another concern is with the use of "surrogate mothers" who agree to bear a child for the legal parents. This can lead to legal and ethical struggles over the rights of all concerned in choosing to continue the pregnancy and/or to claim or refuse to claim the offspring.
(c) Contraception – Although the Catholic Church does not approve of contraception, it is legal in most countries and in all American states for adults. In most ethical discussions

other than religious ones, however, the key area which is discussed is involuntary sterilization, including for criminals or the cognitively impaired. Does the society as a whole have an obligation to deter reproduction when the offspring will be a burden to the nation?

(d) Abortion – Abortion is the termination of a pregnancy before the fetus is viable. The laws and ethical beliefs about it have varied over time. In the United States, a key Supreme Court case was *Roe v. Wade*, in 1973. This case decided that a Texas law prohibiting abortions not necessary to save the mother's life was a violation of a woman's right to privacy under the 14th Amendment. In the decision, the Supreme Court adopted a process linked to the trimesters of the pregnancy and the viability of the fetus. It proclaimed abortions prior to viability to be a decision between the woman and her physician, but after viability the state would have a compelling interest in saving the life of the child, unless to do so would harm the life or health of the mother. There have been a steady flow of cases ever since, clarifying women's rights, but also wrestling with such issues as "partial birth abortions" in which relatively late-term pregnancies are ended by inducing delivery and aborting the fetus on the way out. Another area of controversy is the "Plan B" contraceptive pill which can prevent implantation of a fertilized egg if taken within 72 hours of intercourse. To many opponents, this is seen as a form of abortion, but (for instance) others see it as a particularly valid response to rape situations. There are also a multitude of laws about employees' rights to refuse to participate in abortions, as well as strict rules about using public funds to pay for them. These are strongly tied to the ethical beliefs of the lawmakers, as well as trying to uphold the ability of practitioners to abide by their consciences when making medical decisions.

### Care Throughout the Life Span

As medicine advances, and new research appears, new ethical dilemmas are constantly arising. Some areas of concern which are not solely focused on beginning or end of life care are organ/tissue donations and transplants, genetic engineering (including stem cell research), and the therapeutic use of medical research, particularly in crisis situations.

(a) Organ/tissue donations and transplants – In the United States, individuals may voluntarily donate organs or tissues and indicate their willingness to do so in advance directives or on their driver's license. Since 1999, there has been a nationwide database, the United Network for Organ Sharing (UNOS), covering all donations and transplants since 1986. It is responsible for allocation of organs, using a formula based on considerations of medical need and considerations of justice. However, given a substantial shortage of organs, individuals have resorted to various methods to obtain them, including the internet, and "medical tourism" in which they travel to another country and pay to acquire one. Ethically, this is considered totally wrong, but the complicated process of rising on the list of potential recipients can also be ethically questionable.

(b) Genetic engineering and stem cell research – While the field of genetic engineering is still evolving, there have been some useful therapies developed, and great hope remains for future results, particularly from stem cell research. There is ethical concern that gene therapy might be used for some unnecessary reasons (to make a person taller, perhaps) but also hope that genetic diseases might be corrected. Stem cell research has been an area of interest since the 1990s, raising ethical questions about the sources of the stem cells, particularly when they are embryonic. Most recently, there have been attempts to combine human induced pluripotent stem cells (iPS) with those of animals in order to advance research and potentially to grow needed human organs in the bodies of animals.

(c) Medical research – As stated above, the federal government requires all institutions receiving federal research funds to establish institutional review boards (IRBs) to oversee human research. A central aspect of the IRB's role is to ensure that participants in therapeutic research are given the opportunity to consent,

based on full information about the project. In some emergency situations, research can go on without consent, but only if absolutely necessary. In addition, the protection of private information is central to the review process, ensuring that individuals are not publicly harmed by participating.

## End-of-Life Care

Another area of central importance in healthcare ethics is care at the end of life. While death is inevitable, the ability of medical intervention to sustain existence has raised multiple ethical questions, particularly about the need to preserve the patients' dignity and abide by their choices. In addition, the legal definition of death has become more complicated due to the variety of treatments available. One example is the case of Karen Ann Quinlan, whose family won a case allowing the removal of her respirator in 1976, although she remained in her permanently comatose state for another 10 years before dying. Similarly, Nancy Cruzan was in a vegetative state for 8 years, while her family fought the legal battle to allow the removal of her feeding tube, winning their battle in 1990.

Another well-known case is that of Terri Schiavo, whose family members fought for years in court over the proper decision after she had been in a vegetative state for 15 years. In the Schiavo case, the Florida governor and legislature also became involved, leading to repeated insertions and removals of her feeding tube before she finally died in 2005. These cases, and many others, highlight the conflicts between perceptions of the right to refuse treatment and to have a natural death, and the sense of obligation among families, practitioners, and institutions to maintain life at all costs. Some key ethical areas include the use of advance directives, the treatment of the terminally ill, and the right to physician assistance in dying.

(a) Advance Directives – Often known as living wills, these documents record individuals' preferences for care should they become incompetent and have a poor prognosis. After the Federal Self-Determination Act of 1991, all healthcare facilities which receive funding from Medicare or Medicaid must ask patients on admission whether they have advance directives or wish to have information about them. These documents can include do not resuscitate orders, durable powers of attorney for health care, or their state's equivalent of the Physician's Orders for Life-Sustaining Treatment (POLST) form. If a patient has not documented his/her wishes, the "substituted judgment rule" is applied, in which a person, committee, or institution will try to determine what the patient would have wanted. Most often, lacking an advance directive, the patient will be given all possible interventions in order to protect the medical organization from lawsuits.

(b) Treatment of the terminally ill – Considerable thought has been given to ethical questions about the quality of life in persons with terminal illness. This can be tied into decisions about types and levels of treatment, medications, preserving mental health, etc. Pain treatment, in particular, is a topic of much controversy, with reluctance to overprescribe medications and potentially create addiction being balanced against wanting to control suffering at the end of life. One area in which a great deal of effort has been placed is in hospice and palliative care. It is meant to allow patients to live comfortably when their disease is no longer able to be cured. However, there is some concern that with Medicare coverage for hospice available since 1983, some patients might be inappropriately placed in hospice care, particularly when it is provided by for-profit organizations. Under the Affordable Care Act, the Centers for Medicare and Medicaid Services have expanded their oversight of Medicare-funded hospice programs to ensure that proper care is being provided.

(c) Physician assistance in dying – While active euthanasia, or the intentional killing of the terminally ill, is illegal and generally considered unethical in the United States, it is permitted in some other countries under strict guidelines. The closest equivalent in the

United States is generally referred to as physician-assisted suicide, in which the doctor provides the terminally ill patient with a prescription for a lethal dose of medication. It is up to the patient to have the prescription filled and to self-administer it. A few states (Oregon, Washington, Vermont, Montana) have passed laws allowing this procedure, under strict guidance. However, no practitioner is compelled to participate in it if it goes against his/her beliefs. The question is being explored in other states' legislatures, as well.

## Conclusion

While ethical issues will always arise in the provision of healthcare services, there is considerable attention being paid at this point to clarifying the need for patient autonomy and informed consent at all levels of care. In addition, practitioners and health organizations are being monitored by federal and state agencies to ensure that they are abiding by rules connected with public funding under Medicare, Medicaid, and the Affordable Care Act. The Affordable Care Act includes some provisions allowing states to regulate what services will be covered by insurance coming through their health exchanges. However, it also requires that services not be denied due to preexisting conditions and explicitly leaves medical decisions in the hands of patients and their doctors. Lawsuits continue over how and whether organizations sponsored by religious groups are required to offer birth control coverage for their employees, although states do have the right to prohibit abortion coverage through these plans.

The regulation of care through public laws, professional codes of ethics, and ongoing support for individual patients' rights does provide a framework for the discussion of key issues in health care. Given the varied perspectives individuals have on what is ethical in any given circumstance, there will need to be some latitude about care provision. However, monitoring will always be required to ensure that conflicting interests do not endanger the maintenance of competent care and the validity of ongoing research efforts to provide better options.

# Health-Care Policy in America

Ke Chen
Department of Political Science, International Affairs and Public Administration, East Tennessee State University, Johnson City, TN, USA

## Synonyms

Health policy

## Definition

Health-care policy refers to the decisions, plans, and actions that are undertaken by a government to achieve specific health-care goals within a society.

## Introduction

The health-care system in the USA is facing great challenges of increasing expense and decreasing affordability. In the year 2014, it spent 17.1% of gross domestic product (GDP) on health services, leading all other nations (World Bank 2016). In comparison, its northern neighbor, Canada, spent only 10.5%, and countries in the European Union (EU) spent 10.0%. Per capita health expenditure in the USA is $9402, far exceeding $5291 in Canada and $3612 in EU countries (World Bank 2016).

Yet, despite greater spending on health care, the USA does not perform better than other developed countries in health outcomes. Of 17 high-income countries studied by the National Institutes of Health (NIH) in 2013, it does not fare well compared to other developed countries on indicators such as infant mortality, heart and lung disease, sexually transmitted infections, average lifespan, etc. Also, the USA does not compare favorably on health-care resources, including doctor and hospital capacities. For instance, in 2009, the USA had 2.4 doctors per 1000 residents, compared to 3.6 in Germany, 3.3 in France, and 2.7 in the UK (OECD 2016).

Therefore, the US health-care system is often described as inefficient and wasteful (McClellan and Rivlin 2014). Although multiple factors such as high drug cost, high physician cost, and high obesity rate contribute to the expensive and ineffective system in the USA, few can deny that health-care policy plays an important role in influencing or regulating the health-care system and the resulting health-care cost and outcome.

In this article, we first examine the health-care policies in the developed countries. We continue to discuss the historical development of health policies in the USA, including Medicare and Medicaid and more recent Affordable Care Act. Then we move on to discuss the challenges and problems that the US health-care market faces. Finally, we make a brief conclusion and explore the future direction for health-care policies.

## Health-Care Policies: International Experiences and National History

### International Experiences

It has been over a century since Germany started the first social insurance law on health in 1883. Some neighboring countries, including Austria, Hungary, Norway, Britain, Russia, and the Netherlands, followed the German path after seeing the benefits of initiating a compulsory insurance on the protection of the working class against wage loss due to sickness (PNHP 1999).

After the end of World War II, universal health-care systems began to be set up around the world. The UK launched its universal National Health Service in 1948 amid a broad consensus that health care should be made available to all. Under the universal health-care system, all legal residents have free access to most health-care services, which are funded through taxes and overseen by the government. In the following years, various forms of universal access to medical services were gradually established by most developed countries to cover all population, except in the USA (OECD 2016).

Among the countries that provide universal health care, there is a significant difference on government roles, financing sources, and delivery methods (Patel and Rushefsky 2014). Some countries have a health-care system that is mostly public, where health care is paid through taxation and is provided by publicly owned hospitals. Countries like Great Britain, Sweden, and Italy use such a model (Patel and Rushefsky 2014). Some countries adopt a hybrid model that combines both public financing and private markets. In such a system, health care is mostly public financed through taxes but is delivered by private hospitals and doctors. Germany, Japan, Canada, and France take this path (Patel and Rushefsky 2014).

### USA: Pre-social Insurance Era

While universal health care was well recognized and gradually established in all other developed countries, the twentieth-century USA evolved from a society without compulsory health insurance to a market with a partially functional private health-care system.

At the early twentieth century, health insurance was extremely rare and most Americans paid for health care on a fee-for-service basis. With the advancement of medical technology, health care and particularly hospital service became more expensive and gradually unaffordable to the poor. As a result, some political parties tried to help citizens gain more access to quality care with affordable cost. Early efforts include 1912 Teddy Roosevelt's Bull Moose presidential campaign for National Health Service and 1915 Progressive's push for more specific health insurance programs in state legislatures (PNHP 1999).

In the 1930s, a third-party system started with the establishment of the Blue Cross and Blue Shield (BCBS) insurance plans, which transformed health-care financing and led to employer-based health insurance programs (Patel and Rushefsky 2014). With the intention of providing affordable health care in the nonprofit context, BCBS plans expanded patients' coverage to hospital networks across the country, thus filling significant holes in the health-care system (Consumer Union 2013).

After WWII, President Truman called for a universal and compulsory health insurance and health-care system with federal funding (Jacobs and Skocpol 2015). However, earlier efforts to nationalize health care were opposed by various groups, such as the American Medical Association and private insurance companies for fear of communism (Jacobs and Skocpol 2015). Meanwhile, medical expenses kept increasing and private insurance remained unaffordable or simply unavailable to many, particularly the poor, the unemployed, and the elderly.

In 1950, the first federal program was established to provide federal matching funds for state payments to medical providers on behalf of individuals receiving public assistance payments. In 1960, the Kerr-Mills Act created a new program called "Medical Assistance for the Aged." This means-tested grant program provided federal funds to states that chose to cover the "medically needy" who were defined as elderly individuals with incomes above levels needed to qualify for public assistance but in need of assistance for medical expenses (US Department of Health and Human Services 2000).

## Medicare and Medicaid

In the mid-1960s, it was found that only about half of all elderly persons had health insurance, and many of private policies were not comprehensive but very expensive. Clearly, the private health insurance market was not working for elderly Americans (National Academy of Social Insurance 1999). Consequently, interest persisted in creating public health insurance for those left out of the private marketplace. Finally, President Lyndon B. Johnson signed the Medicare and Medicaid programs into law in 1965, creating publicly run insurance for the vulnerable groups of the poor, disabled, elderly, veterans, and children.

Medicare is administered by the federal government and supported by mandatory contributions from workers and employers and payments from program beneficiaries as well as general tax revenues (National Academy of Social Insurance 1999). US residents who or whose spouses are at least 65 years old with at least 40 quarters of coverage through employment are eligible for Medicare. Since inception in 1965, the number of individuals enrolled in Medicare has doubled from 19.5 million persons in 1967 to 38.6 million in 1997 (National Academy of Social Insurance 1999).

In comparison, Medicaid serves as the nation's primary source of health insurance coverage for low-income populations. Under the program, the federal government provides matching funds to states, offering medical assistance to eligible residents whose incomes are insufficient to meet the costs of necessary medical services. Overseen by the federal Centers for Medicare and Medicaid Services, each state administers its own Medicaid program, establishes eligibility standards, determines the scope and types of services it will cover, and sets the rate of payment (Hoffman et al. 2000). Since 1965, Medicaid enrollment and expenditures have grown substantially. According to the US Department of Health and Human Services in 2000, Medicaid enrollees numbered 39.9 million Americans, the largest group being children.

Despite these social insurance and protection programs, problems remained at the end of the twentieth century. First, there were a large number

of individuals who did not have any private health insurance and were not qualified for public insurance programs. In 2008, 66.7% of Americans were covered by private insurance, 14.3% by Medicare, and 14.1% by Medicaid, but around 15.4% of American people did not have any health insurance (Census 2009). People with no health-care insurance receive less preventive care and early treatment. Therefore they are more likely to develop disease at advanced stages and thus end up using hospital emergency care. This results in worse health outcome for uninsured individuals, inefficient use of emergency rooms, and higher financial cost for hospitals that are required by law to provide emergency care to the uninsured without any federal funds (Jacobs and Skocpol 2015).

Second, despite Medicare coverage, elderly people face considerable financial risk from health-care expenses at the end of life (Kelley et al. 2013). It was estimated that on average, out-of-pocket health-care costs for elderly Medicare beneficiaries accounted for about 19% of annual household income (National Academy of Social Insurance 1999) and about 43% of senior citizens' medical spending surpassed their non-housing assets due to out-of-pocket expenditure in the last 5 years prior to their death (Kelley et al. 2013).

### Affordable Care Act

By the early twenty-first century, the USA was the only industrialized economy that did not provide universal health care to its citizens, while spending more on health care but not achieving better health outcome among citizens. To address this issue, after a long and controversial political and legislative process, the Patient Protection and Affordable Care Act (ACA) became law in 2010. ACA provides for major changes in health insurance in the USA after Medicare and Medicaid was passed in 1965.

One essential aspect of ACA is that it requires all individuals not covered by an employer sponsored health plan or other public insurance programs to purchase a private-insurance policy or otherwise pay a penalty. ACA also requires businesses with over 50 employees to provide health-care insurance or pay a penalty. In addition, individuals between the ages of 19–25 years are allowed to remain on their parents' health insurance plans. Regarding health insurance providers, ACA prohibits insurers from denying coverage to individuals due to pre-existing conditions but requires insurers to offer the same premium price to all applicants of the same age and geographical location.

The marketplace for the health insurance under ACA with federal subsidy is a system of health-care exchanges, which are established by individual states or the federal government to provide health-care insurance for individuals with limited means or for small businesses. Individual subsidies are provided to those qualified in the state or federal health-care exchanges, extending from 100 to 400% of the federal poverty level. ACA also expands Medicaid to include up to 133% of the federal poverty level, although individual states are given the option not to participate in this expansion.

After years of implementation, the ACA has increased the rate of health-care insurance. In 2014, the insured rate was estimated to be 89%, a 4% increase compared to the year of 2008. Together, 7.3 million people remain enrolled in private coverage through the online marketplaces, 85% of whom qualified for federal subsidies to help pay premiums. For those who are qualified for subsidies through the federal exchange, the subsidies lowered the cost by 76% on average.

However, affordability of health insurance continues to be a concern for many people and disparities persist by geography, race, ethnicity, and income (French et al. 2016). Moreover, middle-income families who don't qualify for subsidies are more likely to have difficulties with premium costs (French et al. 2016). In addition, patients insured through ACA programs have encountered challenges such as narrow networks, increased premiums, and higher out-of-pocket costs (Rosenthal 2016). One of important reasons is that health-care exchanges are losing commercial insurers. As of August 2016, some major insurers such as Aetna, UnitedHealthcare, and Humana are pulling out from health-care exchanges due to huge financial losses (Leonard

2016). Overall, it was estimated that the number of insurers in the health-care exchanges will drop from 298 to 228 or 23.4% from 2016 to 2017 (Luhby 2016). Furthermore, premiums for health-care plans under the ACA are rising an average of 22% in 2017, making health care less affordable for tens of thousands of Americans (Luhby 2016).

## Problems and Challenges

Despite some changes that were brought out by ACA, some fundamental challenges remain in the health-care market in the USA. These challenges include but are not limited to rapidly increasing medical costs, changes in the medical practice, and health problems caused by obesity. The future success of health-care policies may need to address these problems.

### Increasing Medical Cost

Although ACA aims to decrease health-care costs (Fernando 2015; French et al. 2016), national spending on health care continues to rise. In 2016, US health-care spending increased 5.3% in 2014, exceeding growth of 2.9% in the previous year. The faster growth occurred in the public programs, as Medicare spending grew 5.5% and Medicaid spending increased 11.0%. The increased spending in the public programs was largely driven by the newly eligible enrollees under the ACA (Medicare and Medicare Services 2016). The trend is expected to continue. For the 10 years between 2014 and 2024, health spending is projected to grow at an average rate of 5.8% per year, 1.1% higher than the projected GDP growth (CMS 2016). This presents a huge problem to the nation, as other consumption and investments in future economic growth will be sacrificed.

Various factors contribute to increased medical cost (CMS 2014). While higher physician fees and greater use of advanced technology in medicine are important components of high medical costs, the USA also spends much more money in health-care administration when compared to other countries (Woolhandler et al. 2003). It was estimated that in 1999, health administration costs averaged $1059 per capita in the USA, as compared with $307 in Canada. Between 1969 and 1999, the share of the US health-care labor force accounted for by administrative workers grew from 18.2 to 27.3%. In Canada, it grew from 16.0% in 1971 to 19.1% in 1996 (Woolhandler et al. 2003). Around 2010, administrative costs accounted for 25% of hospital spending in the USA, more than twice the proportion seen in Canada and Scotland (Himmelstein et al. 2014).

One important reason for high administrative cost in the USA is multi-payer health-care system. The US system of per-patient billing requires a large team of clerical and management staff and special information technology systems. In addition, billing specialists are needed to determine how to bill to meet the varying requirements of multiple insurers, since each hospital must negotiate payment rates separately with each payer and conform to a variety of requirements and billing procedures. In comparison, countries like Canada that have a single-payer system don't require this level of staffing to administer health care (Himmelstein et al. 2014).

High drug cost is another important contributor to ever increasing medical cost. From 2013 to 2014, hospital care, physical and clinical services, professional service, home health care, and nursing care all experienced cost growth between 2.4 and 5.2%. In contrast, prescription drugs saw the highest cost growth rate of 12.2% during the same period (CMS 2014). It is found that most drugs in the USA are more expensive than similar products in other developed countries (WSJ 2015). Lack of government regulation on pharmaceutical companies is argued to be the major cause of high drug cost (WSJ 2015).

Some scholars also argue that many expensive health-care procedures generate much greater cost than benefit but provide little or no benefit to patients. For example, there may be overemphasis on extending life rather than improving the quality of life (Blackstone and Fuhr 2016). Furthermore, patients' poor adherence to treatment regimens has long been recognized as a substantial barrier to achieving better health outcomes but produces additional medical cost. It is found that as many as half of all patients do not adhere faithfully to their

prescription-medication regimens, and the result is more than $100 billion spent each year on avoidable hospitalizations (Cutler and Everett 2010).

### Changes in Medical Practice

The implementation of the ACA has produced a profound effect on the health-care delivery system in terms of the organization, finances, and clinical aspects of medical practice (Birk 2016). For instance, ACA instituted the Accountable Care Organizations (ACOs), a health-care organization to coordinate care and control costs, since the present health-care system is fragmented, with patients seeing various types of physicians with little communication among the providers. Despite some observed benefits in ACOs, they are also found to encourage mergers and consolidations of insurance companies and health providers, which in turn increases market power and the consequent ability to raise prices for health-care services (Blackstone and Fuhr 2016).

Moreover, there is a trend that for-profit hospitals are becoming major health-care providers. Traditionally, both not-for-profit and for-profit organizations operated hospitals in a cooperative manner. Today, however, the number of nonprofit hospitals has rapidly diminished as corporate entities assume control to reap the clear financial benefits of for-profit hospitals. In 2005, nearly 67% of all US urban hospitals were nonprofit (Horwitz 2005), while 10 years later in 2015, this number dwindled to less than 50% (Birk 2016).

Meanwhile, institutional and large group practices have become increasingly attractive to young physicians, especially those who want to ease burdens of finance, regulation, and retirement benefits (Birk 2016). As a result of declining number of private practice, hospitals exert control over not only inpatient care but also over a significant portion of outpatient care. In that setting, hospitals have absorbed the physician-insurance link. The consolidation trend toward larger institutions controlled by business executives and geared toward generating profit making will continue to grow, resulting less competition and possibly increased health-care cost for patients (Bai and Anderson 2015; Birk 2016).

### Obesity Problem

Eventually, no matter which trend in health spending prevails, the nation would be better off if Americans were healthier and health resources were used more efficiently. However, data show that an increasing percentage of Americans is considered unhealthy due to their body weight and the associated health problems.

In 2012, 35.3% of population aged 15 years and over are obese in the USA, the highest among all OECD countries (OECD 2014). In contrast, the corresponding numbers for Canada, Germany, and Japan are 25.4, 14.7, and 3.6%. From the historical perspective, the obesity rate in the USA has seen significant increase from less than 15% in the 1970s to over 30% after 2000. A similar trend is observed in the childhood obesity rate.

Obesity causes severe health problems such as diabetes, heart disease, stroke, and arthritis, producing a significant economic impact on the US health-care system. Direct medical costs to diagnose and treat diseases related to obesity are estimated at around $147 billion a year in 2015 (CDC 2016). Since people with less education and lower socioeconomic status are more likely to be obese, publicly funded programs such as Medicare and Medicaid are paying half of direct medical costs for people with obesity (Finkelstein et al. 2009).

One major cause of obesity is lack of physical activities. Sedentary lifestyle such as reliance on cars to drive, few physical demands at work due to modern technology and convenience, sitting in front of TV and computers after work, and lack of physical education classes in schools are all reasons of inactivity resulting in obesity (NIH 2012).

Built environment and social environment in the USA don't support healthy lifestyle either. As people are living farther away from work places due to urban sprawl, people don't have time to exercise as much time is spent commuting by cars. In 1980, the average daily commute time was estimated at 21.7 min, and in 2013, the number increased to 25.8 min (PRB 2014). Longer

commutes are associated with less physical activity, lower cardiorespiratory fitness, higher rates of obesity, and elevated blood pressure (PRB 2014).

Lack of recreational space is another reason for inactive lifestyle. Many neighborhoods do not have safe sidewalks or neighborhood parks for exercise (Durand et al. 2011). For economically disadvantaged people in particular, as they may not be able to afford gym membership, limited free space for walking or exercising makes it hard for them to be physically active (NIH 2012).

Oversized food portions and lack of access to healthy food are blamed for the obesity epidemic as well. Americans are exposed to huge food portions. Some people don't live in neighborhoods with supermarkets that sell healthy foods, such as fresh fruits and vegetables. In some circumstances, some people just cannot afford healthy foods (NIH 2012).

Realizing the significance of the obesity problem, some health-care policies have been initiated to prevent obesity from spreading further. Under ACA, several states have expanded coverage in Medicaid and introduced co-payments that can be waived when beneficiaries comply with specific wellness targets (OECD 2014). However, to reverse the obesity epidemic, a more comprehensive and coordinated approach in policy change is required to transform communities into environment that supports and promotes healthy, active lifestyle choices for all.

## Conclusion

While all other industrialized countries adopted universal health-care system after World War II, the USA only started publically funded medical insurance programs in the 1960s but leaving a sizable population uncovered by any health insurance. The Affordable Care Act in the early twenty-first century aimed to provide more affordable health care to people who could not do so otherwise. However, after a few years of implementation, the act needs to further improve health-care service for all people in need and requires more effort in retaining commercial insurers in the government-run health insurance market. Furthermore, it needs to address some fundamental problems in the American health-care system, including rapidly increasing medical costs and the obesity epidemic. Overall, successful future health-care policies should take a more comprehensive approach to decrease health-care cost and improve the health condition of American people.

## Suggestions for Future Research

The Affordable Care Act is going to expire in 2020. If the medical cost keeps accelerating and the health-care exchanges keeps losing participating insurers, the ACA will face challenges to get renewed around the expiration time. Also, how about the large population of undocumented immigrants? How shall they be considered in the health-care market? Essentially, what are feasible public policies to promote more active lifestyle and make American healthier? These are all important and relevant research questions.

# Heritage Assets

Natalia Aversano
Department of Mathematics, Computer Science and Economics, University of Basilicata, Potenza (PZ), Italy

## Synonyms

Artistic assets; Cultural assets; Historical assets

## Definition

In this notion fall the assets that have intrinsic historical, artistic, scientific, technological, geophysical, or environmental qualities (i.e., historic buildings, monuments, archeological sites, nature reserves, protected areas, and works of art).

## Introduction

In the international scene, there is no single definition of heritage assets. The word "heritage" is generically referred to as resulting "from the past," while with the word "asset" refers to goods, activities, or resources. In Italy heritage assets are translated as *beni di interesse storico – culturale*, but, in a wider meaning, this term could also encompass the faunistic heritage, flora, natural places, etc. In France it is called *patrimoine culturel*, in Germany *Kulturerbe*, and in Spain *Patrimonio Cultural*.

Heritage assets are resources with respect to which each country establish a regulatory system designed to protect them, as typical public goods. At the international level, UNESCO (United Nations Educational, Scientific and Cultural Organization) is the organization set up by the United Nations which has the task to identify, protect, and safeguard the cultural and natural heritage around the world in order to pass to the future generations the heritage of the past. The definition of heritage assets is to be found in the Convention concerning the Protection of the World Cultural and Natural Heritage, signed in Paris in 1972, which gives a separate definition to the cultural heritage and natural heritage: *Cultural heritage* is represented by *monuments*, *groups of buildings*, *or historical*, *esthetic*, *archeological*, *scientific*, *ethnological*, *or anthropological sites* (Art. 1); *natural heritage*, however, *can be defined considering their relevant physical*, *biological*, *and geological characteristics*, *as well as the habitat of endangered plant and animal species and areas of special scientific and esthetic value (Art. 2)*.

On the basis of this international treaty, UNESCO has recognized 1031 sites (802 cultural, 197 natural, and 32 mixed present in 161 countries around the world (www.unesco.org).

## The Characteristics of Heritage Assets

Heritage assets present some particular characteristics (Carnegie and Wolnizer 1995): (1) it's very difficult to identify a book value based on market prices that fully reflect their cultural, environmental, educational, or historical value; (2) there are legal or statutory restrictions that prohibit or limit the sale; (3) they are often irreplaceable, and their value may increase over time, even if their physical condition deteriorates; (4) it may be difficult to estimate their useful life, even if it may also be indefinite in some cases.

The most relevant characteristic of heritage assets is that they are held for "social purpose" with the possibility of handing down a particular richness to future generations. Moreover, the heritage assets give visibility to the country holding them, increasing the attractiveness of the country and culture tourism, which will certainly generate treasure for the nation.

Heritage assets primarily have a social, cultural, and historical value, and, for the community, their value is based on their ability to shape the identity, origin, and culture of a country.

Heritage assets are controlled and kept for an indefinite period of time by governments or other public or third sector bodies to make them available for current and future generations, and they must be preserved and maintained in a good state in such a way as to ensure a long and indefinite life (Barton 2005).

Public entities have to inform the community about the activities they carry out in managing heritage assets, in order to allow the collectivity to express an opinion on the choices politicians make on the matter. The information-related needs of those using governmental financial reporting tools are represented by the information concerning the features of heritage assets, the performance levels in managing them, as well as the costs connected with specific policies, maintenance, and conservation.

A core set of information needs common denominators to all categories of stakeholders, such as the following: the assessment of the efficiency and effectiveness of services provided, evaluation of social and environmental impacts of public policies implemented, the degree of fiscal pressure, as well as the degree of achievement of the objectives and of programs' implementation.

In addition to these information-related needs, the management of heritage assets requires

additional disclosures concerning their specific features.

The importance of heritage assets creates a heavy debate about their recognition in the balance sheet and creates the need of accounting rules for the recognition, valuation, and disclosure for these types of assets.

Regarding the *recognition* of heritage assets, there is some common ground in relation to the usefulness of including heritage assets on the balance sheet. A number of national and international accounting standard boards consider that bringing heritage assets on the balance sheet would improve the quality of the information reported (Micallef and Peirson 1997).

The inclusion of heritage assets in the balance sheet could provide the opportunity for governments that hold them to obtain useful information about their nature and potential, in order to facilitate the achievement of objectives for decision-making and performance measurement (Barton 2005), whether this is for narrow economic purposes or for the wider social good.

The inclusion of heritage assets in the balance sheet points out the need to determine a book value that emphasizes the importance of their artistic, historical, and cultural features (Barton 2000). One issue in allocating a monetary value to these assets is that it focuses attention on market value, i.e., an exit value, rather than emphasizing their importance in artistic, historical, and cultural terms (Carnegie and Wolnizer 1995).

In terms of different methods of valuation for heritage assets, "fair value" is not generally a reliable measure. It is also costly and difficult to carry out. Where a market exists, an appropriate value for some heritage assets can be determined by considering their market price (e.g., a picture). Other valuation techniques such as replacement cost, reproduction cost, net present value, and deprival value are also difficult to carry out because they assume the existence of a ready market (Barton 2000).

Therefore, in many cases, "commercial valuations cannot serve as a reliable proxy for social valuation." The "reproduction cost" often is unknown and almost certainly irrelevant. The possibility of reconstructing the value of the asset may not lead to a reliable estimate of its original value (Barton 2000).

When no market exists, the traditional approach would be to use historical cost, as usually this is an objective way to measure asset value. However, in the case of heritage assets, unless they have been purchased recently, using historical cost may be devoid of meaning as even if it is possible to find such purchase cost, many of these assets are very old (Carnegie and Wolnizer 1995).

The historical cost could be representative of the value of a picture, of a collection, or a historical asset for the first recognition, but it cannot be representative of the current value because, due to their characteristics, the value of the heritage assets increases in the course of time. This implies the impossibility of finding a satisfactory evaluation method to be used for these goods that meet the objectives of financial reporting (Carnegie and Wolnizer 1995), although many methods of valuation that meet other purposes, e.g., insurance, agreed value, open market valuation, private treaty, are available.

The problems connected with the evaluation and recognition of heritage assets highlight the need to increase the relevant *disclosure requirements*. The information system for heritage assets should provide for the presence of more descriptive information, i.e., nonfinancial information relating to the objectives of entities holding the assets, the nature and features of the heritage assets owned, their physical condition, as well as the performance indicators (e.g., the number of visitors) (Stanton and Stanton 1997).

Nonfinancial and qualitative key performance measurements have an important role because they can be used by the users for assessing if the activities are carried out in an effective and efficient way.

## Accounting Practices in the International Scenario

Heritage assets are by a long time the subject of attention of authoritative standard setters in the international panorama. The IPSASB (International Public Sector Accounting Standard Board) addressed to the heritage assets two IPSASs (International Public Sector Accounting

Standards): the IPSAS n. 17 "Property plant and equipment" (2001) and IPSAS n. 31 "Intangible assets" (2010).

Two other important documents made their presence felt in the international scenario. They are the FRS (Financial Reporting Standard) n. 30 "Heritage Assets" issued in 2009 by the ASB (Accounting Standards Board) and the SFFAS (Statements of Federal Financial Accounting Standards) n. 29 "Heritage Assets and Land Stewardship," released in that same year by the FASAB (Federal Accounting Standards Advisory Board). These documents have the United Kingdom and the USA, respectively, as their context of reference.

## IPSAS n. 17 "Property Plant and Equipment"

The IPSAS document n. 17, issued in December 2001 and titled "Property plant and equipment," addresses the broad category of tangible assets. Within this category, the attention given to heritage assets is severely limited (paragraphs 9–12). This standard provides for a general definition, recalling a few examples and highlighting some distinctive features. Heritage assets are defined as activities possessing a particular cultural, environmental, or historical importance (IPSAS 17, paragraph 10) such as historical building, collections, monuments, archeological sites, and the like. The standard mentioned above does not require or prohibit their recognition (as seen in the aforementioned paragraphs 9–11) and allows (but does not require) the application of the regulations provided for tangible assets (paragraph 9). However, should a government decide to disclose heritage assets in its balance sheet, a number of disclosure requirements (paragraphs 88 to 94) are prescribed by IPSAS 17 and should be complied with (e.g., the measurement basis and the depreciation method used, as well as the gross-carrying amount). Concerning the first recognition, par. 26 refers to the costs incurred, which are assumed to be coincident with the fair value at the acquisition date (paragraph 37). In the cases of a donation, these assets must be estimated at fair value on the acquisition date (paragraph 27). Value measurements after the recognition may occur following two alternative criteria: either their historical cost (following the cost model) or their fair value (according to the revaluation model) recognized at the balance sheet date (paragraph 42). Depreciation and impairment losses must be taken into account in both cases. Finally, the choice of the evaluation criterion must also consider the potential services the heritage assets are able to provide, as it is, for example, the case of historic buildings also used as offices (paragraph 11).

Existing disclosure requirements imply that if alternative approaches to those given in that standard are applied to the valuation of inalienable and historic assets, then adequate disclosures should be provided by the different treatment, in relation to the age, scale, and nature of the assets held. IPSAS 17 divides disclosure requirement in:

- Existing information that the public entity should provide for each class of fixed assets (e.g., the measurement bases used for determining the gross-carrying amount; the depreciation methods used; the useful lives or the depreciation rates used)
- Information that the public entity should provide a presence of tangible fixed assets carried at revalued amounts (i.e., fair value) (e.g., the effective date of the revaluation; whether an independent valuer was involved; the methods and significant assumptions applied in estimating the assets' fair values)
- Additional information that the public entity should provide for a greater transparency and comprehensiveness (e.g., the existence and amounts of restrictions on title; the amount of expenditures recognized in the carrying amount of an asset in the course of its construction; the amount of contractual commitments for the acquisition of asset)

## The Consultation Paper "Accounting for Heritage Assets Under the Accrual Basis of Accounting"

The IPSASB has issued in 2006 a Consultation Paper (CP) entitled "Accounting for Heritage

Assets Under the Accrual Basis of Accounting." The document is largely predicated on the Discussion Paper (DP) "Heritage Assets: can accounting do better?" issued in the 2006 by the British standard setter; the CP was created with the goal of starting a debate that could culminate with the issue of a new standard, specific for heritage assets (or at least with a substantial revision of the contents of IPSAS 17). Its structure, therefore, essentially revolves around the contents of the DP of the ASB.

Regarding the recognition of heritage assets in the financial statements of public companies, the DP proposes three different methods (par. 3.1): mixed capitalization approach, full capitalization approach, and non-capitalization approach. Through their comparison, the ASB proposes to identify the one that is able to provide significant and useful information.

According to the mixed capitalization approach, in accordance with FRS 15, all material assets are recorded in the accounts on condition that there is an appropriate ratio "cost-benefit information to search for a value" (para. 3.2). Otherwise, the detection can be avoided. The evaluation of the cost-benefit ratio is done by the public entity, which will have to take decisions unambiguous in time and space.

The second methodology, the full capitalization approach, requires that all heritage assets have been registered in the balance sheet (par. 3.7) to a value that can be historical cost, the current value, or, in the cases allowed by individual national contexts, a figurative value (par. 3.8). In this way is reached the homogeneity of representation in the balance sheet of all heritage assets, even though there are possible inconsistencies between valuation methods.

Finally, the last methodology, non-capitalization approach, moves from the consideration that the heritage asset should not be recognized in the balance sheet, even in cases where they have been the object of recent transactions (par. 3.9). This will avoid the search for a value and ensures the adoption of an accounting policy unitary. In any case, it becomes necessary to identify an accounting treatment for acquisitions and disposals occurred in the current period. The choice is between a consideration of them as expenses to be included in income and expenditure account or a representation of them separately. The document encourages the use of this last solution.

Finally, paragraphs 5.6 and the following require the entities to provide some additional information, independently of the accounting method used (capitalization approach or non-capitalization approach). The information are represented by the accounting treatment adopted (in the case of use of non-capitalization approach, entities should indicate the reasons that prevented the capitalization), the origin of the resources used for the acquisition of these assets (distinguishing between transfers from the State, cash donations, donations of goods), the value assigned to sets of similar assets evaluated as a unit (collections), the transactions involving individual assets that belong to the set (i.e., new acquisitions), etc.

## IPSAS 31 "Intangible Assets"

The IPSAS No. 31 "Intangible Assets," issued in 2010, concerns the accounting treatment of intangible assets. Within the broad category of intangible assets, this standard dedicates its paragraphs 11–15 to intangible heritage assets, providing a fleeting definition thereof, some illustrative examples, and a reference to the rules provided by the standard setters for the evaluation and disclosure of tangible goods. Some intangible assets are considered to be a heritage because of their cultural, artistic, and historical relevance; for example, references are made to "records of significant historical events and rights to use the image of a public figure out, for example, stamps or coin collections public" (paragraph 12). Concerning the recognition of this specific category of assets, the standard does not require it (IPSAS 31, paragraph 11). However, if the heritage assets have been recognized, the same evaluation criteria provided for all other intangible assets should be applied. With regard to disclosure, the IPSAS No. 31 (paragraph 15) requires that the following information should be provided: evaluation

criteria used, the depreciation method used, if available, etc. With regard to the evaluation criteria, IPSAS 31 points out that it should revolve around the cost or fair value (IPSAS 31, paragraphs 31); this standard reiterates the choice between cost and fair value for the subsequent measurements as well (IPSAS 38, paragraph 71).

## FRS 30 "Heritage Assets"

The FRS 30 was issued by the ASB in 2009 and was applied to those accounting periods beginning from April 1, 2010 onwards. This principle subordinates the recognition of heritage assets in balance sheets to the availability of reliable information on their costs or values. If these information are available, heritage assets should be recognized separately from all other tangible assets (paragraph 19). In the absence of such information, heritage assets should not to be included in balance sheets (paragraph 20), but they should be an object of the disclosure, according to the directions set by paragraphs 6–15. Concerning book value, this principle extends the evaluation criteria provided by FRS 15 for tangible assets to heritage assets as well. In particular, it requires the use of appropriate and relevant criteria; if the current value has been used, carrying out a periodic review of these values is also required, in order to warrant the representation of "up to date" values. Paragraphs 6–15 set out the disclosure requirements to be provided for all heritage assets, be they recognized or unrecognized in balance sheets; further information should be provided for those assets not recognized, in order to compensate for the absence of relevant financial data.

Examples of disclosure requirements are nature and types of heritage assets owned; acquisition policies, conservation, management, and disposal; accounting policies and valuation criteria used; the reasons for non-recognition (for the assets not recognized), with reference to donations not evaluated; the reasons for which it is not possible to obtain a valuation of the assets donated; etc..

## SFFAS 29 "Heritage Assets and Stewardship Land"

The FASAB issued the SFFAS 29 standard in July 2005. This principle distinguishes heritage assets from stewardship land. This distinction is not only reflected in the relevant definitions but in the recognition criteria and disclosure requirements as well.

*Heritage assets* are (1) assets collectibles, such as museum collections, art collections, and library collections, and (2) noncollectible heritage assets, such as parks, monuments, and buildings (par. 15).

In addition to their intrinsic cultural function, some heritage assets are used for operational functions as well. An example thereof is given by those heritage assets used as office locations (the so-called multiuse heritage assets, described in paragraph 18 of this standard).

Concerning their evaluation and recognition criteria, those specified in paragraphs 19–21 are applied to heritage assets, while the criteria contained in paragraphs 22–24 apply to multiuse heritage assets. Regarding the recognition and evaluation of heritage assets, the SFASS 29 standard merely requires to insert the cost of their acquisition, improvement, reconstruction, or renovation in balance sheets, without any reference to their fair value. In the case of a donation, no value should be recognized.

In the case of donation, no value should be recognized; in support of this assertion, it carried out a reference to the paragraphs 258–259 of SFFAS 7, "Accounting for Revenue and Other Financing Sources," in which, in fact, it is stated that the assets are recognized only if they have been the object of acquisition and not when received in donation.

For multiuse heritage assets, the cost of their acquisition, improvement, reconstruction, or renovation must be capitalized and subsequently depreciated considering their estimated useful life. The goods received through donations must be recognized at fair value, to be determined at the date of receipt of the asset.

Finally, concerning disclosure, the SFFAS No. 29 standard prescribes that the entities

owning heritage assets and multiuse heritage assets have to provide information in their notes concerning the purposes of the entity, the policies connected with the specific heritage assets, the physical condition of the assets, and the like.

The concept of *stewardship land* is related to those tracts of land owned by the US federal government, such as forests, parks, and land used for wildlife and grazing. Should this land be purchased to build a property, a plant, or for any kind of equipment, it has to be accounted for in compliance with the specific rules defined for these categories of assets; on the contrary, should these connections be absent, the land stewardships should be acknowledged within the total cost incurred for land acquisition and preparation for its destined use.

Also, for the stewardship land received in donation, with reference to the paragraphs 258–259 of SFFAS 7, no value should be recognized. At the end of the day, disclosure is made up of the following information (as detailed in paragraphs 40–41): the purpose of the entity; the policies provided for the acquisition, maintenance, the use and disposal of the concerned land stewardship; as well as the main acquisition methods used for the stewardship land owned.

## Conclusion

Among the responsibilities that typically are handled by the government is the protection and enhancement of heritage assets.

Heritage assets are particular goods, which require the preparation of accounting rules ad hoc (Barton 2000). Information tools implemented in relation to those elements of capital are insufficient to reflect their specificity. Furthermore, even academics and accounting and legislative bodies do not seem to devote to heritage assets the attention they deserve in relation to their concrete.

In particular, about the information to be produced in the governmental financial reporting, often there are regulations that simply transpose concepts and methods from the private sector to the assets of the public sector, without considering most of the specific characteristics of heritage assets (Stanton and Stanton 1997). Particularly with reference to the evaluation aspects, there are found rules and behaviors that do not fit with the features of uniqueness and non-repeatability, typically of heritage assets.

There was an effort specifically addressed to resolve the account problems of the heritage assets, but, after an initial enthusiasm, the process has been halted and no action was carried out.

In any case, it is strongly increased the role of the supplementary disclosure that tends to become substitute of accounting information in the strictest sense. Some progress in the measurement of the economic values of heritage assets could be found in the use of new tools such as the contingent valuation method, the travel cost method, and the cost-benefit analysis.

# Heroic Leaders

Scott T. Allison, Kara E. Cromwell and Smaragda P. Spyrou
Department of Psychology, University of Richmond, Richmond, VA, USA

## Synonyms

Ethical leaders; Personal transformation; Servant leaders; Transforming leaders

## Definition

Heroic leadership is the zenith of leadership, founded on the principles of heroism science.

## Introduction

Heroic leadership is the zenith of leadership, founded on the principles of heroism science (Allison et al. 2017). A hero is defined as an individual who (a) voluntarily takes actions that are deemed to be exceptionally good or that are directed toward serving a noble principle, (b) makes a significant sacrifice, and (c) takes a great risk. Franco et al. (2011) offer this definition: "Heroism is the willingness to sacrifice or take risks on behalf of others or in defense of a moral cause" (p. 13). Allison and Goethals (2011) define heroism as "doing the right thing at a critical moment," with the right thing involving a combination of great morality and great competence (p. 9). Heroes do the right thing and do what they must do, regardless of authority, tradition, and consequence (Allison and Goethals 2017). Merriam-Webster's definition of hero also adds that a hero draws admiration from others, a recognition aspect of heroism that most scholars do not include in their definitions.

## The Heroic Leader's Life Journey

Campbell (1949) described the classic hero's journey as follows: "A hero ventures forth from the world of common day into a region of supernatural wonder: fabulous forces are there encountered and a decisive victory is won: the hero comes back from this mysterious adventure with the power to bestow boons on his fellow man" (p. 30). Hero tales from antiquity to modern times follow the same clear and predictable pattern. The hero is an ordinary person who is summoned on a journey away from her or his safe, familiar world to a new and special world fraught with danger. At the outset of the journey, the hero is missing an important quality, usually self-confidence, humility, or a sense of her true purpose in life. The hero journey is always a voyage toward self-realization and transformation (Allison and Goethals 2014; Allison and Smith 2015). Receiving assistance from enchanted and unlikely sources, the hero develops remarkable cunning, courage, and resourcefulness to triumph. Once successful, the hero returns to her original familiar world ready to bestow a boon to society. In all, the hero's journey describes a transformative process that turns ordinary people into heroic leaders.

## The Role of Transformation

The hero transformation occupies a central place in the heroic leader's journey, and it serves five purposes. First, hero transformations foster developmental growth. The hero's journey is seen as a metaphor for successful passage through the various stages of life from birth to death. Early human societies recognized the value of initiation rituals in promoting the transition from childhood to adulthood (Allison 2015). Campbell (1988) lamented the failure of postmodern society to recognize the psychological importance of rites and rituals. Coming-of-age stories are common in mythic hero tales about children confronting new worlds, fraught with danger, that must be conquered for entry into later developmental

stages. The second purpose of hero transformations resides in their ability to promote healing. The simple act of sharing stories about hero transformations can instill hope, foster self-awareness, relieve stress, and cultivate a sense of meaning. The third purpose of hero transformations resides in their ability to deepen spiritual and cosmic understanding. Campbell (1988) observed that the hero's transformation involves learning "to experience the supernormal range of human spiritual life" (p. 152). Hero myths, he said, "bring us into a level of consciousness that is spiritual" (p. 19).

The fourth purpose of hero transformations lies in their capacity to cultivate social unity. Campbell (1972) argued that hero transformations "drop or lift [heroes] out of themselves, so that their conduct is not their own but of the species, the society" (p. 57). The transformed individual has moved "from the lesser, secondary knowledge of himself as separate from others" to "the greater, truer truth, that we are all one in the ground of our being" (p. 151). Transformed heroic leaders are "selfless, boundless, without ego." No longer isolated from the world, transformed individuals enjoy a feeling of union with others. In describing the hero's journey, Campbell (1949) wrote, "where we had thought to be alone, we shall be with all the world" (p. 25).

The fifth purpose of hero transformations is they advance society. The culmination of the hero's journey is the hero's boon, or gift, to society. This gift is what separates the hero's journey from merely a test of personal survival. For the voyage to be heroic, the protagonist in myth must use her newly acquired insights and gifts to better the world. The heroic boon to society follows the successful completion of the individual quest, making the social boon dependent on the hero's personal transformation needed for the personal quest to succeed. Hero mythology, according to Campbell (1972), is designed to teach us that society is not a "perfectly static organization" but represents a "movement of the species forward" (p. 48). During the process of experiencing personal transformation, the hero obtains the "elixir" that empowers and enables her to help guide others on their personal transformative journeys. This idea is consistent with contemporary theories of leadership that focus on the role of enlightened leaders to transform their followers, elevating them toward greater levels of motivation and morality (Burns 1978).

## Transformational Patterns

There are three patterns that characterize the transformations undergone by heroic leaders. First, there is a shift in mind-set from egocentricity to sociocentricity (Allison and Goethals 2017). According to Campbell (1988), "when we quit thinking primarily about ourselves and our own self-preservation, we undergo a truly heroic transformation of consciousness" (p. 155). Campbell believed that one of the central functions of hero mythology is to connect the hero with the greater social world. In most hero narratives, the hero begins the journey as a disconnected, self-centered, prideful individual whose sole priority is establishing identity, career, and material goods. The primary goal of the heroic leader's journey is to awaken the hero to the larger, deeper task of thinking beyond herself, to developing communion with everyone and with everything. In short, the heroic life is one that nurtures a compassionate unification with all of humanity.

The second pattern of heroic transformation describes heroic leaders as undergoing a form of social growth that can be described as a shift from dependency to autonomy (Allison and Goethals 2017). Campbell (1988) believed that western cultures promote dependency by emphasizing a preoccupation with safety, security, socioeconomic well-being, and entertainment. The untransformed person's behavior and identity are steeped in consumerism, materialism, competition, violence, and nationalism. This emphasis on the lower-level needs in Maslow's (1943) hierarchy stunts people's transformative growth. A person's willingness to deviate from the dominant cultural pattern is essential for heroic transformation. Heroes do the right thing and do what they must do, regardless of authority, tradition, and consequence. Maslow called this characteristic autonomy. "There are the 'strong' people," wrote Maslow, "who can easily weather

disagreement or opposition, who can swim against the stream of public opinion and who can stand up for the truth at great personal cost" (p. 379). Fulfillment of the lower needs in the pyramid is essential for autonomy to develop in individuals. The world's greatest heroic leaders have been fearless in their autonomy. Jesus of Nazareth was a revolutionary who defied the conventions of his culture. Other similar examples are Martin Luther King, Jr., Joan of Arc, Malcolm X, Harvey Milk, and Mahatma Gandhi.

The third heroic transformation is the change from stagnation to growth (Allison and Goethals 2017). One can be sociocentric and autonomous but not necessarily growing toward realizing one's full potential. The hero must leave home and venture on the journey to obliterate a status quo that is no longer working. The pre-transformed hero resists change, and severe setbacks and considerable suffering may be her only impetus to grow. Without a prod, she will remain comfortable in her stagnation, oblivious to the idea that anything needs changing. For this reason, many spiritual traditions call the hero's journey an awakening to one's true calling in life, also described as the death of the false self and the birth of the true self. Campbell (1988) described the process as "killing the infantile ego and bringing forth an adult" (p. 168).

## The Heroic Leader as Mentor

A pivotal social event during the hero's journey is the arrival of the mentor figure. In classic myth, the mentor is often a magical outsider, an elder, an exotic person, or a creature whom one would least expect to possess the wisdom needed for the hero to succeed. The majority of people who are asked to name their heroes mention a mentor or coach who had a transformative effect on them (Allison and Goethals 2011). As legendary football coach Tom Landry observed, a mentor is someone "who tells you what you don't want to hear, who has you see what you don't want to see, so you can be who you have always known you could be" (Farcht 2007, p. 294). Famous mentors in hero tales include Merlin the Magician giving King Arthur the knowledge to rule England, Yoda helping Luke Skywalker defeat Darth Vader, and Mr. Miyagi training the Karate Kid. Good mentors equip the hero with what she/he needs, but there can also be dark mentors who steer the hero down a dark path of self-destruction (Allison and Smith 2015). Examples of dark mentors include the serpent in Genesis 3:4, Sauron in *The Lord of the Rings*, Terence Fletcher in *Whiplash*, and Tyler Durden in *The Fight Club*.

## Temporal Sequencing of Mentoring

The temporal sequencing of mentorship is an important element of the hero's journey. Mentors help heroes become transformed, and later, having succeeded on their journeys, these transformed heroes then assume the role of mentor for others who are at earlier stages of their quests. In short, "transformed people transform people" (Rohr 2014, p. 263). Mentors can have a transformative effect with their words of advice, with their actions, or both. Words can fall on deaf ears, but one's actions, attitudes, and lifestyle can leave a lasting imprint. St. Francis of Assisi conveyed it this way: "You must preach the Gospel at all times, and when necessary use words" (p. 263).

The hero's journey prepares people for leadership and mentoring roles by offering a transformative experience that can be shared later with others. Burns (1978) argued that transforming leaders make an effort to satisfy followers' lower needs (e.g., survival and safety), thereby elevating them for the important work that everyone must do together to produce significant higher-level changes. Leaders create a "new cadre of leaders" (p. 20). This conception is consistent with Campbell's ideas about the role of mentorship during the hero's journey, with the mentor elevating the hero, thereby preparing her to become a mentor later. Burns' framework also makes explicit a notion that is largely implicit in Maslow's (1943) model, namely, that the self-actualized person has become an elder, a mentor figure, and a moral actor who wields transformative influence over others.

Other theories also point to the transformative effect of mentoring and leadership. Hollander (1995) has proposed a two-way influence

relationship between a leader and followers aimed primarily at attaining mutual goals. Hollander defined leadership as "a shared experience, a voyage through time" with the leader in partnership with followers to pursue common interests. For Hollander, "a major component of the leader–follower relationship is the leader's perception of his or her self relative to followers, and how they in turn perceive the leader" (p. 55). Tyler and Lind (1992) have shown that these perceptions are critically important in cementing good follower loyalty. Followers will perceive a leader as a "legitimate" authority when she adheres to basic principles of procedural justice. Leaders who show fairness, respect, and concern for the needs of followers are able to build followers' self-esteem, a pivotal step in Maslow's (1943) pyramid, thereby fostering followers' transformative movement toward meeting higher-level needs.

Mentors and leaders can also use their charisma to exert a transformative effect on their followers. Goethals and Allison (2014) reviewed the transforming leadership of three heroic leaders from the twentieth century whom they dubbed the three kings of heroic leadership: Muhammad Ali, Elvis Presley, and Martin Luther King, Jr. These kings radiated powerful charisma that transformed their followers. All three kings had exceptional personas. The three also made an emotional connection with their audiences, and all three related and embodied compelling stories. Moreover, the three kings enacted theatrical leadership that gave people what they wanted and needed. Two of them, King and Ali, used words, delivered in riveting styles, often touching on religious themes, to influence their followers' thoughts, feelings, and behavior. The three kings used their charisma to transform others, through both their words and their example.

## Transforming Others

Burns (1978) proposed that leaders and followers raise each others' motivation and morality, and he suggested mechanisms that are backed by recent research. Heroic leaders lead by example, demonstrating high degrees of competence and morality to followers (Allison and Goethals 2011, 2013). Heroic leaders are moral exemplars who evoke a unique emotional response which Jonathan Haidt and his colleagues have called elevation (Haidt 2003). Haidt borrowed the term "elevation" from Thomas Jefferson, who used the phrase moral elevation to describe the euphoric feeling one gets when reading great literature. When people experience elevation, they feel a mix of awe, reverence, and admiration for a morally beautiful act. The emotion is described as similar to calmness, warmth, and love. Haidt argues that elevation is "elicited by acts of virtue or moral beauty; it causes warm, open feelings in the chest." Most importantly, the feeling of elevation has a concomitant behavioral component: A desire to become a better person. Elevation motivates people to behave more virtuously themselves. A form of moral self-efficacy, elevation transforms people into believing they are capable of engaging in significant prosocial action. Abundant research evidence supports this idea (Allison et al. 2017; Csikszentmihalyi et al. 2017).

The importance of leaders and leadership in cultivating a heroic motive in followers is highlighted by Howard Gardner (1995). Gardner proposed that leaders influence significant numbers of their fellow human beings through their words and example and that they do so through stories that they both relate and embody. Furthermore, the most powerful stories are stories about identity, about the leader's identity and followers' personal identities and the identity of their group. The story concept underlines the fact that leaders frequently offer a dynamic perspective about where a group has come from, where it is going, and what obstacles it has faced and is facing. Leaders and followers are central and heroic figures in these dramatic narratives. Gardner's examples include Robert Oppenheimer who successfully led the Manhattan Project to completion by relating, through what he said and what he did, a story of dedicated scientists pushing back the frontiers of knowledge to build a weapon that would win the war against despotism but also, perhaps, make future wars unthinkable. That story was important in mobilizing thousands of

young scientists toward the common goal of creating the atomic bomb. Another example is Pope John XXIII, who reached back to the early teachings of Jesus to relate a story about a caring, nonhierarchical, inclusive church that concerned itself with uplifting the human condition.

## Conclusion

The world's most revered leaders have traveled the hero's journey of personal transformation and, in turn, have used their gifts to transform others (Allison and Goethals 2017; Rohr 2011). Martin Luther King, Jr., came from humble origins to organize the American civil rights movement. He transformed himself and then heroically transformed others, as evinced in his famous quote: "Life's most persistent and urgent question is: what are you doing for others?" (King 2001, p. 3). The hero's journey also characterizes the lives of indirect leaders such as Helen Keller. Born with illness that left her without sight or hearing, Keller overcame her severe disability to achieve a life of extraordinary philanthropy and humanitarianism. She said, "I long to accomplish a great and noble task, but it is my chief duty to accomplish humble tasks as though they were great and noble" (Wallis 1983, p. 240). Keller's personal transformation played a role in transforming the world.

The heroic leader's journey is the human journey, replete with struggle, growth, learning, transformation, and an ascendency from followership to heroic leadership (Goethals and Allison 2016). Those who dare to transform, or who are compelled to do so by circumstance, grow into fully developed human beings ready, willing, and able to transform others (Rohr 2011). The transformed hero represents the pinnacle of human maturity, the state of well-being that allows people to flourish (Seligman 2011) and experience eudaimonia (Franco et al. 2016). For Buddhists, the highest state of enlightenment is nirvana, a state of bliss when one is reborn into a new life and free from all suffering. For Hindus, this ultimate state of bliss is ananda, and for Muslims it is taqwa. Peterson and Seligman (2004) identified six universal human character virtues: wisdom, courage, humanity, justice, temperance, and transcendence. The six virtues closely match Campbell's (1949) description of the transformed heroic leader. As a result of their journeys, heroic leaders acquire wisdom about themselves and the world; they develop the courage to face their inner dragons, they are in union with all of humanity, they pursue justice even at a cost to themselves, they are humbled and tempered, and they use their acquired gifts to unify the world.

# Heroic Leadership

Scott T. Allison
Department of Psychology, University of Richmond, Richmond, VA, USA

## Synonyms

Consummate leadership; Heroism; Leadership

## Definition

Heroic leadership is the pinnacle of leadership, conducted by a transformed and enlightened leader who seeks to transform and enlighten others.

## Introduction

Heroic leadership is the pinnacle of leadership, founded on the principles of heroism. A hero is defined as an individual who (a) voluntarily takes actions that are deemed to be exceptionally good, or that are directed toward serving a noble principle or the greater good; (b) makes a significant sacrifice, and (c) takes a great risk. Franco et al. (2011) offer this definition: "Heroism is the willingness to sacrifice or take risks on behalf of others or in defense of a moral cause" (p. 13). Allison and Goethals (2011) define heroism as "doing the right thing at a critical moment," with the right thing involving a combination of great morality and competence (p. 9). Merriam-Webster's definition of hero also adds that a hero attracts admiration from others, a *recognition* aspect of heroism that most scholars do not include in their definitions.

## The Journey of the Heroic Leader

Campbell (1949) described the classic hero's journey in this way: "A hero ventures forth from the world of common day into a region of supernatural wonder: fabulous forces are there encountered and a decisive victory is won: the hero comes back from this mysterious adventure with the power to bestow boons on his fellow man" (p. 30). Hero tales from antiquity to modern times follow the same clear and predictable pattern. The hero is an ordinary person who is summoned on a journey away from her safe, familiar world to a new and special world fraught with danger. At the outset of the journey, the hero is missing an important quality, usually self-confidence, humility, or a sense of her true purpose in life. The hero journey is always a voyage toward self-realization and

transformation (Allison and Goethals 2014; Allison and Smith 2015). Receiving assistance from enchanted and unlikely sources, the hero develops remarkable cunning, courage, and resourcefulness to triumph. Once successful, the hero returns to her original familiar world ready to bestow a boon to the entire community. In all, the hero's journey describes a transformative process that turns ordinary people into heroic leaders.

### The Role of Transformation

The hero transformation occupies a central place in the heroic leader's journey, and it serves five purposes. First, hero transformations foster developmental growth. The hero's journey is seen as a metaphor for successful passage through the various stages of life from birth to death. Early human societies recognized the value of initiation rituals in promoting the transition from childhood to adulthood (Allison 2015). Campbell (1988) lamented the failure of postmodern society to recognize the psychological importance of rites and rituals. Coming-of-age stories are common in mythic hero tales about children confronting new worlds, fraught with danger, that must be conquered for entry into later developmental stages. A second purpose of hero transformations resides in their ability to promote healing. The simple act of sharing stories about hero transformations can instill hope, foster self-awareness, relieve stress, and cultivate a sense of meaning. A third purpose of hero transformations is they deepen spiritual and cosmic understanding. Campbell (1988) observed that the hero's transformation involves learning "to experience the supernormal range of human spiritual life" (p. 152). Hero myths, he said, "bring us into a level of consciousness that is spiritual" (p. 19).

A fourth purpose of hero transformations lies in their ability to cultivate social unity. Campbell (1972) argued that hero transformations "drop or lift [heroes] out of themselves, so that their conduct is not their own but of the species, the society" (p. 57). The transformed individual has moved "from the lesser, secondary knowledge of himself as separate from others" to "the greater, truer truth, that we are all one in the ground of our being" (p. 151). Transformed heroic leaders are "selfless, boundless, without ego." No longer isolated from the world, transformed individuals enjoy a feeling of union with others. In describing the hero's journey, Campbell (1949) wrote, "where we had thought to be alone, we shall be with all the world" (p. 25). The fifth purpose of hero transformations is they advance society. The culmination of the hero's journey is the hero's boon, or gift, to society. This gift is what separates the hero's journey from simply a test of personal survival. For the voyage to be heroic, the protagonist in myth must use her newly acquired insights and gifts to better the world. The heroic boon to society follows the successful completion of the individual quest, making the social boon dependent on the hero's personal transformation that made the personal quest a success. Hero mythology, according to Campbell (1972), is designed to teach us that society is not a "perfectly static organization" but represents a "movement of the species forward" (p. 48). During the process of experiencing personal transformation, the hero obtains the "elixir" that empowers and enables her to help guide others on their personal transformative journeys. This idea is consistent with contemporary theories of leadership that focus on the role of enlightened leaders to transform their followers, elevating them toward greater levels of motivation and morality (Burns 1978).

### Transformational Patterns

There are three patterns that characterize the transformations undergone by heroic leaders. First, there is a shift in mindset from *egocentricity* to *sociocentricity*. According to Campbell (1988), "when we quit thinking primarily about ourselves and our own self-preservation, we undergo a truly heroic transformation of consciousness" (p. 155). Campbell believed that one of the central functions of hero mythology is to connect one with the greater social world. In most hero narratives, the hero begins the journey as a disconnected, self-centered, prideful individual whose sole preoccupation is establishing identity, career, and material goods. The primary goal of the heroic leader's journey is to awaken the hero to the larger, deeper task of thinking beyond herself, to developing communion with everyone and with everything.

In short, the heroic life is one that nurtures a compassionate unification with all of humanity.

A second pattern of heroic transformation describes heroic leaders as undergoing a form of social growth that can be described as a shift from *dependency* to *autonomy* (Allison and Goethals 2017). Campbell (1988) believed that western cultures promote dependency by emphasizing a preoccupation with safety, security, socioeconomic well-being, and entertainment. People's behavior and identity are steeped in consumerism, materialism, competition, violence, and nationalism. This emphasis on the lower-level needs in Maslow's (1943) hierarchy stunts people's transformative growth. A person's willingness to deviate from the dominant cultural pattern is essential for heroic transformation. Heroes do the right thing, and do what they must do, regardless of authority, tradition, and consequence. Maslow called this characteristic *autonomy*. "There are the 'strong' people," wrote Maslow, "who can easily weather disagreement or opposition, who can swim against the stream of public opinion and who can stand up for the truth at great personal cost" (p. 379). Fulfillment of the lower needs in the pyramid is essential for autonomy to develop in individuals. The world's greatest heroic leaders have been fearless in their autonomy. Jesus of Nazareth was a revolutionary who defied the conventions of his culture. Other similar examples are Martin Luther King, Jr., Joan of Arc, Malcolm X, Harvey Milk, and Mahatma Gandhi.

The third heroic transformation is the change from *stagnation* to *growth*. One can be sociocentric and autonomous but not necessarily growing and stretching toward realizing one's full potential. The hero must leave home and venture on the journey to obliterate a status quo that is no longer working. The pre-transformed hero resists change, and severe setbacks may be her only impetus to grow. Without a prod, she will remain comfortable in her stagnation, oblivious to the idea that anything needs changing. For this reason, many spiritual traditions call the hero's journey an awakening to one's true calling in life, also described as the death of the false self and the birth of the true self. Campbell (1988) described the process as "killing the infantile ego and bringing forth an adult" (p. 168).

## The Heroic Leader as Mentor

One of the most essential social events of the hero's journey is the arrival of the mentor figure. In classic myth, the mentor is often a magical outsider, an elder, an exotic person or creature whom one would least expect to possess the wisdom needed for the hero to succeed. The majority of people who are asked to name their heroes mention a mentor or coach who had a transformative effect on them (Allison and Goethals 2011). As legendary football coach Tom Landry observed, a mentor is someone "who tells you what you don't want to hear, who has you see what you don't want to see, so you can be who you have always known you could be" (Farcht 2007, p. 294). Famous mentors in hero tales include Merlin the Magician giving King Arthur the knowledge to rule England, Yoda helping Luke Skywalker defeat Darth Vader, and Mr. Miyagi training the Karate Kid. Good mentors equip the hero with what she needs, but there can also be dark mentors who steer the hero down a dark path of self-destruction (Allison and Smith 2015). Examples of dark mentors include the serpent in *Genesis 3:4*, Sauron in *Lord of the Rings*, Terence Fletcher in *Whiplash*, and Tyler Durden in *The Fight Club*.

### Temporal Sequencing of Mentoring

The temporal sequencing of mentorship is an important element of the hero's journey. Mentors help heroes become transformed, and later, having succeeded on their journeys, these transformed heroes then assume the role of mentor for others who are at earlier stages of their quests. In short, "transformed people transform people" (Rohr 2014, p. 263). Mentors can have a transformative effect with their words of advice, with their actions, or both. Words can fall on deaf ears but one's actions, attitudes, and lifestyle can leave a lasting imprint. St. Francis of Assisi conveyed it this way: "You must preach the Gospel at all times, and when necessary use words" (p. 263).

The hero's journey prepares people for leadership and mentoring roles by offering a transformative experience that can be shared later with others. Burns (1978) argued that transforming leaders make an effort to satisfy followers' lower needs (e.g., survival and safety), thereby elevating them for the important work that they – leaders *and* followers – must do together to produce significant higher-level changes. Leaders create a "new cadre of leaders" (p. 20). This conception is consistent with Campbell's ideas about the role of mentorship during the hero's journey, with the mentor elevating the hero, thereby preparing her to become a mentor later. Burns' framework also makes explicit a notion that is largely implicit in Maslow's (1943) model, namely, that the self-actualized person has become an elder, a mentor figure, and a moral actor who wields transformative influence over others.

Other theories also point to the transformative effect of mentoring and leadership. Hollander (1995) has proposed a two-way influence relationship between a leader and followers aimed primarily at attaining mutual goals. Hollander defined leadership as "a shared experience, a voyage through time" with the leader in partnership with followers to pursue common interests. For Hollander, "a major component of the leader–follower relationship is the leader's perception of his or her self relative to followers, and how they in turn perceive the leader" (p. 55). Tyler and Lind (1992) have shown that these perceptions are critically important in cementing good follower loyalty. Followers will perceive a leader as a "legitimate" authority when she adheres to basic principles of procedural justice. Leaders who show fairness, respect, and concern for the needs of followers are able to build followers' self-esteem, a pivotal step in Maslow's (1943) pyramid, thereby fostering followers' transformative movement toward meeting higher-level needs.

Mentors and leaders can also use their charisma to exert a transformative effect on their followers. Goethals and Allison (2014) reviewed the transforming leadership of three heroic leaders from the twentieth century whom they dubbed *the three kings* of heroic leadership: Muhammad Ali, Elvis Presley, and Martin Luther King, Jr. These kings radiated powerful charisma that transformed their followers. All three kings had exceptional personas. All three made an emotional connection with their audiences. All three related and embodied compelling stories. All three enacted theatrical leadership that gave people what they wanted and needed. Two of them, King and Ali, used words, delivered in riveting styles, often touching on religious precepts, to influence their followers' thoughts, feelings, and behavior. The three kings used their charisma to transform others, through both their words and their example.

## Transforming Others

Burns (1978) proposed that leaders and followers raise each others' motivation and morality, and he suggested mechanisms that are backed by recent research. Heroic leaders lead by example, demonstrating high degrees of competence and morality to followers (Allison and Goethals 2011, 2013). Heroic leaders are moral exemplars who evoke a unique emotional response which Jonathan Haidt and his colleagues have called *elevation* (Haidt 2003). Haidt borrowed the term "elevation" from Thomas Jefferson, who used the phrase *moral elevation* to describe the euphoric feeling one gets when reading great literature. When people experience elevation, they feel a mix of awe, reverence, and admiration for a morally beautiful act. The emotion is described as similar to calmness, warmth, and love. Haidt argues that elevation is "elicited by acts of virtue or moral beauty; it causes warm, open feelings in the chest." Most importantly, the feeling of elevation has a concomitant behavioral component: A desire to become a better person. Elevation motivates people to behave more virtuously themselves. A form of moral self-efficacy, elevation transforms people into believing they are capable of engaging in significant prosocial action. Abundant research evidence supports this idea (Allison et al. 2017; Csikszentmihalyi et al. 2017).

The importance of leaders and leadership in fostering a heroic motive in followers is highlighted by Gardner (1995). Gardner proposed

that leaders influence significant numbers of their fellow human beings through their words and example and that they do so through stories that they both relate and embody. Furthermore, the most powerful stories are stories about identity, about the leader's identity and followers' personal identities and the identity of their group. The story concept underlines the fact that leaders frequently offer a dynamic perspective, about where a group has come from, where it is going, and what obstacles it has faced and is facing. Leaders and followers are central and heroic figures in these dramatic narratives. Gardner's examples include Robert Oppenheimer who successfully led the Manhattan Project to completion by relating, through what he said and what he did, a story of dedicated scientists pushing back the frontiers of knowledge to build a weapon that would win the war against despotism but also, perhaps, make future wars unthinkable. That story was important in mobilizing thousands of young scientists toward the common goal of creating the atomic bomb. Another example is Pope John XXIII, who reached back to the early teachings of Jesus to relate a story about a caring, nonhierarchical, inclusive church that concerned itself with uplifting the human condition.

## Conclusion

The world's most revered leaders have traveled the hero's journey of personal transformation and, in turn, have used their gifts to transform others (Rohr 2011). Martin Luther King, Jr. came from humble origins to organize the American civil rights movement. He transformed himself and then heroically transformed others, as evinced in his famous quote: "Life's most persistent and urgent question is: what are you doing for others?" (King 2001, p. 3). The hero's journey also characterizes the lives of indirect leaders such as Helen Keller. Born with illness that left her without sight or hearing, Keller overcame her severe disability to achieve a life of extraordinary philanthropy and humanitarianism. She said, "I long to accomplish a great and noble task, but it is my chief duty to accomplish humble tasks as though they were great and noble" (Wallis 1983, p. 240). Keller's personal transformation played a role in transforming the world.

The heroic leader's journey is the human journey, replete with struggle, growth, learning, transformation, and an ascendency from followership to heroic leadership (Goethals and Allison 2017). Those who dare to transform, or who are compelled to do so by circumstance, grow into fully developed human beings ready, willing, and able to transform others (Rohr 2011). The transformed hero represents the pinnacle of human maturity, the state of well-being that allows people to flourish (Seligman 2011) and experience eudaimonia (Franco et al. 2016). For Buddhists, the highest state of enlightenment is *nirvana*, a state of bliss when one is reborn into a new life and free from all suffering. For Hindus, this ultimate state of bliss is *ananda*, and for Muslims it is *taqwa*. Peterson and Seligman (2004) identified six universal human character virtues: *wisdom, courage, humanity, justice, temperance*, and *transcendence*. The six virtues closely match Campbell's (1949) description of the transformed heroic leader. As a result of their journeys, heroic leaders acquire wisdom about themselves and the world; they develop the courage to face their inner dragons; they are in union with all of humanity; they pursue justice even at a cost to themselves; they are humbled and tempered; and they use their acquired gifts to unify the world.

# Higher Education Governance and Reforms

Elias Pekkola and Jussi Kivistö
School of Management, University of Tampere, Tampere, Finland

## Synonyms

Tertiary Education Management and Policy Changes

## Introduction

In many countries, higher education systems have gone through a significant and rapid transition from being elite to being mass or universal in a relatively short period of time. "Elite" higher education can be understood as a historical approach to providing higher education to only a privileged few that preceded the transition to higher education for all (Trow 1974). It was characterized by limited and selective access based on birth, talent, or both of these; highly structured curricula; uninterrupted, full-time studies directly after secondary education; a small number of homogenous universities; institutional governance of small elite groups who shared basic values and assumptions in decision-making; and broadly shared and relatively high academic standards. In contrast, modern mass higher education is characterized

by larger access with meritocratic criteria, flexible curricula, direct or delayed entry after secondary education, comprehensive institutions with diverse standards, and structured institutional governance with a broad representation of various stakeholders (Trow 2006; Kivistö and Tirronen 2012).

The transformation from elitist to universal has made higher education an increasingly important topic on policy agendas in many countries. The common expectation that a well-functioning higher education sector is a significant driver of economic growth, societal stability, and national economic competitiveness in an increasingly knowledge-driven global economy has increased the importance of higher education as a policy priority at the highest level. However, higher education policymaking is connected to the general political culture and general policy traditions of each nation. Higher education policy, as other policy fields, imports ideas and agendas from both abroad and from home as it searches for alternative ways of improving system performance.

In line with these developments, the objective of this chapter is to introduce higher education in the context of public policies, reforms, and institutional governance. In doing so, the chapter also presents views about the past, present, and future roles of higher education in modern societies in general and in the context of public sector reforms in particular.

## Characteristics of Higher Education as a Field of Public Policy

Higher education policy can be broadly defined as a course of government action or inaction in response to public problems (directly or indirectly) related to higher education (cf. Kraft and Furlong 2006). Due to the interconnected nature of higher education, its thematic demarcation as a specific policy field is challenging. There are three main reasons for this. Firstly, higher education as an institutional sector houses three distinct but interwoven missions, namely education (teaching and learning), research, and societal service. These functions may or may not be steered from different ministries under different policies. Typically, higher education institutions or part of their functions fall under the auspices of the Ministry of Education; the Ministry of Science, Technology and Innovation; or the Ministry of Skills and Employment. Secondly, higher education is closely linked to the professions and the core tasks of the state. This means that some higher education institutions and fields of education can operate directly under several sectorial ministries (e.g., military or defense academies, police academies, universities of technology, medical schools, law schools, etc.). Lastly, higher education policy is a combination of research, innovation, technology, education, trade, skill, and competition policies. Professions, administrative sectors, and sectorial ministries all have a strong interest in defining the higher education policy in their own field of knowledge, so higher education institutions are also in their interest.

The high policy relevance of higher education is based on the multiple roles it plays in modern societies. One of the key roles of higher education is to increase the level of human capital in a society by offering and disseminating knowledge, skills, and competencies. In doing so, from an economic perspective, higher education institutions produce outputs that can be categorized as "public" or "private" goods (Samuelson 1954). Higher education creates multiple social and economic public benefits, thereby justifying significant public investments in higher education. This includes economic benefits, such as greater national productivity and development, reduced risk of unemployment, and lower reliance on public support, but, more importantly, it has noneconomic benefits, such as lower crime rates, better health, more social cohesion and mobility, more informed citizens, societal stability, and improved primary and secondary education (Steier 2003). At the same time, higher education (both research and/or teaching) may play an important role as an exported service. The higher education market is becoming increasingly global and highly competitive. In some countries, like in Australia, higher education is one of the major fields of export. However, in many cases, higher education is a tight part of the national

economy and mostly funded with tax revenues and/or tuition fees paid by local students.

The higher education sector plays a dual role in broader administrative reforms affecting the public sector. On the one hand, it is an *object* of different policies concerning higher education. In addition, to the extent that public higher education institutions are part of wider body of public administration, they are also often subjected to those administrative reforms which are affecting public administration in general. On the other hand, higher education sector is often an important *actor* in reforms due to its expertise in creating the knowledge base for policy development. For instance, higher education institutions train most policymakers, conduct research supporting evidence-based policymaking, offer to advise legislators, and participate in evaluating the impacts of reforms.

Higher education is linked with many vital policy fields, and it has strong connections with professional work and societal power. Because of its relations to important resources and privileges, higher education is a policy field of strong national interest. For example, national qualifications, the right to grant degrees, curricula, and institutional prerogatives are often considered strategically important functions for society and are therefore often strictly regulated at national level. At the same time, academic research as an activity is a highly international endeavor, and the professionals within academia are strongly committed to their global disciplinary networks where people, ideas, knowledge, and the latest trends in epistemological paradigms are moving across national borders. These two elements make the steering and policy implementation in the higher education sector challenging for the state. The strictly regulated national side of the higher education systems is often directed in a more top-down fashion, and the administrators of higher education institutions work under this framework like "public servants." At the same time, academic staff mostly work in the context of global science, where the implementation of narrow top-down policies is difficult and the role of academic profession as an object of loyalty is pronounced. This has created a strong contrast between administrative staff (who are loyal to their institution and its regulation by the state) and academic faculty (who are loyal to their profession and disciplinary network) working within the same institutions.

## Steering Forces of Higher Education

Over the years, there have been many attempts to develop useful steering system typologies to deal with the variation and complexity of national steering arrangements between different countries (Braun and Merrien 1999; Santiago et al. 2008). For example, in 1983, American sociologist Burton R. Clark published his seminal and widely cited book *The Higher Education System*, which can be considered as a turning point in the higher education literature. In his book, Clark introduced the now well-known "triangle of coordinating forces," which depicts how different forces influence the direction of higher education systems. According to Clark, three of the most important steering forces are state, markets, and academic oligarchy (i.e., the academic profession) and that the national higher education systems can be grouped into the following three "ideal types" according to the role that these forces play in steering the system.

1. *Systems strongly coordinated by the state* include systems which are mostly or totally publicly funded and within which higher education institutions operate as public agencies under the direct and strict influence of ministries or other government bureaus. Academic and administrative staff hold civil servant status, further underlining the strong link between the state and institutions. Coordination takes place through government plans, norms, and regulations as well as through financial incentives promoting government objectives (funding model).
2. *Systems strongly coordinated by the market* incorporate systems which are mostly privately funded and in which higher education institutions operate as independent legal entities. The government has only a supervisory role to play

in coordinating and monitoring the system, and the level of autonomy of higher education institutions is high. Market-based incentives and competition for prestige are the forces which primarily direct the behavior of the institutions.

3. *Systems strongly coordinated by the academic profession* are arrangements where the academic profession plays a central role in decision-making. In these systems, higher education institutions are insulated from direct political interference and market-based incentives and are guaranteed a high level of autonomy and public funding without significant accountability requirements. Individual areas of study enjoy high levels of academic freedom and professional autonomy. Universities as organizations act as "ivory towers" and gate keepers of academic profession.

Clark's model can be criticized as outdated and too simple for depicting the complex coordination of modern higher education systems. As such, the model assumes coordination forces to be mutually exclusive in the sense that it does not allow for multiple coordination forces to act in unison, such as the state together with the market (e.g., quasi-market mechanisms where the state is exercising some control, such as vouchers for students or companies). Another limitation for Clark's model is its inability to capture the multiplication of actors involved in higher education steering. For instance, some steering responsibilities of the "state" are delegated to intermediate bodies, such as research councils or quality assurance agencies. At the same time, "state" cannot be viewed as a unitary actor, but it is composed of multiple, even rivalrous policymakers, such as other levels of the public sector (regional and local) and administrative sectors (e.g., the Ministry of Economic Affairs or the Ministry of Labor) that have reinforced their roles in the steering process. Parallel to this, external stakeholders (industry, employer organizations, labor unions, etc.) are being increasingly included in coordination and steering processes both within and without state steering activities (Santiago et al. 2008). Nevertheless, Clark's triangle still has heuristic value, especially when it is combined with more recent and multidimensional models, frameworks, and approaches.

One way to supplement the triangle of coordination is to focus on important instruments of steering, not only the power bases of steering. The steering of higher education involves using agreed-upon policy instruments, particularly resource allocation, to promote greater coordination and rationalization, improved quality, efficiency, and results (Santiago et al. 2008). From this vantage point, it is not a surprise that two instruments in particular have gained importance in modern higher education systems, namely the quality assurance and funding models. Quality assurance – in the form of institutional quality systems, audits, accreditation, and other mechanisms – has started to play an increasingly important role in the steering of higher education toward "massification." Auditing and quality assurance have been observed, especially in Western countries, in all fields of public administration and services, as accurately described by Michael Power in his book, *The Audit Society*: *Rituals of Verification* (1999). The role of audits has been increasing in both education and research. However, in higher education, especially in Europe, the increased role of quality assurance has not been only caused by the changes in national steering and funding; they are also related to the new structures of multilevel governance. In Europe, the Bologna process has aimed to ensure comparability in the standards and quality of higher education and has played a very important role in the restructuring of higher education. This development can also be seen now on other continents. For instance, in Africa, the European Union is supporting a Tuning Initiative that is focused on the harmonization of educational structures and quality assurance.

One of the most well-known models for classifying the funding mechanisms of higher education systems was developed by the Dutch researcher Ben Jongbloed. In his paper "Funding higher education: options, trade-offs and dilemmas" (2004), Jongbloed categorized higher education funding models according to two questions: (1) "What is funded by the government?"

**Higher Education Governance and Reforms, Fig. 1** Trends in funding models (Jongbloed 2004)

and (2) "How is it funded?" The first question concerns the funding base for the government allocations to higher education institutions (inputs or outcomes), whereas the second question relates to the degree of market orientation in funding arrangements (centralized regulation vs. decentralized market competition; see Fig. 1).

Using these two dimensions, the development of funding practices can be divided into four categories (quadrants Q1, Q2, Q3, and Q4) to classify types of funding arrangements:

The first of these (Q1) represents a centralized system of funding. It is a more traditional type of budgeting, where allocations are based on budget requests (activity plans, etc.) submitted to the budgetary authorities and then decided upon through negotiations. The budget allocation is often based on the previous year's allocation of specific budget items like staff salaries, material requirements, building maintenance costs, and investments – that is, inputs – for production processes. The second (Q2) dimension covers all systems where performance-based funding plays a central role. Performance-based funding rewards higher education institutions on the basis of what they have produced – i.e., outputs. Performance-based funding for teaching is often based on graduate-related criteria (degrees and study credits) and research-based criteria, for which indicators related to publications, external research funding, or results of the peer-review process are normally taken into account.

The third dimension (Q3) covers models which combine output and market orientation. In these models, higher education institutions are invited to submit tenders for a given supply of graduates or research activities, and they are encouraged to compete with one another to provide education, training, and research to meet national needs. Also, allocation of competitive research funds through national research councils and other financiers can be fitted into this category. However, funding arrangements which are based on user-driven allocations such as vouchers (student vouchers and knowledge/innovation vouchers for companies and other organizations) can be considered the most decentralized form of funding systems (Q4). This is because it is "consumer" demand that drives the system, and higher education institutions have to maintain the quality of their teaching and research what courses they should offer because unattractive programs and services will not receive sufficient funding. The voucher system can be combined with a system of tuition fees, where the voucher only partly covers the cost of tuition.

The general trend in funding models across the globe suggests that governments are moving away from historical and negotiated line-item budgets and replacing them at least partly with

performance-based funding arrangements and competitive funding mechanisms. Often these approaches are accompanied by study fees and other "user-pay" type of arrangements. The extent to which this trend is realized still varies greatly across countries, but it represents a gradual shift from centralized regulation to more decentralized, performance-driven, and multi-dimensional steering practices.

## Higher Education Reforms: Overall Characteristics

Higher education reforms are commonly associated with changes in the balance between the main sources of steering outlined previously (i.e., the state, markets, and academic profession). The content of reform typically includes reforming legislation and other regulations as well as modification of the funding model. However, more recently, this content has also included revision of quality-related polices and mechanisms that are more or less comparable to "information steering" (for steering by norms, finance, and information, see Vedung 1998). The reforms can be approached from two perspectives. On the one hand, reforms can be studied from the historical perspective and linked to the changes and development trends in public administration as well as its goals and values (i.e., Greve 2015). On the other hand, reforms can be studied from the perspective of the mechanisms and activities conducted during the reforms (i.e., Pollitt and Bouckaert 2004). In the following paragraphs, the overall picture of higher education reforms in the Western world is described from a historical perspective.

The changes and reforms of higher education systems and their role as a government instrument run parallel to general development and reforms in public administration. Reforms of public administration can be divided into four distinctive phases: (1) legalistic public administration (until the 1940s), (2) welfare and planning (1950–1980s), and (3) new public management (1990s onwards). The future of the managerial paradigm is still unclear, but several attempts have been made to define the next "big thing" (see reviews by Greve 2015 and Bryson et al. 2014).

Legalistic public administration, or traditional bureaucracy-oriented public administration, provided a good foundation for academicians to build upon. During the era of development of modern nation states (late nineteenth century), higher education played an important role in building up the national identity (language, history, and religion), legislation, administration, and military as well as agriculture, the economy, and other important sectors of society, by educating civil servants, priests, and other members of the elite. In addition, higher education was used to nationalize the elite of the society by providing an alternative (degree) to inherited social status (estate) in legitimizing societal positions (Brante 2010). It was typically regulated and came with societal privileges. The state primarily provided the authorization and status that enabled higher education to operate and influence the academic profession (as part of the elite), thereby steering the system.

After the Second World War, the societal role of the public administration changed considerably. The legalistic orientation of the administration was amended with welfare and planning-oriented approaches. Public administration was given several new tasks, especially regarding public service provision, including social services, healthcare, and education. As a part of this transition, higher education systems were also reformed in many countries to meet the new demands of the growing and developing welfare states. This meant (among other things) the training of new welfare and technical professionals (see, for example, Elliot 1972 and Etzioni 1969), massification of higher education (see Trow 1974), politicization of higher education (see Ben-David 1977), diversification of the tasks/missions of university (see Kerr 1963), and professionalization of the management of the universities (see Clark 1983). Over a 40-year period after the Second World War, higher education was transformed from small elite sector that had enjoyed considerable autonomy and independence to a sector considered to be important for social mobility and regional equality as well as serving as a foundation for the systematic

development of societies, services, and national economies.

New public management was introduced as a development doctrine for the public administration in many countries in the 1980s and 1990s. The change in the ideological atmosphere was also evident in higher education policy and the implementation of higher education reforms. At the same time, the size of the higher education systems was still expanding. In general, higher education policies were directed to gain more "value for money," that is, economy, efficiency, and effectiveness. Greater accountability demands were supplemented with a higher emphasis on "excellence." In line with these changes, government policy interests with respect to the mission of higher education shifted from education towards research and societal services. The outcome of this development has been that higher education sector is considered to be one of the most important factors in the increase in wealth and competitiveness of a society. This has meant developments in the interaction between higher education institutions and society. These developments include, but are not limited to, changes in the knowledge production processes from discipline-based basic research to transdisciplinary and more applied research (Gibbons et al. 1994), changes in norms of science (e.g., Ziman 1994, 1996), the appearance of managerial fads in higher education (e.g., Birnbaum 2001), an increase in the role of international actors (especially the European Union and the Organisation for Cooperation and Economic Development [OECD]) in facilitating policy diffusion and transfer (e.g., Corbett 2011, and Kallo 2009), and a change in the role of government from regulative to supportive (Neave and Van Vught 1991). These changes have been predicted to lead to a higher emphasis on the entrepreneurial activities of universities (Clark 1998); intensification of university, industry, and governance linkages (Etzkowitz and Leydesdorff 1998); universities' more crucial role in innovation systems (Lundvall 1992), a disconnection of nation states and their universities (Readings 1996), an emphasis of quasi-markets and external funding for science (Slaughter and Leslie 1998), and an increasing role of stakeholders (Burrows 1999).

Like other sectors of society, higher education is required to be more efficient, more effective, and more economical than before. Government structures have been reformed to increase accountability (and autonomy at same time), efficiency, and relevance as well as the economic capacity of the nation (Teichler 2000; Henkel 2000). In Table 1, a typology of the main characteristics of higher education reforms in Western countries (especially continental Europe) is described.

## Internal Governance

There is a wide consensus that universities are distinctive organizations. However, there are only a few characteristics that are broadly accepted, and thus often cited, as indicative of

**Higher Education Governance and Reforms, Table 1** Characteristics of higher education reforms

| | Pubic administration ethos | Policy goals | Steering priority | Funding model | University organizations |
|---|---|---|---|---|---|
| Up to the 1940s | Bureaucratic (legalistic) | Legitimatization of the elite, national identity | Profession, state, markets | – | Autonomous, professional |
| 1950s to 1980s | Professional (welfare) | Equity, democracy, planned welfare society | State, profession, markets | Negotiated, incremental line-item budgets | State funded/ regulated, professional |
| 1990s to the present | Competitive (market) | Accountability, innovation capacity, research excellence, economic growth | Markets, state, profession | Performance, contractual, and demand-driven model | State subsidized, professional |

universities as organizations. These organizational characteristics are good starting points for analyzing university governance at large. Universities as organizations (public or private) are considered to be:

- Matrix organizations (i.e., Galbraith 1971; Sayles 1976)
- Loosely coupled organizations (see Weick 1976)
- Bottom-heavy professional bureaucracies (see Mintzberg 1983)
- Boundedly rational organizations (see Simon 1957; Williamson 1975)

These features, which are typical of any organization formed for the coordination of autonomous professional work, have been transferred to and popularized in the field of higher education research by the previously mentioned book, *The Higher Education Systems* (Clark 1983) and Robert Birnbaum's *How Colleges Work* (1988). In the university context, the matrix structure refers to the institutional and disciplinary dimensions of both universities and higher education systems, where the crossing cells are basic units belonging simultaneously to both the institution and the scientific discipline. Both dimensions are highly specialized: basic units to subject matters and the central administration of the institution to administrative unity. Because of the matrix structure, the faculty has two reference groups to which they owe loyalties: their disciplinary community inside and outside their basic units and their university in the form of the central administration. Sometimes these loyalties may be in conflict with each other, and in these situations it has been suggested that it is the discipline rather than the institution that tends to become the dominant force in determining priorities (Clark 1983).

The term "loose coupling" refers to connections between organizational subsystems that may be infrequent, circumscribed, weak in their mutual effects, unimportant, or slow to respond (Birnbaum 1988; Weick 1976). The loosely coupled nature of academic organizations has been viewed as strong independency and autonomy of the organizational units based on disciplinary departmentalization. In fact, the roots of loose coupling can be found in the content diversity of academic work itself. Due to these differences, academic basic units, such as departments and faculties, may live their private lives under the same institutional label but with very few mutual ties or little need for cooperation. In fact, the connections of basic units to their external stakeholders may be even tighter than their relationship to other basic units of the same institution (Hölttä 1995; Kivistö 2007).

The role of the academic profession has been highlighted as the "academic heartland" of a university organization (Clark 1998). The irrationality or anarchy within universities has been also emphasized when discussing on decision-making, management, and planning in universities. The commitment of academic workers is often bent towards the disciplinary dimension, not to the organizational one. At the same time, management and decision-making in academic units is rooted on ad hoc structures, collegial bodies, rotating managerial positions, and random discussions.

Universities' internal governance structures have been subjected to changes in the overall policy environment and administrative reforms. Thus, there have been many attempts to theorize different aspects of changes and continuities in university governance and management. By proposing a heuristic typology of university governance, Farnham (1999) has made one of the best attempts at this. His typology is based on the academic professions' role in decision-making and professional autonomy in universities (Fig. 2). These heuristic models – collegial, bureaucratic, managerial, and entrepreneurial – can be chronologically linked to the administrative reforms mentioned earlier (see Table 2).

The most traditional model of administration and management in universities, the "collegial model," is based on high autonomy and participation of academics in decision-making. This model can be related to the time before the Second World War when the most of the universities were small, elite institutions. The collegial model is based on the equality of the full members of academia; there is no power hierarchy, only individual

**Higher Education Governance and Reforms, Fig. 2** Model of university management (Farnham 1999)

**Higher Education Governance and Reforms, Table 2** Characteristics of higher education governance models

| | Management model | Decision-making structure | Role of academic profession |
|---|---|---|---|
| Up to the 1950s | Collegial | Consensus by professors | Autonomous and self-regulating |
| 1950 to 1980 | Bureaucratic | Democratic by administrators, students, professors, and other employees | Autonomous, but steered |
| 1990 to 2010 | Managerial | Strategic by professional managers | Autonomous, but measured and evaluated |

statuses, and decisions are made by applying a principle of consensus.

The "bureaucratic model," on the other hand, can be associated with the time after the Second World War and to the time of development of welfare states. In many countries, the universities were tightly connected to the state bureaucracy and policy goals defined by governments. The role and size of support services and administration (top-down implementation structures) grew, and the matrix dividing the institutional and disciplinary structures deepened. The decision-making was partly transferred from academics to the hands of funding bodies, governments, students, and administrators. However, the individual academics were still professionally autonomous and often, in public systems, their autonomy was supported by their civil servant status. The developments included expansion of new professional groups like student affairs; teaching and research services; the growing size and increasing complexity of the university organizations; establishing new, more democratic decision-making structures; and implementing new budgeting models to enable the steady growth of resources.

The "managerial model" is linked to the development of new public management and more market-oriented state administration. The managerial model highlights the importance of professional management, economic efficiency, new technologies, and controlled workforce, which in turn have led to diminishing professional autonomy and weaker possibilities to participate in decision-making. Managerial practices have been widely implemented in higher education for two reasons. First, in many countries, the public sector reforms have also impacted the higher education sector. Second, funding bodies, supranational policy authorities such as the OECD and other actors like consulting companies have supported policies for stronger managerial orientation which have, in some cases, turned into "management fads." The developments have included the introduction of CEO-type rectors who are responsible to the board, not to the university community: a stronger managerial role of deans and department heads (full-time

management positions); new performance-based management structures (salary systems, evaluation of individual performance, etc.); more strategic orientation in institutional decisions and profiles; and expansion of the role of external stakeholders and funding bodies in decision-making (external board members).

The discussion on the "entrepreneurial model" of university administration, which falls somewhere between the collegial and managerial models, has been ongoing already for two decades Clark (1998). However, so far there is no clear evidence that there would be strong empirical counterpart in the development of university governance towards the entrepreneurial ideal type. However, many of the managerial fads have been implemented in higher education under the bureaucratic and managerial management models. According to Birnbaum (2001), almost all major fads prevalent in business and public sector have been transferred to the higher education context, just with a minor delay.

## Conclusion: "Quo Vadis Higher Education?"

Greve (2015) proposes that three emerging management paradigms in public sector are identifiable based on the literature: collaborative governance (or new public governance), digital governance, and public value management (see Table 3). Collaborative governance holds that public sector organizations should collaborate with other actors in society to find efficient policy solutions, whereas digital-era governance proposes that collecting, storing, and utilizing the collection of Big Data change public administration and provide new possibilities to manage and develop public services. In turn, public value management provides insight that the main task of public (or non-for-profit) managers is to strategically define the value of service and that the value can be managed through performance measurement and dashboards. These trends can also be seen in the higher education literature.

Collaborative governance has been connected, in the higher education context, to the so-called third mission of the universities. Third mission has many names and includes many aspects. It is referring, for example, to public service function, social engagement, technology transfer, and innovation activities in universities. In short, it means nontraditional teaching and research activities done with and for external stakeholders. Because of the growing importance of third mission, the role of external stakeholders has been highlighted in higher education reforms and internal governance (Jongbloed et al. 2008).

**Higher Education Governance and Reforms, Table 3** Emerging management paradigms and the higher education sector

| | Collaborative governance | Digital-era governance | Public value management |
|---|---|---|---|
| System changes | Inclusion of third mission in the functions of universities, expanding the funding base | Emphasis on open-access publications, data archives and registers, steering towards digital services | Demand for strategic management and clear profiles of universities; emphasis on societal relevance and effectiveness<br>Performance measurement, ranking lists, and league tables |
| Internal governance | Increasing role of external stakeholders and customers in quality assurance, in administrative bodies and in research and teaching | New kind of control of work. Online feedback on teaching; distinction of product and academician (i.e., recorded lectures, online courses, etc.); immaterial property rights; control of research by citations and other bibliometric mechanisms | Managers managing and measuring effectiveness. Top management's (rector, vice chancellors) and middle management's (dean) strategic roles in working with stakeholders and funding agencies for legitimization and resource generation |

New digital solutions and the role of Big Data have become apparent in higher education teaching (i.e., massive open online courses) and research (open-access publishing and data archives) and in management of these activities (management information systems, institutional research, etc.). Because of the strong position of publishing houses and other companies providing digital services for higher education institutions, the governments have taken a more active role in steering the digital development in the sector.

Until recently, higher education has been in a position of growing budgets and funding and, at the same time, has had a monopoly in providing degrees (formal qualifications) and creating scientific knowledge. However, this situation is changing rapidly. Higher education institutions need to show their societal value as a justification for the resources they receive. This is causing practices that can be associated, although they have not been analyzed, with a public value management framework (Moore 1995). Practices can be observed, for example, as a strengthened emphasis on the strategic management, positioning, and profiling of higher education institutions. Developing performance management and measurement has been one of the main governmental interests in recent higher education policies throughout the world. This has gone hand-in-hand with the appearance and development of university ranking lists and league tables (U-Multirank, Academic Ranking of World Universities, QS World University Rankings, and Times Higher Education World University Rankings).

It is too early to say, what is the next major trend or a management paradigm in higher education. The market-oriented, managerial-type of administration is still going strong, and most of the governments and funding agencies have policies and instruments that support the managerial structure in higher education. However, some crucial changes in the development of higher education systems can be observed.

The size of higher education is still growing, and student numbers are increasing in most countries. However, there are signs that higher education's growth has reached its limits in some Western countries, especially in those that have already gone through the "massification" phase. It is still unclear what this will mean for higher education and higher education policy in the future. However, what can be said is that there are no signs that the importance of higher education is decreasing (even if it is not growing) for national knowledge economies now or in the near future. Thus, we can expect that governments are eager to fund and steer their higher education systems in the future. Subsequently, trends and emerging ideas in public sector management will, most likely, continue to also be evident in higher education institutions.

## Synonyms

Higher education governance and student participation; Students' involvement in higher education governance; Students' voice in university management

## Definition

Student participation in higher education governance refers investing students' labor and talents in the institution. It also indicates students' engagement in the decision-making process of higher education administration.

Student participation refers to what a student brings to higher education in terms of expectations, ambitions, values, and beliefs as well as how their experiences as a student shape and mediate these characteristics.

## Introduction

Research on student participation in higher education governance focuses on student involvement in the university administration. It includes students' physical as well as psychological attachment in the institution. Scholar attention to student participation is relatively recent, much of which has emerged in the last two to three decades. The notable definition has been provided by Planas et al. (2013); it argues participation is a dimension of "people's quality of life, closely related to processes of social inclusion and identity (p. 571)." It indicates that student participation in university governance upgrades students' life and it emphasizes that students are considered a vital part of society who can also play an important role through their participation. Besides, the Council of Europe highlights the significant role of higher education institutions in transmitting collective leadership, which also is called as democratic values (Planas et al. 2013). Seale (2009) also recognizes the student participation; authority needs to listen to students' voice actively regarding their education. Effective communication with the students and working partnership with the students empower "students to be actively involved in the development of their education." Considering students' suggestions and views increase their trust and satisfaction toward the university (Li and Zhao 2018).

Students have several kinds of participation in higher education levels, which includes student participation in extracurricular activities, higher education administration, dormitories, departments, faculty, student organizations, and student unions/councils. Beyond this, students also participate at the national and policy level and in politics and social work. Extensive varying terminology of "participation" has emerged in recent years. It varies in different kinds of literature, and it has also overlapped with the connected concepts of "involvement," "engagement," and "participation." Anyhow, students are considered as one of the essential stakeholders of higher education. As a stakeholder, they have participated in higher education institutions. Above all, student participation is the combination of "engagement" and "involvement" where students can show several different types of academic activities besides their regular study. It includes attending meetings with the university administration to contribute their role, participating in curriculum design and developments, making efforts to improve the university's learning environment, and taking part in knowledge creation that students can add to the learning and teaching with the faculties. These matters imply that student participation is one kind of shared and distributed leadership where students and academic staff contribute

together in higher education institutions (Mafa 2016).

## Conceptual Framework

Higher education governance refers to managing and organizing the higher education institutions. It is a combination of three main pillars of higher education: students, faculties, and staff. In the Bologna process and the Prague declaration, students are considered as key stakeholders of higher education institutions (Mafa 2016; Prague Declaration 2001). Higher education governance is also considered as a complex networking among its above-mentioned stakeholders based on the legislative frameworks. The "complex networking" illustrates that higher education administration has several functions. For instance, the functions include planning, organizing, directing, coordinating, controlling, and evaluating. It is challenging to accommodate the whole functions smoothly. Amadi (2008) argued education governance as "the process of bringing people and materials together for effective and functional teaching and learning in the school." Its main aim is to enhance teaching and learning. Besides, higher education governance is seen as providing direction as well as prioritizing the way of achieving fixed goals. The higher education institutions may have many goals and objectives to attain as well as the state whose principal purpose is to enhance teaching and learning.

In the initial stage of the establishment of the world's oldest universities, students were the key players in the setting up of universities and the pay of their teaching staff as a dominant force in managing institutions. Later, student lost their dominating power, and the decision-making authority in universities has been delegated to administrators and the faculty. In the 1700s, 1800s, and 1900s, students were dissatisfied because they lacked influence and control over their decisions. During this time, they had less freedom and more rules and restrictions. The administration and faculty of higher education kept a close eye on every aspect of students' lives (May 2010). The university administrators believed that students would remain obedient, and they were not to be given equal power as the faculty or even other citizens. These dissatisfactions prompted students in Latin American universities to stage a violent protest in the late 1700s and early 1800s (Klemenčič 2012). As a result, a major change in university administration regarding student engagement in Western Europe, North America, and Commonwealth countries was accomplished. The universities included new provisions on student engagement in administration. A study by De Boer and Stensaker (2007) mentioned that critical changes were made in Germany among the European countries. Germany introduced a tripartite model of university administration with the professoriate, nonprofessional academics, and students. Students represent equal participation in most institutional decision-making bodies. Accordingly, other countries introduced a shared leadership model in most of the higher educational institutions. At present, it has been considered internationally as a key policy issue for higher educational institutions.

Various scholars articulated student participation in a variety of ways. Coates (2007) pointed out that student engagement intends to encompass salient academic and certain nonacademic aspects of the student experience in educational setting. RAISE (2010) maintained that student engagement is constructed and reconstructed through the lenses of perceptions and identities held by students. Coate's (2007) views on student participation comprises the following characters: active and collaborative learning; formative communication with academic staff; participation in challenging academic activities; involvement in enriching educational experiences; and feeling legitimated and supported by university learning communities. This definition has been broadened to include academic and social integration, student learning, student happiness, student representation, student interaction, performance, extracurricular activities, collaborative learning, feedback, and so on.

It notes that students need to take permission from the university to find out where they can engage and where they cannot. Many of the higher educational institutions in industrialized countries

have stable guidelines regarding student engagement in university governance. Acknowledging these issues that empower relations between university students and academic staff are challenging as well as unequal (Robinson 2012). Mann (2008) supported this statement and reported that if anybody wants to understand the student experience, he/she has to know the university power dynamics.

On the other hand, some academics see the student participation in higher education governance from a consumerist view point. Students are considered as clients, consumers, co-producers, and users of higher education, where universities act as service providers. Several industrial countries, for instance, the USA, UK, Canada, Australia, and some others, believe in commodification of education wherein students are viewed as products, clients, or customers (Guilbault 2018). It is considered that higher education is a well-established business, and higher education is putting an advertisement to collect students and also branding their products (Hemsley-Brown and Oplatka 2006). However, one study (Guilbault 2010) disagreed with the previous views by quoting a professor, "*my student is not my customer*." Therefore, in another aspect, many countries do not see education as a business and students as products, while they consider it a service (Ostrom et al. 2011). This statement is justified by the president of the UK National Union of Students in 2008 when he warned about the dangers of consumerism. He argued that if university administration treats students as customers it will put the relationship between students and academics on the wrong footing – it should be a partnership between the student and professional member of staff rather than a customer relationship; otherwise, it will distort the relationship and create a "customer is always right" mentality (cited in Carey 2013).

From that perspective, students are not to be treated as customers or clients. They are the partners of higher educational institutions (Sutherland and Lenihan-Ikin 2019) wherein students are the junior scholars, and academic staff stand as senior scholars. Students would actively participate in universities through representatives or other sophisticated ways. Students will seek the interest of higher educational institutions and contribute to enhancing the image of the institution, but students may not do it as customers' attitudes. They will do it to respect the higher educational institutions.

Higher education has a variety of formal and informal frameworks for the involvement of students in governance. To begin with, student feedback is an important mechanism to participate in governance, most of the cases it happens through student councils or committees. Besides, students participate in governance through raising student voice (Lizzo and Wilson 2009). In this regard, most universities require formal student participation on the university-level committees (e.g., academic senate and disciplinary committees) to ensure proper representation of constituencies. On the academic level, students are invited to join the staff of a school or departmental committee as full members. Organized student representation in different levels of higher education institutions is useful to solve many problems at the local level. However, different higher education institutions have different guidelines how students participate in the university governance.

There are some areas of student participation in higher education governance. It comprises participation in teaching, learning, and research; participation in student affairs; and participation in institutional finance, policy, and strategy (Luescher-Mamashela 2013). Participation in teaching, learning, and research through student representation depends on the level and background of university administration, such as course, program, department/school, faculty, and university-wide academic policy. It also varies on the nature of issues, for example, timetable setting, student assessment, academic recruitment, quality assurance, and faculty awards. Participation of student affairs includes extra-curricular affairs of students such as leisure, student residences, health and sports, and so forth. Students can directly participate if they are interested and make an impact on other members of the community. And students can also participate in institutional finance, policy, and strategy. It is relatively

difficult to participate in this level due to lack of competence and impermanence among students.

## Trends of Students' Participation

European countries are at the forefront in terms of student participation in higher education governance. It is an old phenomenon. For instance, in the renaissance period, students had much power over the higher educational institutions, including hire and fire the university staff. It has been shirking the students' dominance over the time. But still, the students have the opportunity to play a significant role in the higher education decision-making process. Student participation is considered one of the foundation values in European higher education. In this aspect, the Bologna process plays a key role; it recognized students as key stakeholders. The Prague Communiqué also declared that students are to be considered full members of higher education committee (Prague Declaration 2001).

Most of the European countries follow Bologna process. In particular, in the UK, students are represented in higher education institutions at the national, institutional, and course level. National representation is frequently coordinated with the National Union of Students, whose functions are more political and less local. At the institutional level, the university's Student Union plays an important role. In the UK, by law, Student Unions are independent of their parent universities (Little et al. 2009), and their elected students advocate for that university's students. And finally, for representation at the course level, students individually referred to course representatives. In the USA, student associations practice with full power within an administrative framework. A study by Trowler (2010) revealed that the US university students enjoy more freedom compared with other countries. It has been broadly accepted that student participation in the administration was introduced in the 1970s. In the USA, 77% of university boards include students, and students comprise almost 10% of each university board (Zuo and Ratsoy 1999). In Canada, decision-making processes at universities are more open and transparent, allowing more faculty and student participation. Students comprised 78% of Canadian university boards (Jones et al. 2010).

In the developing countries, students have a participation in the higher education governance but it does not come under any set of rules. Besides, student participation does not get any recognition from the university. For instance, students have participation at the residential dormitories, they look after the seating arrangement of the university dormitory, and they also supervise the dormitory canteen. Students also meet with the university administration at different times to make different demands. If it does not work, students assemble on the streets to demonstrate in favor of their demands.

## Benefits and Challenges of Student Participation

In recent years, studies have been carried out that highlight the significance and relevance of student participation in higher education governance (e.g., Haines 2019). It also displays some commonalities in different countries. A survey indicates the student participation is close to universal but has some considerable variability between and within institutions (Little et al. 2009). The various studies demonstrate the rationality of student participation in university governance. A research argues that participation is a dimension of people's quality of life, closely related to processes of social inclusion and identity (Planas et al. 2013). It indicates that student participation in university governance upgrades people's life and it points out that a student considers himself as a vital part of society who can also play an important role through their participation.

Studies have elucidated several arguments of student participation in the university administration (Haines 2019). Students are directly affected by the decision of the university administration, and the governing body takes the all decisions. In addition to this, the Council of Europe highlights the significant role of higher education institutions in transmitting collective leadership, which is also

called democratic values (Planas et al. 2013). Besides, scholars stress that the value of student engagement is no longer questioned (Trowler and Trowler 2010). It is also recognizing the student participation, authority needs to listen to student voice actively regarding their education (Seale 2009). Effective communication with the students and working partnership with the students empower them to be actively involved in the development of their education. Considering students' suggestions and views increase their trust and satisfaction toward the university (Li and Zhao 2018).

There are two lines of counter arguments regarding student participation in university administration. The study highlights the several positive benefits of student participation in university which has a direct impact on students (Menon 2003). The participation of students in higher educational institutions is the preparation of students for their democratic ideals and practices (Boland 2005). Students would learn the democratic socializations and it contributes to the personal growth and development of individuals. The thing about democracy is that if students get a good idea about democracy and start its practice from the beginning of their life, it would impact their future activities. And through this, the individual as well as the family, society, the state all benefit. Because students are more in number in a community, they will lead the country in the future. Besides, student feedback can facilitate the assessment of curricula and teaching practices by identifying gaps in higher education programs and instruction (Menon 2005). Moreover, involvement of students in decision-making plays a significant role in fostering an environment of transparency and trust in universities that leads to a positive organization (Mafa 2016). It can be expected that a positive climate will reduce the possibility of confrontation between the board and students or the board and staff. Through this process, when students realize that they are part of higher education institutions and universities evaluate students' voices positively, students consider the educational institution as their own. Thus, the students consider this institution's good and bad aspects, and students try to increase the institutions' image. Furthermore, student participation promotes distributed leaderships model, which help to build a relationship between students and university administration (Menon 2003).

Student participation has been shown to have a positive impact on educational gains and academic achievement and retention. Students are the important stakeholders of the higher education institutions; they are the key factors, and the principal educators in the process of higher education. Likewise, many countries have measured student outcomes through student participation in the university decision-making process, and stated that student engagement can act as a proxy of quality. Thus, many higher educational institutions are encouraging in providing spaces for the students' participation in the university administrations in different capacities (Mafa 2016). It is also proved that students are able to manage their own affairs, meet the needs of different students, and protect the political interests of students (Zuo and Ratsoy 1999).

However, some educational studies bring several arguments to not include students in the higher education management (see, e.g., Menon 2003; Wood 1993). For example, students are not in a position to participate in any policy-level meetings due to their age and experience (Zuo and Ratsoy 1999). Age is an important issue in many cases, especially in formulating policies. Formulating a policy is a complex issue. Besides, the higher education policy level deals with several complex problems where students might not contribute efficiently. Further, students are considered as "transient members," they come at the higher education institutions for a limited time and they have short time interest and visions of institutional development. Moreover, students in all higher education institutions are not equally capable of influencing university decisions (Acharya 2015). Moreover, a number of reasons for the exclusion of the student participation in university administration have been frequently explored (Zuo and Ratsoy 1999; Wood 1993). According to the study (1993), students may not represent effectively to promote the interests of the student community. Their participation in

university can lead to conflict of interest among the students. Just as students may have various demands, they also have different factions. As a result, students cannot present their needs to the higher education's administrations considering their predominance. The literature also shows that students may not have sufficient knowledge and experience to participate in such kinds of board where the authority takes important decisions and formulates policies. Some studies also argue that students could participate in decision-making process of higher education institutions but they should have limited involvement (Menon 2003; Zuo and Ratsoy 1999). Students may also lack interest to participate in such activities in the university as their participation could also affect their academic performances. Besides, students have a time constraint to participate in different policy-level programs due to their academic activities. Some policy-level meetings have some agendas on student grading and faculty performance and promotion where student representatives should be excluded. The issues are usually accepted by the academicians of students' inadequate knowledge to participate in the university's decision-making process. Also, it will lead to psychological conflict between students and the academic staff (Menon 2003). Many academic staff often do not feel comfortable working with students outside the classroom. The classroom has a different teaching environment, and other places do not have that atmosphere where students and academics feel comfortable.

## Conclusion

From the above discussion it could be said that student participation in the higher education institutions is considered as a substantial component of success in higher educational institutions. It has received extensive discussion in the last few decades. Though there are distinctions in student participation among different regions and different institutions, it has several positive aspects, through which the learning institution benefits and at the same time both the student and teachers benefit. Students' participation also ensures positive organization climate of higher education institutions, which creates trust and respect among the students, teachers, and administrators. Besides, it is also seen that when students engage in university activities, student perform academically well, and they are also in a better position psychologically. Moreover, engaging students in university increases their skill and other qualities. Especially students learn how to deal with the university administrators, which would be benefitted by the students in future. However, there is a lot of controversy over this issue, whether it is good or bad. It can be said that student participation in higher education governance brings out positive outcomes for the higher education institutions. Even after this, the debate on this issue will continue, the future will tell us what it will be like.

# High-Performance Work Teams and Organizations

Francesca Flood[1] and Michael Klausner[2]
[1]Hope Verdad, LLC, Lake Frederick, VA, USA
[2]University of Pittsburgh Bradford, Bradford, PA, USA

## Synonyms

Excellent collaborators; High performing groups

## Definitions

| | |
|---|---|
| Organizational Climate | The collective personality, values, and ethos that create the internal and external image of the organization (Rao and Bullayya 2017). |
| Values | Defined in behavioral terms they describe how team members should behave in pursuit of team goals (Edmonds 2010). |

## Introduction

Although public and private sector organizations differ in a variety of ways, there are strong similarities in key values such as: accountability, expertise, reliability, efficiency, and effectiveness (Van der Wal et al. 2008). In some areas, public

and private sector organizations may compete and must rely on organizational and team performance (Rao and Bullayya 2017). According to the Blanchard Institute (2014), there are five common elements in both the public and private sector. These include: communication, cultivating creativity, removing obstacles, support, and providing resources, contributing to high-performance work teams and organizations.

High-performance organizations delineate themselves through sustainable growth, market leadership, employee retention, and producing value to stakeholders (Blanchard Institute 2014). These organizations identify changes in their industry landscape and undergo transformation to stay relevant (Cancialosi 2015). Specific characteristics such as: organizational climate and human resource management have been identified as integral to the success of these organizations (Anderson and Caldwell 2018; Rao and Bullayya 2017).

Fostering high-performance teams who thrive in these environments requires subset features that cultivate such teams. Such features include: clearly defined goals, alignment of values, communication, collaboration, autonomy and authority, and effective leadership (Abdallah and Ahluwalia 2013; Blanchard Institute 2014).

## High-Performance Organizations

Radical changes in technology, globalization, and the changing generation of workforce have caused organizations to undergo major transformation in structure, policy, procedure, market response, and value alignment with all stakeholders (Blanchard Institute 2014). A high-performance organization (HPO) is only sustainable when it can sense shifts in the market, adapt, respond, and seize opportunities to remain relevant (Powell and Felin 2016).

### Culture-Climate

Organizational/agency culture drives the behavior and performance of the group (Cancialosi 2015; Rao and Bullayya 2017). Climate develops through shared values and formal/informal group and individual behaviors, whether sanctioned or not (Gupta 2009). Cultures are distinguishable by the sum of attitudes, customs, roles, norms, values, and beliefs (Flood 2017). To achieve long-term and sustained growth, high-performance agencies have shifted from top-down authority to a polyarchy workforce, where authority is widely distributed, autonomy is encouraged, and social proofing fosters peer alignment (DeWaal 2007; Powell and Felin 2016).

Communicating goals, transparency, and building trust throughout the agency create an environment where all stakeholders feel safe to provide feedback, make recommendations, and commit to action (Cancialosi 2015). When the culture of an organization inculcates commitment and trust, accurately measures performance, and embraces esprit de corps, it may outperform others (Anderson and Caldwell 2018).

According to a recent Gallup study surveying more than 30,000 team members (Abdallah and Ahluwalia 2013), quality leadership, communication, effective performance management systems, customer centric focus, and training were identified as vital to an HPO culture.

### Human Resource Management

To create and sustain an HPO, human resource management plays an integral role through hiring practices and establishing policy, procedure, and programs that foster employee commitment, retention, and empowerment (Anderson and Caldwell 2018; Rao and Bullayya 2017). When training, compensation, performance measurements, and clearly defined goals are aligned to administrative practices that reinforce the larger objectives of the agency, high performance can emerge.

Cooperative behavior between the organization and its stakeholders is maximized when core values and strategic priorities are aligned. According to Bundy et al. (2018), a *fit* between the two dimensions of value and priorities increases trust, predictability between the parties, exchange of ideas, and heightened communication.

## High-Performance Work Teams

Teams are a ubiquitous feature of virtually all work organizations regardless of the entities'

nature or mission. Unlike a group which is comprised of individuals who act independently of others, teams function cohesively, utilizing complementary skills, holding mutual accountability, and focusing on a common goal (Cancialosi 2015; Katzenback 1996; Katzenback and Smith 2005). To a large degree, the success and/or failure of an organization is dependent on the quality of its people and their performance as a team. Certain subset factors must be present in high-performance work teams (HPWTs). Such factors include: clearly defined goals, alignment of values, communication, collaboration, autonomy and authority, effective leadership, and support (Abdallah and Ahluwalia 2013; Powell and Felin 2016).

### Clearly Defined Goals

Goal clarity is one of the most important features of high-performance teams. Indeed, it has been cited as *the* most pivotal feature (Sidebottom 2017). This requires that team members understand their goals and tasks in relation to broader goals (Anderson and Caldwell 2018). Without goal clarity, measuring and rewarding performance would be difficult (Larson and LeFasto 1989). Goals must be specific, meaningful, challenging, realistic, and measurable to assess if targets are being met.

Meaningful goals refer to the degree they are relevant to the organization's larger mission and the impact achievement might have on society. As an example, Richard Feynman, one of the physicists on the Manhattan Project that was charged with developing the first atomic bomb (1942–1946) indicated that his team behaved differently when members became aware of its purpose. When they learned that successful completion could result in defeating the enemy, a "complete transformation" occurred. The pace, quality, and quantity of their work improved given the stakes of their work (Goleman: 1998, p. 228). When HPWTs recognize the implications of their work are beyond the boundaries of the organization, a deeper sense of purpose and mission can be built (Fisher and Thomas 1996).

Goal specificity has the advantage of timely feedback, enabling the team to gauge progress and make necessary corrections. Another benefit of shared goals is reduced interpersonal conflict, having members focus on goal attainment rather than on internal squabbling. The best teams come together in a shared commitment, operating in a collective performance (Katzenback and Smith 2005). Team cohesion forms when there is a shared mission statement, purpose, and understanding of how work performance contributes to the success of the organization (Fisher and Thomas 1996).

### Alignment of Values

Organizations may create grandiose mission and purpose statements that, while noble, are not clearly understood by employees and more specifically, what they can do to accomplish them. According to Edmonds (2010), there are three integrated steps required for a values-aligned culture: clear performance expectations, define value in behavioral terms, and accountability of leadership and staff. "Values defined in behavioral terms describe how team members should behave as they pursue their team goals" (Edmonds 2010, p. 3).

Clearly defined roles are aligned to performance expectations. If team members do not have a clear understanding of their role within the team, feelings of uncertainty, frustration, anxiety, and conflict may develop. Conversely, when members understand what is expected of them individually and as a collective part of the team, the concept that no one individual is as strong as the team develops (Fisher and Thomas 1996). HPWTs integrate the individual and collective team knowledge for a common purpose (Cancialosi 2015). When the economic imperatives of the organization are tied to value-based priorities, high-performance teams emerge (Anderson and Caldwell 2018). Behaviors, such as integrity, commitment to service, and dedication are seen and experienced rather than viewed as abstract concepts (Edmonds 2010).

### Communication

Good communication serves two essential roles: disseminating the information employees need to do their job and creating relationships

between team members (Doyle 2018). High-performance teams require access to data through information technology structure, hearing from leadership, and transparency in the workplace. If the agency is on fire, that is in trouble, knowledgeable employees can be recruited to help put out the flames (Anderson and Caldwell 2018).

Open, honest, shared, and nondefensive communication are vital to individual and team performance. Such features inspire trust, which is essential to competing in today's world (Anderson and Caldwell 2018). Lack of shared information and easy access are major roadblocks to effective teamwork (Fisher and Thomas 1996). In addition to technical skills, HPWTs utilize effective communication characterized by interpersonal skills, honesty, assertiveness, confidence, listening, empathy, respect, and open-mindedness (Doyle 2018; Nelson and Quick 1997).

HPWT members exhibit effective persuasion skills, using logic and empirical data to support their views. Additionally, team members must possess empathic skills and able to read the emotional states of others (Doyle 2018). Empathic understanding provides an astute sense of what is important to other members, conveying an understanding of their position (Conger 1998). Persuasive skills are a key factor that differentiate HPWTs from average ones, pulling team members together to advance ideas, galvanize action, and develop constructive solutions (Goleman 1998).

### Collaboration

According to Guzzo and Salas (1999, p. 3), "Task-required interdependence is an essential element of teams." Effective teamwork requires ongoing interaction, exchanging information, sharing resources, assisting with workloads, and maintaining mutual accountability. Such activity inculcates a trusting environment that encourages growth and development (Abdallah and Ahluwalia 2013).

In a collaborative environment, the goal has been internalized by team members as the personal goal of each person (Larson and Fasto 1989). Trust conveyed through communication generates collaboration versus competition. Collaboration between team members fosters problem solving where efforts are synergistic, successively building on presented ideas. When HPWTs collaborate, the sum of the efforts exceeds the sum of individual contribution (Maznevski 1995).

A team's performance is the combined outcome of contributions from members who have the requisite skill set plus positive socio-emotional factors such as morale, open communication, and commitment, resulting in team chemistry that facilitates goal attainment. When the socio-emotional factors are positive the "...results can be more than simply additive – they can be multiplicative with the best talents of one person catalyzing the best of another, to produce results far beyond what any one person could have done" (Goleman 1998, p. 205).

A collaborative climate is produced from a high degree of psychological intimacy among members, involving feelings of "affection, warmth, unconditional positive regard, opportunities for emotional expression, and emotional support" (Nelson and Quick 1997, p. 265).

Mutual accountability is an essential feature of collaboration and occurs when team members believe that everyone on the team bears responsibility for the team's performance. (Katzenback and Smith 2005). Such mutual accountability must be deeply felt by the team for a team to exist. Members can self-police and are not dependent on outside influence to motivate them. They hold themselves accountable individually and collectively to the overall result.

### Autonomy and Authority

Market dynamics have forced agencies to rethink organizational structure. Hierarchical style management has given way to disbursed empowerment (Cancialosi 2015). Authority is no longer exclusively seated at the top tier of the organization, but rather imbued as a polyarchy. Here, employees who are closer to fast moving developments in market conditions are enabled to rapidly respond (Powell and Felin 2016). Such flexibility enables organizations to adapt to changes quickly and compete in cycle time, delivery, and sustainability (DeWaal 2007).

The rapidity of changes in technology, social media, customer preferences, and product development requires individual specialists and response teams to have true autonomy to address issues and leverage opportunities (Powell and Felin 2016). Although leadership in many agencies would like to retain authority while paying lip service to autonomy and polyarchy, high-performance teams will not thrive without alignment between action and words.

While disbursed autonomy and authority are vital to high-performance teams, without adequate, formal structure, such organizational construct could lead to chaos. To prevent this, organizations have incorporated social proof mechanisms such as the rule of three, where individual capabilities are bound by social influence that fosters harmonized and accepted behaviors (Powell and Felin 2016).

### Effective Leadership and Support

Effective leadership is a key element of HPWTs and has become less hierarchical, command-and-control oriented (Benett et al. 2013). Teams perform better than their peers, when leaders loosen the reins, demonstrate competence and knowledge, and possess interpersonal skills (Anderson and Caldwell 2018). When leaders demonstrate their confidence in a team's ability through autonomy and empowerment, staff flourish (Larson and LaFasto 1989).

Effective leaders cultivate leadership qualities in others by providing each member of the team an opportunity to lead in an area of his/her expertise (Katzenback and Smith 2005). Leaders that encourage the team to engage in self-observation, self-evaluation, and self-reinforcement were found to be characteristic of HPWT leaders (Manz and Sims 1987).

When leaders acknowledge the value of the team's contribution and convey the relationship between their performance and the mission of the larger organization, performance can be maximized (Fisher and Thomas 1996). Goleman (1998, p. 223) posited that the relationship between emotional intelligence and leadership harmonizes when, "…the best team leaders are able to get everyone to buy into a common sense of mission, goals and agenda…it may be the single most important contribution of a good leader."

While teams may have autonomy or work remotely, they are not isolated entities, but rather part of and dependent upon the larger organization for support. Reliability becomes an essential factor, where teams know they can depend on their leadership through consistency, follow-through, and congruency between action and words (Anderson and Caldwell 2018). Without this support, morale can suffer, erode confidence in the organization's commitment to the team, and adversely impact performance. Support can include: providing sufficient training, giving access to needed tools and information, and encouraging teams to become the best possible version of themselves (Anderson and Caldwell 2018).

Additionally, when a team is working at its optimum performance, recognition is essential. Whether psychic income such as praise, encouragement, or symbolic gesture, or tangible recognition such as financial incentive, acknowledgment, or lack thereof will impact the team's performance (Larson and LaFasto 1989). While individual rewards can be provided at the onset of work based on skill sets brought to the team, once the teamwork begins, financial incentives must be linked to the collective outcome of the team's performance rather than any individual (Caudron 1994). As the team begins to coalesce and develop a sense of collective identity, a team-based reward structure can be implemented. This in turn facilitates team identity and cohesiveness.

Organizations characterized by HPWTs have a cordial, collaborative, and congenial relationship with their teams. Team members are viewed as stakeholders with a vested interest in the organization (Cancialosi 2015). This results in the essential trust required for any high-performance endeavor and outcome.

## Conclusion

High-performance organizations and work teams are not mutually exclusive or random occurrences. These are inextricably linked phenomena

that require specific characteristics to inculcate a culture of flexibility, empowerment, and adaptability to embrace change. Today's global economy and technological advances require rapid respond. High-performance organizations utilize the talents and skills of their staff through empowerment and authority. Agencies have become structurally flatter enabling teams to problem solve, develop ideas, and adapt to the market. Optimizing the next generation of workforce will require dismantling the legacy organizational constructs that no longer apply or work. Like the private sector, public agencies are evolving to meet the demands of an ever-changing landscape.

# High-Tech Age and Public Sector HRM, The

Siegrun Fox Freyss
Department of Political Science, California State University, Los Angeles, Los Angeles, CA, USA

## Synonyms

High-tech epoch; Information age; Postindustrial age; Postmodern stage; Supermodernity

## Definition

High tech refers to the changes brought about by computer hardware and software and related innovations.

## Introduction

The high-tech revolution is bringing about many changes in human resource management (HRM) both in the public and private sector. However, laws governing HRM are quite different for the two types of employers, which affects the way they can make use of high-tech innovations. One of the most important differences is job security versus at-will employment. Other personnel principles and practices divert as well due to the different job security policies. The purpose of this article is to shed light on personnel procedures in the public sector that are changing due to the high-tech revolution. The article focuses on four developments:

- Job classification systems
- Recruitment and selection
- Human resource information systems
- Communication with the public

It is important that job classification systems are current, consistent, and fair since they are the foundation of important personnel decisions, such as, recruitment and selection decisions. Public Personnel Departments have important roles to play improving government performance, and human resource information systems can help in that effort. The internet provides excellent tools to communicate with the public, but there are potential pitfalls; the Human Resources Department can spearhead the training to ensure that all communication channels are handled in a professional way.

Other terms in need of clarification are public personnel administration, human resource management, and human capital management. The changes reflect different roles assigned by employers over time. Public personnel administration has been used for decades, when the Public Personnel Department had the role of managing payrolls and benefits. They were transactional functions. When Personnel Departments were asked to assume a strategic vision and make fundamental contributions to the growth of the agency, the term human resource management was widely adopted by employers. More recently, primarily in the private sector, the term human capital management emerged. This entry uses the terms interchangeably.

## Changes in Job Classification Systems

Job classification systems are the backbone of traditional bureaucracies. The systems assign all jobs to a class of jobs, based on information like this:

- The nature of the job
- Essential tasks to be accomplished
- Supervision given or received
- Educational background, and
- Previous work experience

Due to US Supreme Court rulings, the description of job classes has to be carefully researched using a well-crafted job analysis because the description has to be used for important personnel decisions, such as the announcements of open positions and the development of testing procedures. The Supreme Court ruled in *Griggs v. Duke*

*Power Company* (1971) that qualifications for a position have to be job-related and employers cannot require unrelated competencies (Tompkins et al. 2009, p. 10; Naff et al. 2014, p. 246; U.S. Office of Personnel Management 2017).

Job classification systems, currently, tend to have several shortcomings. First, they are too detailed and confusing. Human resource specialists can reduce the confusion by combining job classes. It is not uncommon to collapse 4000 classes of jobs into 1000. The National Academy of Public Administration (NAPA) went to the extreme by recommending a reduction of the number to three ranks/bands and seven classes. The bands are called developmental, full performance, and senior/expert. The seven classes are: office services, general support, technical, administration/analysis, engineering/sciences, health, and law enforcement. Pay schedules are collapsed as well. The NAPA study has received a lot of attention as a model, but employers have not adopted the extreme recommendation (Tompkins et al. 2009, p. 25). Research on the success of more moderate approaches in the form of best practices studies, as well as on principles and practices, is lacking (U.S. Government Accountability Office 2014).

Another shortcoming of job classification systems is due to the rapid changes in hardware and software. Job descriptions are supposed to be based on job analysis, which by its very nature focuses on past and present conditions. To deal with the uncertainty of the future, new questions can be added when conducting a job analysis:

> What changes in this job can be expected in 1 year, 5 years, and 10 years?

Other questions can ask:

> What changes in education and qualifications should be required of new job applicants in 1 year, 5 years, and 10 years?
>
> What changes in future knowledge, skills, abilities (KSAs) do you foresee?

Asking an individual employee these questions may not yield a lot of good information, but a panel consisting of employees from different departments and ranks may be very productive.

The reduction of job classes to a reasonable number makes sense in a high-tech environment that generates complex challenges. Like in the private sector, work in the public sector has gotten more complex, and a team approach is recommended because it is thought that teams are better suited than individuals to master the complexity and improve government performance (Flaherty 2013; U.S. Office of Personnel Management n.d.). The reduction of classes and ranks puts the team members on a more equal footing and avoids the resentment that is likely to occur when team members are pretty much doing the same work but receive substantially different pay. In the private sector, pay can be kept confidential, but not in the public sector, where it may be posted online or readily available through Freedom of Information requests. A second benefit of collapsing ranks and job classes is flexibility. The high-tech economy brings about changes quickly; and traditional job titles and pay may not reflect the new work that needs to get done.

## Recruitment and Selection

In government, human resource specialists are in a bind. On the one hand, job announcements are supposed to clearly describe job contents and required qualifications, but on the other hand, because of the ongoing high-tech revolution, the nature of future work cannot always be predicted. In the private sector, where at-will employment is common, employers can simply let "obsolete" employees go and replace them with new ones who have the latest competencies.

In contrast, in the public sector, civil servants have job security. Accordingly, the public employer needs to use different hiring strategies to find applicants who do not only have excellent KSAs in their field, but who are also willing to be live-long learners and whose KSAs therefore will not become obsolete over time (IPMA-HR HR2020 Task Force 2017). The questions above, asked in the context of a job analysis, can also be asked during the employee selection process either in an interview or as essay questions. However, job applicants

should be informed in advance about the inclusion of these questions so that they can prepare for them.

If the work will be done in teams, applicants will have to be tested accordingly, since not all individuals thrive in a team environment (Goleman 2005). Working in groups is common, and extensive research has been done on how to find the best candidate in an applicant pool (Robinson 2017. Team work can be greatly improved using social media because of the immediacy of the communication. However, one question deserves more research: Can high-tech equipment improve effective collaboration, or are employees tempted to waste time on unrelated texting, tweeting, and other social media?

## Human Resource Information Systems

Because of the many high-tech advancements, public personnel administrators are asked to think strategically, and human resource information systems (HRISs) can assist in that mandate (U.S. Office of Personnel Management 2016). Some of the capabilities are:

- Records of pay and benefits entered by HRM into a personnel data base; pretty much 100% of employers do so.
- Relatively new is the recommendation to enter records of each employee's competencies in a separate data base, such as college degrees, certificates, second language, performance evaluations, and past work projects.
- Use of the information on competencies to recommend preparation for a possible promotion, such as, job shadowing, mentoring by senior employees, attending workshops on supervisory skills, or executive leadership skills.
- Use of the information on competencies to let employees know that their performance is below expectations and how they can improve; the bad news may be easier to accept when it is coupled with learning opportunities.
- Perhaps poor performing employee is in a wrong job; learning about an alternative career path and making the career change may improve performance.

The high-tech age is also called the information age and for good reason. The computer in its various permutations is a device that excels in collecting and disseminating information, and Human Resource Departments have an important role to play since they control important data bases about their employees. Organizations like the International Public Management Association for Human Resources (IPMA-HR) do an effective job researching the benefits of HRISs, as well as possible pitfalls (Deep 2017).

## Communicating with the Public

The internet provides excellent tools that governments can use to communicate with the public (Mergel and Bretschneider 2013). In a democracy, government activities are supposed to be open and transparent, so that the government can be held accountable. Before the internet, it was difficult to find out what public agencies were actually doing. Nowadays, well-designed websites can become the virtual city hall, state capitol, or federal agency, often providing much better information than the yield from a visit to the bricks and mortar building. However, one needs to be aware that government can obfuscate information; external information sources may provide a correction or further play into the misrepresentation.

Email is another way to communicate with employees and the public. It pretty much has replaced the letter. However, government employees should not use their private account for public business, a rule that the presidential candidate Hillary Rodham Clinton violated, and she found out belatedly the unintended consequences of violating the rule. And vice versa, employees are not supposed to use their work email for personal business.

President Trump uses Twitter extensively, which gives him the opportunity to communicate with the public in an unfiltered way. Correctly done, social media can be time-consuming because one cannot jump into a Twitter exchange occasionally; instead, one needs to stay on top and add to the discussion before it dies down.

President Trump does not fall under this constraint considering that his tweets tend to start a chain.

In general, governments need to determine which agency or individuals should be responsible for the social media accounts. Human resource specialists can provide guidance to managers by creating new classes of jobs that identify the nature of the job, the essential tasks to be accomplished, etc. as described above in the section "Changes in Job Classification Systems." In addition, the Human Resource Department can provide the training on the proper use of social media. The training should be seen as a form of risk management. In the case of a violation, for instance, in a sexual harassment case, the employer may not be held culpable when it can prove that the offending party was trained and violated known employment rules.

## Conclusions

The high-tech developments have made management more complex by constantly introducing new issues into the substance of work and in the methods of accomplishing it. Human Resource Departments have the challenge of turning high-tech resources into applications or platforms that government agencies can use to become better performers internally in interaction with their employees and externally in interaction with the public (Freyss 2004).

The high-tech age is also called the information age, which reminds us that high-tech capabilities are supposed to make government a better employer and better service provider through information development. Human Resource Departments have the challenge of providing learning opportunities for others in the workforce, while simultaneously educating themselves, what is called training the trainers or building the airplane while flying it. Websites, emails, and social media have proven themselves as good vehicles among the national and international community of human resource experts and scholars in spreading useful or best practices but also identifying gaps in the knowledge base.

# Hiring Regulation and Public Administration

Pamela Gallahue
Naperville City Clerk's Office, Naperville, IL, USA

## Synonyms

Employment rules; Management of human capital; Personnel standards

## Definition

Laws that govern the solicitation, hiring, training, promotion, and termination of public sector employees.

## Introduction

Up to the late nineteenth and early twentieth centuries, all levels of government had earned the reputation of being corrupt political machines that took care of the members of their own party in reward for loyal service. Individuals were appointed to positions regardless of their education, experience, or competence. This overt political patronage and disregard for the constituents lead to a demand for hiring regulations and overall public service reform. The goal of implementing regulations was to ensure a professional, qualified, and nonpartisan civil service force. Hiring regulations consisted of non-biased exams, merit-based promotions, and prohibitions on political activities. Agencies were also created to review hiring practices and to hold those accountable when policies were violated. The model of hiring regulations and oversight that was created in the 1970s is still in effect today.

## In This Chapter

There are many reasons that people are attracted to a career in public service. The determination to effectuate change at local, state, and federal levels, the chance to work in a variety of areas such as transportation, human resources, and public safety, intellectual collaboration with bright and talented peers, and the opportunity to apply creative solutions in response to shrinking budgets, growing bureaucracy, and the inevitable red tape are just a few. Regardless of the individual, the desire to have an impact on, and make difference in, a person's life is ultimately at the heart of the motivation.

In the 1800s, the incentive to pursue a career in public service was not so altruistic, and earning a government job was not extremely difficult. Given the corrupt nature of politics and public service, there was an outcry for reform from not only the general public but also the nation's political scholars. In 1887 Woodrow Wilson introduced the debate of defining the role between politics and administration. Frank Goodnow followed Wilson's lead and weighed in on the need to separate politics from the day-to-day management of government responsibilities. Wilson and Goodnow, the founding fathers of this school of thought, believed that separation of duties was critical to the success of the other's function. They also supported a neutral civil service that was free of political influence, making government more efficient by implementing businesslike practices and striving to professionalize the public sector through training and improved hiring regulations. Finding the appropriate balance between the roles and responsibilities for politicians and professionals sparked an argument that continues today.

This chapter will discuss the chain of events that occurred in the late 1800s which ultimately lead to the reform of the civil service system. It will also examine when the theory of public administration was introduced into the political arena and how the nexus of these two subjects have influenced the education, hiring, selection, and protection of today's public servants.

## The Spoils System

Andrew Jackson was elected president in 1828. He believed that a number of his initiatives were

not being recognized because of political influence of civil servants. Under the guise of reform, he began rotating people out of their job posts. According to the administration, Jackson was justifiably removing individuals that had been hired nearly four decades earlier (McNamara 2014). However, Jackson opponents reported that approximately 700 federal employees were fired in 1829 which had a negative effect on commerce and other operations in Washington (McNamara 2014). Stating political cronyism and corruption as the reasons for removal, Jackson began replacing the vacated positions with individuals that had supported his campaign. In 1832, New York Senator William Marcy responded to criticisms of patronage by stating, "to the victor belong the spoils" (Miller Center of Public Affairs).

Although the label of "spoils system" ultimately degenerated into a philosophy where political service meant more than competence, rotating employees out of service did work relatively well with a small government responsible for delivering a limited scope of services (Shepherd 2003). However, small government did not last long, and after the Civil War, America ushered in the Gilded Age. The rail system spawned massive business growth and the invention of items such as the telephone and automobile. This expansion in commerce and communications resulted in the need for increasingly complex and diverse government functions. Federal agencies and state governments were multiplying and becoming more involved in specialized areas such as agriculture, industrialization, education, and public health (Finkelman 2001).

Similarly, as the levels of government diversified and entered these areas, the civil service also needed to grow quickly and place people in much needed positions. These new fields drew interest from college-educated, experienced individuals who believed they had earned the right to compete for a position in government. At the same time, citizens pressed for more qualified, honest, and responsive representation. These individuals also believed that elected officials should be subject to public scrutiny and held accountable for their actions. Regardless of rank or position, proponents of change wanted assurance that any violation of public duty would be subject to legal, financial, or constitutional sanctions (Thayer 1997). Lastly, reformers held that additional benefits of a more professional and accountable government would not only be a reduction in wasteful spending but also a more efficient administration.

## The Civil Service Reform Effort

In March 1871, President Ulysses S. Grant capitalized on a lame-duck session of Congress and succeeded in getting an important appropriations bill passed. The bill included a provision allowing for the creation of the US Civil Service Commission. The Commission was charged with drafting rules for federal employee hiring exams. After the initial request of $100,000 was denied, Congress ultimately appropriated $25,000 to fund the Commission for 2 years (Kennedy 2001). The Commission operated without any legal authority, and the regulations that were passed would only apply to future office holders. As a result of the avalanche of congressional criticism and staunch resistance to change, President Grant was forced to abandon his reform efforts. Funding was discontinued in 1875 and the rules were indefinitely suspended the following year. However, in the Commission's short-lived existence, it was successful in drafting rules aimed at creating a more fair and professional workforce by designing specific and detailed screening protocols for federal job applicants (Kennedy 2001).

The next president, Rutherford B. Hayes, requested funding but was denied. Instead, without legislative authority or support, he took up the cause and issued an executive order in 1877 prohibiting civil servants from managing several types of political activities such as events and campaigns. Unfortunately, the order was not consistently followed, and President Hayes removed several individuals from office that continued to ignore it and investigated federal agencies suspected of profiting from contracts in violation of the order. Civil service reform legislation did not pass during President Hayes' time in office, but he made significant progress to further the

awareness and importance of the initiative. His efforts were also successful at laying the groundwork for sweeping legislation in the following decade.

Roscoe Conkling, a senator from New York, was the head of the Stalwart faction when James A. Garfield was elected in 1880. Conkling was opposed to reform; however, the faction needed to support a presidential candidate. The senator believed that Garfield was a better choice than James G. Blaine because Blaine was the leader of the Stalwart's rival, the Half-Breed party. Without Conkling's backing, Garfield would have been defeated by Winfield S. Hancock, the candidate for the Democratic Party. While Garfield relied on Conkling's advice during the campaign, he chose to ignore it after the election when appointing members of his administration. Garfield disliked patronage and had campaigned in favor of the reform movement. However, he understood that he was elected by a narrow margin and knew it was critical that he appeal to the opposition by creating a bipartisan staff. In the end, after all of the appointments had been named, one party faction, the Stalwarts, received fewer nominations. Senator Conkling tried unsuccessfully to block Garfield's choice for the Collector of the Port of his home state of New York and ultimately resigned in protest (Kennedy 2001).

After the conclusion of the confirmation hearings, Garfield began to move forward with his reform agenda. On July 2, 1881 he was fatally shot in the back at a train station by Charles J. Guiteau. Guiteau, a member of the Stalwart faction, did not receive an appointment in the Garfield administration. He was later identified as having emotional issues which may have contributed to this tragedy. Nonetheless, the president died from the gunshot wound on September 19, 1881. His death revitalized interest in the need for civil service reform. Garfield's successor, Chester A. Arthur, also advocated for change and relied heavily on Senator George Hunt Pendleton to guide reform legislation through Congress. Finally, in 1883, Congress passed the Pendleton Act.

The Pendleton Act provided for the creation of a permanent, three-member Civil Service Commission. This Commission would operate independently of the executive branch and be charged with enforcing the rules set forth in the Act. Although some of the most flagrant political machines existed at the state and local levels, the Civil Service Commission's efforts were largely constrained to bringing about change at the lower, entry levels of the federal government. Because the Act provided that jobs shall be awarded on the basis of merit and that employees could not be fired for political reasons, the Commission focused on fair and open competition for federal jobs. The Commission also concentrated on admission to the service based on the results of an exam and protecting employees from political patronage and partisan behavior once hired (Ingraham and Rosenbloom 1990). In 1883, New York was the first state to adopt the civil service philosophy. Other states such as Illinois and Wisconsin (1905), Colorado (1907), New Jersey (1908), and Ohio (1912) began adopting merit-based systems within two decades (Cayer and Parkes 2001).

## The Politics and Administration Dichotomy

At about this same time in history, Woodrow Wilson was teaching at Bryn Mawr College. Professor Wilson brought attention to the fact that colleges were introducing courses focused on the science of administration. While related to the science of politics, Wilson explained that the science of administration was different and stated that "it is the object of administrative study to discover, first, what government can properly and successfully do, and, secondly, how it can do these proper things with the utmost possible efficiency and at the least possible cost either of money or of energy" (Wilson 1887, p. 197). New areas of trade, finance, personnel, and commerce made it clear that running a government was becoming more difficult. Actions from the prior several years had sent an unmistakable message that the American public recognized this complexity and also desired a government that exhibited more accountability and

responsiveness. Wilson believed that a science of administration was critical in order to straighten the path of government, make government more businesslike, and improve the organization of the government (Wilson 1887, p. 201).

He supported the current civil service reform movement and the need to separate corrupt political practices from the activities of day-to-day administration. He too was concerned with partisan influence, ineffective congressional oversight, inefficient and wasteful government operations, a lack of citizen involvement, and the hiring of unqualified personnel. To that end, he argued for a clear delineation between politics and administration. In his seminal article, The Study of Administration, Wilson theorized that politics and administration should operate as independent and separate functions (Wilson 1887). Specifically, he stated that the civil service movement was simply the beginning of more sweeping administrative reform and that it was "clearing the moral atmosphere of official life by establishing the sanctity of public office as a public trust, and, by making the service unpartisan, it is opening the way for making it businesslike" (Wilson 1887, p. 210). To Wilson, the "field of administration is the field of business, it is removed from the hurry and strife of politics, and that administration lies outside the proper sphere of politics" (Wilson 1887, p. 18 and 210). This separation later became known as the politics-administration dichotomy, and the extent to which the two functions can, and should, interact with each other has been debated for decades.

The first to support Wilson's theory was Frank Goodnow. He stated that the powers of the three branches of government could be distilled down the two primary responsibilities of expression of will and the execution of that will. He argued that the function of politics was to express the popular will and the role of administration was to execute that will (1900). While he believed that a strict separation between politics and administration was not possible and that interaction between the two functions was necessary, he still supported the need for a civil service free of political motives and manipulation.

Over the years scholars have put forth their own models of the dichotomy. For example, some interpret the dichotomy as a severe separation between politics and administration. In their view, administrators are to provide expert advice to officials in a myriad of areas while maintaining political and policy neutrality (Kaufman 1956). This model is best exemplified in the council-manager form of government at the municipal level. Here, a professionally trained administrator operates outside the sphere of politics and is charged with implementing the policies of the elected city council members. Others see administration as inextricably linked to the political process. Ineffective legislation and politicians' general lack of technical knowledge require administrators to have an active role in the policy-making process (Lipsky 1980). A third group of scholars represent a hybrid model and believe politicians and administrators should operate in a highly collaborative environment. This group acknowledges the two areas have different values, backgrounds, and goals, but stresses that each has a critical role in delivering sound governance to the public. Here, elected officials and administrators maintain distinct roles, but the functions overlap in a mutually supportive way (Svara 2001).

Each school of thought has attracted support, critical reviews, and identification of shortcomings. For example, those that support the interactive philosophy will draw reproach for being vulnerable to questionable political involvement and ultimately exhibiting the very behavior that the dichotomy, and civil service reform, was intended to prevent. A flaw in the strict separatist model is that it assumes the professional administrator operates with a reasonable moral compass. A second weakness in the model is that it also presumes the policies that are to be implemented are clearly written and can be easily interpreted.

Offering a definitive model for the appropriate level of interaction, or lack thereof, between politics and administration is a daunting task. The discussion has continued for more than 100 years and is still taught in colleges for students to debate today. Whether or not politics and administration

are linked in practice, the literature has assured that they will forever be linked in theory.

## Striking a Balance: The Civil Service Reform and Dichotomy Nexus

As scholars continued to debate the politics and administration relationship in the early twentieth century, the reform movement soldiered on and tried to strike the appropriate balance between the two. On August 2, 1939 the Hatch Act was passed. Named for Senator Carl Hatch of New Mexico, it expanded the Pendleton Act to include restrictions on political activity for federal employees. Generally it held that employees cannot take "an active part" in political campaigns and elected officials cannot employ manipulative measures such as employment, monetary rewards, or the promise of contractual awards to coerce political support (Schultz 2009). Less than 1 year later, on July 19, 1940, the Act was revised to include employees at the state and local levels whose pay was supplemented by any federal funding. For example, the Social Security Act required that state employees involved in nationally funded programs be covered by merit systems so in order to participate in Social Security, it was necessary for the states to create merit systems for their employees (Cayer and Parkes 2001).

In some states, merit systems and other reform efforts were modeled after the federal government and featured a central personnel office with a multimember Civil Service Commission. Other states created a personnel office with a single director and no board. Regardless of the structure of the system, hiring and employment reform was occurring at the state level and would eventually be expanded to local governments (Cayer and Parkes 2001). And, just like at the state level, the development and structure of civil service reform varied at the local level. By the mid-1900s, most large cities had developed some sort of merit system. However, they were not as prevalent in smaller cities and counties because the number of government employees was not as great.

In the late 1960s and early 1970s, America's political and personnel landscape was being challenged. In addition to the proliferation of civil service reform, the civil rights and women's rights movements were demanding additional government change. In light of the new issues facing elected officials and the rising distrust of government, the Carter Administration believed it was time to evaluate the federal Civil Service Commission and make modifications as necessary. Because the relationship between politics and administration had evolved into a strict separation, the civil service system was found to have become inefficient, unresponsive to, and insulated from, political direction. The system had also accumulated a myriad of bureaucratic procedures and was not demographically representative of the United States. An examination also revealed that the Commission was not protecting employee rights against allegations of discrimination nor providing a mechanism for independent oversight of labor management issues. Lastly, the Commission had become "pressured by its dual mission of administering the personnel function and serving as the president's personnel advisor" (Rabin 2003, p. 197).

Taking a cue from the more decentralized management approach employed by the states and the need to relieve the Commission of its conflicting mission, President Carter passed the Civil Service Reform Act (CSRA) in 1978. The CSRA abolished the Civil Service Commission and replaced it with three new organizations. The Office of Personnel Management (OPM) was established to research, examine, and direct personnel regulations. The Merit Systems Protection Board (MSPB), which included the Office of Special Counsel, was charged with processing the appeals of civil servants and civil service applicants, and the Federal Labor Relations Authority (FLRA) addressed employee collective bargaining and union matters.

In addition to the obvious structural changes aimed at improving efficiencies, the CSRA reaffirmed the government's commitment to improving the effectiveness of the federal hiring system. A number of public administration values were also reinforced by the CSRA. Among the most important was the focus on the appropriate relationship between politics and administration

and ensuring a professional civil service. The CSRA stressed the proper implementation of the merit system. This section of the Act specifically discussed hiring, performance, equal pay, retention, training, whistle-blowing, protection from partisan politics, and using the workforce as efficiently and effectively as possible (Coggburn 2003). Additional public administration principles identified in the CSRA included a list of prohibited personnel practices, executive oversight of the personnel policies, a demographically representative workforce, decentralization of responsibilities to line level agencies, and private sector management techniques addressing performance evaluation and pay for performance (Coggburn 2003).

The goal of the CSRA was to create a more efficient, effective, and responsive personnel system. It has been roundly criticized in the literature for failing to deliver in several areas. However, the CSRA is still regarded as one of the most prominent pieces of legislation because it established the framework for federal personnel management that is still broadly applied (Coggburn 2003). Today's Office of Personnel Management has been built upon a foundation of respect for its history. A cursory examination shows how reform history has been preserved and woven into the current mission. By providing policy oversight, healthcare and insurance, retirement services, and assistance to other federal agencies in the hiring process, the OPM continues to be the torchbearer of service professionalization and a daily practitioner of the politics-administration dichotomy.

## Conclusion

Through practice and literature, a clear argument was made for the separation of politics and administration which helped justify much needed civil service reform. Sweeping public sector change was achieved by defining parameters for each function and developing fair and impartial hiring, promotion, protection, and termination regulations. While implementation and organizational structure varied between the levels of government, the message was consistent and the goal was universal, to develop a more professional and efficient civil service insulated from political gamesmanship. This philosophy that was first put forth more than 100 years ago by Woodrow Wilson and early reformers still holds firm today and continues to be reflected in public sector hiring regulations.

# Historic Black Colleges as Social Policy

Victor Eno
Department of History and Political Science, Florida Agricultural and Mechanical University, Tallahassee, FL, USA

## Synonyms

Education for political empowerment; Historic black colleges and universities (HBCUs) in the United States; Social engineering; Social mobility

Historic Black colleges and universities or (HBCUs) emerged after the end of the American Civil War in 1865 to offer opportunity to freed Black slaves to gain education. These colleges also served as vehicles for newly emancipated Blacks to obtain education and learn skills that enabled them to function in the new American society based on freedom and emancipation from slavery. Prior to the Civil War, higher education (and any form of formal education for that matter) for African Americans was virtually nonexistent.

## History

During slavery, slave states were very deliberate in barring enslaved African Americans from acquiring literacy, that is, the ability to read and write. These states enacted legislation that made it a crime for slaves and their offspring to receive education; they could not be found with books, neither could they be taught to read and write or even attempt to teach themselves to read and write. The intention was to keep them in darkness and perpetual servitude because white slave owners, and indeed white society, feared that if the enslaved became literate they would ask questions and demand freedom. It was in the strategic, enlightened self-interest of slave owners to keep the enslaved illiterate so that they would not threaten the social order.

In spite of all the efforts to prevent the enslaved from obtaining literacy, a few slaves struggled to read and write by devising a number of covert measures to get books to read and learn to write. In the period before the Civil War, a few groups and individuals with good conscience worked to help African Americans obtain literacy. They organized schools, or institutions that looked like schools, which provided enslaved black youth the opportunity to read and write and obtain basic education and training to become teachers or tradesmen. One example was a group of Philadelphia Quakers who, in the 1830s, established the Institute for Colored Youth which afforded African Americans the opportunity to receive education. The Institute, which opened on a farm outside of Philadelphia in 1837, could be regarded as the precursor to historically black colleges in the United States. It later became Cheyney University of Pennsylvania, which is presently a part of the Pennsylvania State System of Higher Education.

Another pre-Civil War effort to establish schools for black was made in 1854 with the founding of the Ashmun Institute in Philadelphia, which offered theological training and basic education. It became Lincoln University in 1866 in honor of President Abraham Lincoln and remained a private institution until 1972 when it became a member of the Pennsylvania State System of Higher Education. However, Wilberforce University in Ohio is arguably the oldest full-fledged private historically Black university in the U.S. It was founded in 1856 by the Methodist Episcopal Church as a coeducational institution for black who had escaped slavery in the South through the Underground Railroad. It closed in 1862 but was reincorporated in 1863 under the auspices of the African Methodist Episcopal (AME) Church, a historically African American Methodist denomination.

In the period following the end of the Civil War, increased efforts were made in other parts of the country to establish institutions for education of freed blacks. For example, barely six months after the end of the Civil War, three like-minded men -John Ogden, the Reverend Erastus Milo Cravath, and the Reverend Edward P. Smith

-united by a strong purpose to advance the condition of Black people in the post-slavery era, established the Fisk School in Nashville, Tennessee. The Fisk School, which later became Fisk University, was founded for the education of freed descendants of enslaved Africans. It was named in honor of General Clinton B. Fisk of the Tennessee Freedmen's Bureau, who provided the institution with facilities in the former Union Army barracks. The university's first class was held on January 9, 1866, with students who ranged from the age seven to seventy years. All students were victims of slavery and poverty but shared a common interest in learning (See the Fisk University History page at https://www.fisk.edu/about/history).

It should be noted that all through these periods, i.e., the pre- and post-Civil War years, racial segregation had placed a heavy burden on African Americans and prevented them from attending the then existing majority institutions. The only schools that African Americans could attend were the ones they established. And whatever schools blacks were able to establish were few and far between. They could not really fit the description of the typical standard schools of the day. They were poorly resourced. They could only offer elementary education and training in vocational skills. This explains why all the existing schools, that is, schools in the real sense of the word, were founded by whites. Also, concerned white people directly founded or were behind the founding of all of the early historically black colleges in the years before and immediately following the Civil War.

According to (Allen et al. 2007, p. 267), African Americans staffed their own schools and used literate and semi-literate members of the community to educate newly freed slaves. The majority of the institutions established by blacks themselves in the post-War period were funded by churches, specifically American Missionary Association, Disciples of Christ, and African Methodist Episcopal Church. But those early HBCUs received little to no state and federal support and often suffered from shortage of financial resources and adequately trained staff; therefore, they had to rely on White philanthropic and missionary societies to function and continue to serve the black community.

In the course of the Civil War, and with the eventual abolition of slavery on the horizon, there was growing awareness among the political elite, and some in the dominant culture, that the country would be beset with a ticking time bomb. The country would face the specter of a large mass of illiterate formerly enslaved individuals who would be expected to exercise democratic rights of voting as citizens and function effectively in an emerging industrial society. Many people had begun to wonder what should be done about freed blacks who could not read or write and had no functional education. This was because, as freed people, illiterate African Americans would be a liability to the country, and it was widely realized that they must be educated.

This dilemma obviously motivated the long-serving U.S. Republican legislator from Vermont, Senator Justin Smith Morrill (1810–1898), to propose legislation that later became the Morrill Act of 1862. He had the creative idea that federal lands could be granted to states to incentivize them to established schools and colleges for the training and education of freed black people, or if they could not use the land themselves they, could sell them to commercial interests and use the proceeds for educational enterprises. Morrill served 12 years in the House of Representatives (1855–67) and 31 years in the Senate (1867–98).

Named the Morrill Land-Grant College Act of 1862, or simply the Morrill Act of 1862 in honor of Senator Morrill, it provided grants of land to states to finance the establishment of colleges specializing in "agriculture and the mechanic arts." It granted each state 30,000 acres for each of its congressional districts. Funds from the sale of the land were used by some states to establish new schools; other states turned the money over to existing state or private colleges to create schools of agriculture and mechanic arts (known as "A&M" colleges or Agricultural & Mechanical colleges/universities). (See "Land-Grant College Act of 1862" in Encyclopedia Britannica at

https://www.britannica.com/topic/Land-Grant-College-Act-of-1862).

The Act had a military training component. The military training required in the curriculum of all land-grant schools led to the establishment of the Reserve Officers' Training Corps (ROTC), an educational program for future army, navy, and air force officers. The Morrill Act of 1862 was a significant first step that led to other developments in higher education in America, and in particular, the education of freed blacks. A combination of factors including the Morrill Act (1862), the end of the Civil War (1865), the promulgation of the landmark Thirteenth Amendment (1865) which abolished slavery, and Reconstruction (1865–1876), heralded change in America's socio-economic, political and cultural landscapes. That short period of a little more than a decade represented a significant milestone in America's history regarding the turnaround in the fortunes of African Americans.

The end of the Civil War was followed by Reconstruction, a period of national reconciliation and re-building from the ruins of the War. Reconstruction and the Morrill Land-Grant Act created an enabling environment that ushered in the era of the historically black colleges and universities (HBCU). It should be added that the Freedmen's Bureau was another significant factor that enhanced the fortunes of black people in terms of its contribution to the education and rehabilitation of free black people.

The Freedmen's Bureau was a federal agency that operated during Reconstruction to help former slaves adjust to freedom. The support provided by the Bureau, alongside with the Morrill Act, was instrumental for the establishment of HBCUs throughout the South and other parts of the country. Historic black colleges established in the immediate post-War years, that used the resources of the Morrill Act and the support of the Freedmen's Bureau, included Atlanta University founded in 1865 and now called Clark Atlanta University; Howard University, chartered in 1867, and named in honor of Major-General Oliver Otis Howard, a leading pioneer of the Freedmen's Bureau; Morehouse College also founded in 1867, originally called the Augusta Institute, among others.

These institutions provided a liberal arts education and trained students for careers as teachers or ministers and missionaries, while others focused on preparing students for industrial or agricultural occupations under the framework of the A&M colleges. In the Atlanta, Georgia area, Morehouse was and continues to be an all-male while Spelman College established in 1924 (originally founded in 1881 as Atlanta Baptist Female Seminary) remains all-female. These are just a few examples of HBCUs that adopted single-sex educational model but most are coeducational.

However, the early HBCUs were struggling financially and could not fill the yawning gap in educational opportunity between the majority population and masses of recently freed black people who yearned for education. A great number of black people lacked opportunity and the means to attend schools and colleges because racial segregation remained a severe reality: Black youths were turned away from the better-resourced state public schools and private schools and colleges.

The second Morrill Land-Grant Act of 1890, (an amendment of the 1862 Act), was an attempt to solve this problem. It specified that states using federal land-grant funds must either make their schools open to both black and white or allocate money for the establishment of segregated black colleges to serve as an alternative to white schools. The 1890 Act resulted in the establishment of a few more predominantly African American colleges and a number of American Indian colleges. It also stipulated regular Congressional appropriations that not only supported but also breathed a new lease of life into the land-grant colleges.

In spite of the funding and other challenges (including controversies as to the direction they should follow) that they have faced from the 1860s through the 1890s, which have persisted even to the present, HBCUs have fulfilled enormous responsibilities in the socialization and education not only of blacks in the United States but also citizens of other nations in the world. They remain a driving

force in socio-economic mobility, political empowerment, and cultural advancement in the United States.

## Historic Black Colleges and Universities as Social Policy

From the beginning, the historic black colleges and universities have managed to survive many adversities. They were founded to fill the urgent need of educating freed black. This was against the background of the fact that, prior to the Emancipation Proclamation in 1863, every slaveholding state in the United States had some form of legislation that forbade blacks from learning to read and write, so when freedom beckoned, African Americans who had been denied the opportunity to learn craved to take the new educational opportunities offered by the HBCUs. It is should be emphasized that only the HBCUs provided such opportunities. They have continued to provide educational and training opportunities for not only African Americans but also other racial/ethnic groups in the United States for over one hundred and sixty years.

The HBCUs have served as veritable instruments of social policy and social engineering. They have helped black people lift themselves from their bootstraps. They were founded under the most impossible conditions and despite stiff opposition of Southern conservatives, before and after Emancipation, who viewed educational access for freed slaves as a threat to White supremacy. All of the obstacles put in the way of the HBCUs did not dampen the aspirations of freed black who believed that education was the "ultimate emancipator" that would enable them to distance themselves from slavery, move past their subordinate status in society, and achieve social mobility (Allen et al. 2007, p. 267).

Early on in the history of HBCUs, controversy arose as to whether they should be focused on teaching basic vocational skills and social etiquette to black or whether they should be engaged in liberal arts education that would entail the teaching the classics, history, philosophy, and modern science. Two schools of thought emerged led by two accomplished African Americans: Booker T. Washington and W.E.B. DuBois. Washington, a distinguished entrepreneur and industrialist, believed that the black colleges should be focused on vocational education that would equip black youth with relevant skill-sets to gain employment and make a better life for themselves. DuBois, a Harvard-trained sociologist and an advocate for civil rights, thought that black colleges should not only be focused on vocational education but they should also promote liberal education in the classics, political education for enlightenment and empowerment so that black can better assert their rights and citizenship.

Perhaps, the journeys that these two men took in life, given their background, explained why they were on different sides of the 'industrial' versus 'classical' education argument. Washington, a freed slave from Virginia, attended the Hampton Normal and Agricultural Institute (later renamed Hampton University), which focused on preparing young Blacks throughout the South to fill jobs in the skilled trades. Washington became an apprentice of Hampton's president and decided to establish his own school after graduating. In 1881, he founded and led Tuskegee Institute which later became Tuskegee University. Tuskegee became famous for its practical curriculum and focus on preparing black for many agricultural and mechanical trades. Washington was applauded by some and criticized by others for his advocacy of black advancement through vocational training and racial conciliation. He believed that the best way for freed slaves and other black to attain equality in the United States was through the accumulation of power, wealth, and respect by means of hard work in practical trades. (See Hannah Purnell, "The History of Historically Black Colleges and Universities: A Tradition Rich in History" at http://www.collegeview.com/articles/article/the-history-of-historicallyblack-colleges-and-universities).

DuBois, on the other hand, was raised in Massachusetts and was first exposed to segregation during his undergraduate work at Fisk University (Purnell). He felt that Washington's advocacy for universal vocational training only perpetuated the

servitude of slavery. He argued that equality and a sense of purpose would only come if talented black were allowed to study the arts and sciences – the need for cultivating a "talented tenth" of well-educated African American community leaders.

This ambivalence as to what educational trajectory they should follow has defined the journey of HBCUs. However, overall they have done very well. They have acquitted themselves in fulfilling the three basic functions of an educational system: the tooling, socializing and politicizing functions (LeMelle 2002). The tooling function entails preparing citizens to translate the internalized values of the community into an economic reality for achieving maximum well-being. The socializing and politicizing function involves creating, maintaining and propagating the political and social values and interests of the community. Within the context of the political and economic power realities of black/white relations in the United States, and given the tremendous difficulties that they have historically faced, it can be asserted that both private and public HBCUs have been successful. And even though they still have to grapple with these difficulties and re-invent themselves, the future looks bright for these colleges.

# Historical Analysis of Third Sector

Gabriela Vaceková[1] and Michal Plaček[2]
[1]Faculty of Social Science, Charles University, Prague, Czech Republic
[2]National Museum of Agriculture, Prague, Czech Republic

## Synonyms

Civil society; Independent sector; Nongovernmental sector; Nonprofit sector; Voluntary sector

H

## Definition

The third sector is an umbrella term that covers a range of different nongovernmental nonprofit organizations with different structures and purposes, belonging neither to the public sector (i.e., the state) nor to the private sector (profit-making private enterprise).

## Introduction

Nonprofit organizations play an important and irreplaceable role in building a civil society. There has been a considerable surge of interest throughout the world in a broad range of organizations that operate outside the market and the state. Known variously as the nonprofit, nongovernmental, voluntary, civil society, third, or independent sector, organizations that can demonstrate that their activities generate a public benefit or common social good exist in some form of special incorporation or registration in every country (Casey 2016).

In recent decades, the activity and influence of nonprofit organizations have grown exponentially. Salamon (1994) wrote about a global "associational revolution" focusing primarily on the growth of nonprofit organizations and their increasing role in service delivery. Nonprofit organizations have become central to policy

making, the promotion of civic action, and the delivery of new quasi-public services, as well. In addition to being more numerous, modern nonprofit organizations are markedly more secular and nonpartisan in their affiliations, more universalist in their service delivery and policy-making aspirations, and more professionalized and commercialized in their operations than earlier iterations rooted in religious charities, political movements, or grassroots collective and voluntary action.

Collective social endeavors that do not seek direct personal gain for individual participants are as old as human civilization itself (Casey 2016). The term civil society dates to ancient Greek and Roman philosophers who considered societas civilis "one in which good citizenship collectively shapes the nature of a society" referring to both the state and non-state elements of a society. Later, the focus of the discourse shifted to non-state societal structures and their relationship to the state. Currently, the term civil society appears frequently as a general equivalent for the nonprofit sector. However, unlike the concept of the third sector, which focuses on organizational structures, civil society is primarily conceived as the space or sphere between the market, state, and family in which people organize, uncoerced, to pursue their interests.

## Definition of Nonprofit and Third Sector

The most widely accepted definitions of nonprofit organizations and the nonprofit sector are based on a combination of structural and functional characteristics that describe the organizational forms they adopt and the activities they undertake (Casey 2016). The Johns Hopkins Comparative Nonprofit Sector Project definition, later adopted by the United Nations for the purpose of creating comparable national surveys of nonprofit institutions, uses the following five criteria for defining a nonprofit organization (Salamon and Anheier 1998):

- Organized, i.e., institutionalized to some degree in terms of their organizational form or system of operation
- Private, i.e., institutionally separate from government
- Nonprofit distributing, i.e., not returning any profits generated to their owners
- Directors but plowing them back into the basic mission of the agency
- Self-governing, i.e., equipped with their own internal apparatus for governance
- Voluntary, i.e., involving some meaningful degree of voluntary participation in the operation

In the "structural-operational" definition by Salamon and Anheier (1998), the non-distribution constraint is identified as a structural feature of nonprofit organizations. The non-distribution constraint allows nonprofit organizations to make profits but does not allow the distribution of the profit to managers or employees of the organization. A nonprofit organization that earns a profit in any period may direct these resources in one of three ways: increase expenses so that the profit is used up in current operations, invest in fixed assets which presumably will be used in providing mission-oriented services, or retain the profits as a source of internal capital.

An alternative definition for the "extended" third sector was proposed by loosening the "structural-operational definition" (Salamon and Anheier 1998) and replacing "not profit distributing" with "totally or significantly limited from distributing any surplus they earn to investors, members, or other stakeholders," while keeping the other four features of the third sector virtually unchanged. Salamon and Sokolowski (2016) also suggest that not only organizations but also informal and individual components are important elements of the extended third sector. They propose five conditions, the first three of which being mandatory, that organizations in the extended third sector must fulfill to meet the "significant limit on surplus distribution" requirement. Those are:

1. An explicitly and legally binding social mission.
2. Prohibition from distributing any more than 50% of any profit to outside stakeholders.

3. A capital lock that requires all retained surplus to be used to support the organization or to support other entities with similar social purposes.
4. At least 30% of their employees and/or beneficiaries are individuals with specified special needs.
5. Prohibition from distributing any profit they may earn in proportion to capital invested or fees paid.

This broader concept has remained under-conceptualized in reliable operational terms. Salamon and Sokolowski tried to correct this shortcoming and presented a consensus operational reconceptualization of the third sector created by a group of scholars working under the umbrella of the European Union's Third Sector Impact Project (http://thirdsectorimpact.eu/). This re-conceptualization goes well beyond the widely recognized definition of nonprofit institutions from the *Handbook on Nonprofit Institutions in the System of National Accounts* (United Nations 2003) by including additional institutions and forms of direct individual activity in a way that meets the demanding criteria of comparability, operationalizability, and potential for integration into official statistical systems. The Third/Social Economy (TSE) model proposed by Salamon and Sokolowski (2016) builds on major advances in scholarly work on nonprofits, volunteering and related concepts and seeks to build the foundation for new advances.

A related approach is to focus on what makes nonprofit organizations distinctive from organizations in other sectors. First, there is a three-sector framework (see Fig. 1). In order to describe the organizations operating within the third sector, nonprofit scholars use the term "private nonprofit organizations" as the most accurate one for expressing the fact that these organizations result from a three-sector economy. The concept of a distinct third sector emerges from the analyses that separate government from nongovernment and for-profit from nonprofit. The sectors are distinct, but also linked and overlapping. By convention, government is identified as the first sector, business as the second, and nonprofit as the third. The three sectors are also often characterized as "the Prince, the Merchant, and the Citizen" (Casey 2016). The existence of a trichotomy of three distinct sectors (or social domains, spheres, or realms) permeates Western thinking (Casey 2016). Classical liberal theorists emphasize the separation between public and private, whereas poststructuralists focus on the continuities and cross influences.

The institutional framework focuses on the structures and processes that continue to shape the dynamics of the nonprofit sector and its relationships with the public and for-profit sectors. A related approach concerns what makes

**Historical Analysis of Third Sector, Fig. 1** Scheme of three sectors of the national economy

nonprofit organizations distinctive from organizations in other sectors. Nonprofit organizations differ from government entities and for-profits due to their unique combinations of production functions, governance structures, revenue sources, staffing, and their legal and tax system. As they are neither governmental nor for-profit, nonprofit organizations have been seen as potentially combining the best of the two sectors: "the public interest, responsibility, and wide perspective of government, melded with the efficiency and knowledge of business" (Etzioni 1973). All of the characteristics ascribed to the sector have their own gray areas of definitional disputes. Clear definitions are elusive and the various attempts to find neat fault lines between the sectors have only served to underline the demarcation challenges.

Nonprofit organizations fulfill a large variety of functions in democratic. Following Boris and Mosher-Williams (1998), social, civic, and economic functions can be detected to describe the roles of nonprofit organizations. Kramer (1981) identified four key roles and functions: service provider, innovator, guardian of values, and advocate. However, a closer look at the categorizations of nonprofit functions offered in literature shows that they are manifold and differ greatly. Nonprofit organizations may fulfill two major functions in contributing to the security and stabilization of society while at the same time stimulating societal advancement. In many countries, nonprofit organizations assume a mainstay role in integrating disadvantaged groups through the provision of social services and hence constitute "social mollifiers." Simultaneously, nonprofit organizations assume an "expressive function" by giving a voice to societal issues such as the protection of the environment.

The nature of the services that private nonprofit organizations provide can be as follows:

- Mutually beneficial services: private nonprofit organizations implement the interests of their founders, direct their activities at meeting the needs of a small group of people (an interest group), and are established on a membership basis; for example: civic associations, political parties and movements, chambers, clubs, and associations.
- Generally beneficial services: private nonprofit organizations meet generally beneficial objectives and serve everybody under the same conditions that are known in advance; for example: civic associations, foundations, non-investment funds, and nonprofit organizations providing generally beneficial services, in particular as follows:
  - Provision of health care
  - Provision of social assistance and humanitarian care
  - Creation, development, protection, restoration, and presentation of spiritual and cultural values
  - Protection of human rights and fundamental freedoms
  - Education and development of physical culture
  - Research, development, scientific and technical services, and information services
  - Creation and protection of the environment and protection of public health
  - Services in support of regional development and employment
  - The provision of housing, management, maintenance, and renewal of the housing stock
- Public utility services: private nonprofit organizations carry out tasks related to public interest, fulfill the tasks of the municipality or the state, or secure other public functions; they are subject to public scrutiny and usually have financial relations with public budgets.

## Theoretical Approaches (a Historical Analysis)

The existing theoretical approaches to nonprofit organizations can be classified into three groups: those reflecting the limitations of the economic system; those reflecting the limitations of the political system; and those that cannot be attributed to the failure of any specific functional system. The third group may seem vague, but it can be conveniently conceptualized in terms of the

societal values that are reinforced by the missions of the particular nonprofit organizations. As Valentinov (2012, p. 83) wrote, "the role of the nonprofit sector is in reconfiguring the allocation of societal resources, as it is evolving in the for-profit sector, so as to bring it in congruence with the broader societal values, including those of human dignity, environmental preservation, and care for disadvantaged people. The for-profit sector needs to be supplemented by the non-profit sector not because of market failures, but because of its failure to take due account of the relevant societal values." An advantage of the proposed classification is that specific nonprofit theories may be assigned to several groups at the same time.

### Failure-Based Theories

Economic theories that seek to explain the existence of nonprofit organizations focus on the concepts of public versus private goods and the various "failures" that drive the demand for them (Salamon 1987). The first reconciliation of the persistence of nonprofit organizations with classical economic theory was offered by Burton Weisbrod (1977). His theory of government failure parallels the more established theory of market failure. Nonprofit organizations flourish when either, or both, "market failure" (for-profit firms have no interest in a good, or few trust that it can be delivered with equity and accountability) and "government failure" (the government cannot deliver a public good efficiently) have occurred. Weisbrod (1977) argued that the nonprofit organizations that were not motivated by making profits had goals that differed from the goals of profitable businesses and that those nonprofit organizations would not skimp on the quality or quantity of the services provided at the expense of poorly informed consumers. The advantage of the provision of those services by private nonprofit organizations, compared to profitable companies, lies, inter alia, in reducing the degree of the information asymmetry on the part of the consumer.

### Trust Theories

When focusing on "failures," Hansmann (1987, 1990) described a "contract failure" that posits that consumers prefer nonprofit organizations because governments fail to provide services to all, and for-profit businesses fail to offer assurances against exploitation. Hansmann introduced the label "contract failure" to describe the role of nonprofit ownership in markets with asymmetric information.

The preference for nonprofit service is driven by the trust that nonprofit organizations will deliver responsive and nonexploitative services and will not abuse information asymmetries. The "trust hypothesis" is based on the claim that asymmetric information in the markets for certain goods and services can explain the existence of nonprofit enterprise in those markets. Assuming that profit-maximizing producers might not have an incentive to deliver the quality of goods and services they promised consumers and/or donors.

### Supply-Side Theories

Another theoretical approach treats the unsatisfied demand for public goods resulting from state and market failures as a necessary but insufficient condition for the existence and importance of nonprofit organizations in a socioeconomic context. This supply-side theory argues that another condition is needed, namely, "the presence of people with an incentive to create NGOs to meet such demand" (James 1987). Nonprofit organizations benefit by access to economic advantages, including a reduced tax burden, the workforce contribution of volunteers, and access to government grants and private donations.

### Interdependence Theory

The welfare state theory, both failure theories (underlying the heterogeneity) and supply-side theories, "take as given that the relationship between the non-profit sector and the state is fundamentally one of conflict and competition" (Salamon and Anheier 1998). Nonprofit organizations also face failure if they cannot deliver results. Salamon (1987) noted that nonprofit organizations are hampered by four potential failures: insufficiency (they cannot meet needs), particularism (their activities focus on a limited constituency), paternalism (they set the agenda with little end user input), and amateurism (they do not have the capacity to effectively

manage programs). Nevertheless, close cooperative relationships can occur between nonprofit organizations and governments.

### Rurality Theory

A new theory to explain the role and existence of nonprofit organizations in the economy and society is the rurality theory. This theory, which is a type of market failure theory, was formulated by Vladislav Valentinov (2009) and assumes that, generally, the existence of the nonprofit sector is a result of the limited abilities of for-profit firms to satisfy human needs. Valentinov adds to this theory that there are specific characteristics of rural areas with specific human needs resulting in "rurality-specific costs." The rural theory's general hypothesis is that rurality-specific transaction costs led to the emergence of rural nonprofit sector organizations. Based on Valentinov's assumptions, the recognized empirical relevance and the growing political popularity of the rural nonprofit sector have not yet been matched by a corresponding development in nonprofit sector economic theories (Valentinov 2012).

# History of Korean Urban Development

Hyejin Wang and Chad David Anderson
Department of Public Administration, Incheon National University, Incheon, South Korea

## Synonyms

Joint redevelopment; Korean history; Urban development; Urbanization; Urban redevelopment; Urban regeneration; Urban renewal

## Introduction

The concept of urban development is broad, encompassing the formation and expansion of urban spaces (urbanization) as well as the expansion and elaboration of urban society and

economy (urban development), new development to replace old (urban redevelopment), making old urban spaces new (urban renewal), and the process of bringing dying urban spaces back to life (urban regeneration). A unifying element in urban development is the movement towards urbanism as a dominating value in society and the idea that development represents a sort of progress from less developed to more developed.

This chapter tries to see how that process has happened in South Korea. The nation has undergone a remarkable set of transformations in the past century, from the anti-Japanese independence struggle inaugurated 100 years ago through national liberation in 1945 to its status as one of the advanced economies of the twenty-first century. Korea moved from national division in 1945 through civil war in the early 1950s and a succession of authoritarian regimes up to the democracy movement of the 1980s and the current democratic system. South Korea went through a process of intense national development, massively pushing for state-led industrialization from the 1960s, then moving to liberalization of the economy in the 1990s, a debt crisis and IMF bailout at the end of that decade, and the current neoliberal economic order.

Through this time, all of these trends have been accompanied by urban development, first through urbanization and then also through development of already-urbanized spaces. Urbanization followed a pattern of inertia under the last dynasty, and then increased under Japanese rule as the economy was developed for integration into the modern Japanese economy. Urbanization then intensified following the Korean War and the destruction of much of the nation as displaced people and refugees poured into cities, accelerating their growth. Korea experienced dramatic urbanization along with economic development from the 1960s as the push for industrialization attracted people to move to take advantage of economic opportunity in the cities. South Korea became urbanized in the 1970s as the urban population moved past 50% and cities have continued to grow and develop since.

The push for reconstruction after the Korean War and the drive for national development began when South Korea was one of the poorest nations in the world. Therefore, it operated under the assumption that speed, efficiency, and economic development had to come before all else. The Comprehensive National Territorial Plan (CNTP) was introduced to develop both urban and rural areas in a balanced way to improve efficiency in utilizing territory for the safety and affluence of the public (Ministry of Land, Infrastructure and Transport 1971). This plan was initiated by combining with the First 5-Year National Economic Development Plan in 1962. This plan had huge impacts on urban development as well as overall land use. It left cities that were crowded, polluted, and planned without attention paid to parks, green space, comprehensive transportation, and local centers of entertainment. This left ample room for further development within cities, particularly through renewal, redevelopment, and regeneration.

Through all of this, the city of Seoul plays a unique and special role within the urban development process in South Korea. The city is even called a special city in Korea and has a special administrative and political status under South Korean law. Beyond that, however, the city holds a special place in the national culture and economy. The city's population accounts for about a fifth of the nation's population and the metropolitan area makes up about half. The city's dialect is the nation's standard dialect. Major media and cultural outlets are concentrated in the capital, along with a disproportionate number of the major universities. The nation's capital is also home to a disproportionate share of the economy and the nation's financial and economic resources. Prior to the establishment of Sejong City as a new administrative capital, central government organizations were located almost exclusively in Seoul. Even today, civil servants prefer placement in Seoul and those working for ministries located in Sejong are reported in the media as complaining about the physical distance of their ministry from the other centers of power in Seoul.

Seoul is also the urban government with the most resources and autonomy from the national government. All of these factors have led to the pattern of urban policy in Seoul being the de facto urban policy for the nation as other cities look to

trends in Seoul and follow them or as the national government sees what is happening in Seoul and makes national law and policy for the entire country in response.

This chapter will trace urban development from liberation to the present in South Korea and draw further conclusions.

## Liberation to 1950

The Joseon Dynasty of the 500 years before the Japanese annexed Korea in 1910 was ruled by a king and a class of *yangban* scholar-nobles and scholarly government bureaucrats who did not emphasize practical economic development. As a result, the drivers of urbanization had much to do with the capital and other cities as concentrations of state bureaucratic and military power rather than with economic development generated by commerce, trade, and industry. This led to cities that grew and developed, though more slowly than they may have under a government that stressed economic development.

The Japanese upended these concerns and stressed economic development, though the priorities were skewed in the direction of integrating Korea into the Japanese economy for the purpose of meeting Japan's economic needs. Liberation and national division between North and South threw this system into chaos. The natural growth of urban areas under Joseon and the Japanese continued through a process of inertia though most people stayed in rural areas and the rural way of life was the common style.

At the same time, the Japanese largely left Korea to return to Japan. Industry and manufacturing were disproportionately concentrated in the North and agriculture was concentrated in the South, and both were structured to serve Japan with raw materials and food. The end of the Japanese Empire thus left many people stranded in places that no longer made economic sense and people shifted to find new economic opportunities. Meanwhile, the creation of competing political regimes and eventual separate nations also found many people on the wrong side of a border that had never before existed, leading many right-wing and wealthy individuals to move south while many left-wing advocates moved north. These migrants left rural and urban places they abandoned all over the nation, while mostly relocating to major urban centers, particularly Pyeongyang in the North and Seoul in the South.

## 1950s

As the Korean War broke out in 1950, the suffering and destruction it wrought laid a new basis for urbanization. Most of the capital area was repeatedly fought over and leveled. Large numbers of refugees fled the fighting in the central part of Korea and concentrated around the southern port of Busan, the main port for landing UN/US forces and supplies. Busan remained under South Korean control throughout the war and swelled in size as a result. It provided a safe haven from the war and, with ships coming and going, it provided an escape route for those leaving the country. It also provided economic opportunity for people working for the government and for the UN/US forces.

After the end of the war, displaced people moved from all over the country back into urban centers looking for work and housing. This pseudo-urbanization expanded cities and increased the population of urban areas, though it did not change social patterns in the way that later urbanization would.

Before, during, and after the war, most people moving into the cities concentrated in unauthorized shantytowns where they did not have title to the land. These shantytowns often became urban slums as more people came from rural areas, outstripping available economic opportunities. Due to the destruction of the war, these shantytowns and urban slums were often located on attractive plots of land near the city center that had been cleared by waves of fighting. Seoul included major shantytowns around the Cheonggye Cheon and other streams as well as along the banks of the Han River flowing through the center of the city. These included areas that would later become prime real estate.

The response of the government to these developments included slum clearance policies that would endure for decades. Although the government attempted a trial welfare housing project to draw people out from slums, this was short-lived

and the major urban development effort involved clearing unauthorized shantytowns and urban slums. Slum clearance provoked the resistance of residents. With an authoritarian government that lacked outlets where shantytown residents could complain, resistance became physical so the pattern quickly developed of soldiers forcibly clearing people from their homes. The soldiers were then immediately followed by bulldozers from companies that would then build on the land. This process of resident eviction and shantytown clearance was common in Korean cities and opened up much of central Seoul to development.

### 1960s

A military government took power through a coup d'état in 1961. The military government put its priority on economic development and launched the First 5-Year National Economic Development Plan in 1962. This plan initiated a planned industrialization of the Korean economy, with urbanization following industrial developments concentrated in cities.

The rural population increased but urban population growth accelerated and outstripped it during this decade. The absolute rural population started to decrease in 1968 (Cho 2010). Labor-intensive light industry was a major driver of economic development in the 1960s. Rural people suffered from hardships and came to cities for jobs as the government controlled agricultural prices to keep them low for export. The government implemented policies to control the massive population influx into cities from the countryside during this period. The policy proved to be ineffective; however, as industry flourished around Seoul and economic development attracted people to move to cities in general to search for jobs (Lee et al. 2011).

Government developed plans to relocate residents of illegal urban slums by legalizing their residences through a system of apartment options. However, people living in slums were not able to afford new housing. As a result, eligible residents mostly sold their housing options to those who could afford them and then moved to other areas. They were ousted to the periphery of the city and made other slums there (Lee and Anderson 2013). There were also protests by residents against government eviction and displacement.

Gwangju Daedanji was the first major organized protest movement of the urban poor. The Park Chunghee Administration enforced a rehabilitation policy in 1969 in order to move urban poor living near the Cheonggye Cheon stream and Yongsan in Seoul to Gwangju in nearby Gyeonggi Province. The government promised housing and jobs for the poor but provided no infrastructure once people moved to Gwangju. In addition, land prices soared and the poor were asked to pay much more for housing, prompting demonstrations. The protests ended after 3 days and government accepted the demands of the organized residents' committee. The negotiations did not resolve the suffering of the poor, though.

The previous slums were replaced by modern commercial architecture when the government built the Sewoon Electronic Complex located along the Cheonggye Cheon in Seoul to replace shanties along and near the stream. It was the first complex of buildings with apartments and stores in South Korea and covered all types of electronic products until the 1990s when the digital industry started to develop.

### 1970s

Population relocated faster as an expressway linking Seoul and Busan was constructed from 1968 to 1971. This expressway polarized populations, with people concentrating in the capital area and the southeastern area, including Busan and Daegu (Cho 2003, 2010). People also concentrated in Daejeon, Incheon, and Gwangju. Seoul and the capital region developed export-oriented industry while the southeast, previously known for light industry, started developing chemicals and heavy industry. Urbanization accelerated during this decade, reaching 52% in 1977 (UN World Urbanization Prospects 2018).

The first Comprehensive National Territorial Plan (CNTP) was announced in 1971, covering next decade from 1972 to 1981. It adopted a nodal system that meant certain central cities in each region were designated to lead development of the region. This was done because both

population and economic development were already polarized as they were concentrated in the two major cities of Seoul and Busan. The plan emphasized more balanced territorial development. To do so, the government divided the national territory into eight regions: the Capital area centered on Seoul, an area centered on the city of Taebaek in northeastern Gangwon Province, an area based on the west-central North and South Chungcheong provinces, an area centered on the city of Jeonju in southwestern North Jeolla Province, an area centered on the city of Gwangju surrounded by southwestern South Jeolla Province, an area centered on the city of Daegu surrounded by the southeastern North Gyeongsang Province, an area based on the southeastern city of Busan, and an area covering the southwestern island of Jeju.

Regulations were drafted to specify site usage according to purposes announced by law in order to promote balanced development. Green belts were designated to control reckless development. CNTP was implemented to develop each area based on its natural resources and economic function. Since it was the first plan, most of the projects covered built infrastructure for further development. As a result, the area designated as industrial sites increased 3.3 times from 102 $km^2$ in 1971 to 332 $km^2$ in 1980. Highways were built connecting and crossing the eight areas. Dams were constructed to supply water for residential and industrial uses. However, the effect did not result in more balanced development. By the end of the first CNTP, Seoul accounted for 22.3% of the whole population of South Korea.

During this period, housing protests continued as most residents were not able to afford to buy an apartment when given a housing option to encourage relocation when slums were cleared. People formed new shantytowns in other areas once they were evicted from their original residence. This pattern had the effect of igniting a civil movement to address the housing problems of the poor.

For example, Bogeumjari originated from urban slum removal in the 1970s. As government cleared slums near the Chenggye Cheon, people lost their homes and moved on to Yangpyeong-dong but were not able to establish stable residences there. A number of people decided to create their own village and community called Bogeumjari supported by funds from Catholic and German aid organizations. About 170 households relocated from Yangpyeong-dong in Seoul to Sincheon Village in neighboring Gyeonggi Province (Korea Democracy Foundation 2014). Ultimately, people from Sillim-dong, Siheung-dong, and Bongcheon-dong in Seoul came to Bogeumjari Village where people built houses by themselves and made an affordable economic community and realize democracy. Its success became a model for other cases.

### 1980s

The second CNTP covered the period from 1982 to 1991 which covered the fifth Republic of following a military coup in 1980, the democracy movement that opposed it, and the present sixth Republic following democratic elections in 1987. The second CNTP had multiple goals building on the foundation of the first CNTP. The second CNTP wanted to encourage population growth outside of the capital area to address the continuing concentration of population in Seoul and Busan with the related goal of expanding development potential across the whole nation. The plan also had the goals of improving citizen welfare and preserving the environment (Ministry of Land, Infrastructure and Transport 1981). It divided the national territory into 28 living areas that included a few central cities for development. However, in contrast to the stated goal of balanced development, this goal was undercut by an emphasis on efficiency in development to maximize scarce resources.

The pace and scale of urbanization was intensified as heavy, chemical, and export-oriented industries were emphasized. The decade started with 56.7% of the population in cities but the proportion reached 72.1% by 1989 (World Bank Data 2018). The new electronics industry sprang up in the early 1980s and the capital area grew even more based on the new high-tech industry. Big cities outside of the capital area such as Cheongju (the capital of central North Chungcheong Province), Daejeon (west-central), Gwangju (southwest), Jeonju (capital of southwestern North Jeolla Province),

**History of Korean Urban Development, Fig. 1** Urbanization Rate of South Korea, 1950 to 2019. (Source: KOSIS)

and Ulsan (southeast just north of Busan), along with small- to medium-sized industrial cities grew rapidly while the southeast focused on chemicals but heavy industry showed less growth by comparison (Cho 2003) (Fig. 1).

Government planned and implemented the First New Town policy in order to address housing problems in the capital area, diffuse population and industry, and improve transportation and the environment (Lee et al. 2011). New cities were constructed within an hour's distance of Seoul, including Anyang, Gunpo, Bucheon, Seongnam, and Goyang. These cities simply functioned as bed towns in the beginning but came to attract business and have their own economic functions beyond successfully providing housing for the capital region. On the other hand, the policy was criticized as reckless land development as well as for further concentrating development in the capital region (Lee et al. 2011).

Government also initiated joint redevelopment, jointly involving government, construction firms, and housing owners. While the policy significantly expanded participation in urban development by including anyone in a redevelopment area with the title to their home, the majority of residents who did not have a title were not able to express their opinions, and were ignored, sometimes resulting in massive protests. These cases included Sanggye-dong in 1985 and Mok-dong in 1986.

The South Korean government hosted the Asian Games in 1986 and the Olympics in 1988. The government prepared for these events by clearing slums with mass evictions by force for the purposes of realigning, cleaning up, and beautifying the city. Sanggye-dong and Mok-dong were both targets for clearance. Government asked people to leave by giving them a small subsidy and priority tickets for purchasing replacement housing. However, it did not provide much help for the people asked to leave so a large number of people demonstrated against the policy. The discontent added to a larger movement against the narrow top-down orientation of redevelopment policy where the priorities for development were decided by narrow elite government and business interests without a voice for the urban poor who paid the cost of displacement throughout the city. The protests in Sanggye-dong and Mok-dong provoked a crisis in each case that lasted for months, though residents were dispersed in the end. Some of the people evicted from Mok-dong moved to Bogeumjari.

### 1990s

The third CNTP was announced in 1991. It covered the decade from 1992 to 2001. The first two

CNTPs did not succeed in addressing regional imbalance and population across the country became even more seriously polarized and the imbalance intensified. Environmental pollution was raised as an issue during this period. The population of the capital area accounted for 42.7% of the national population, which increased difficulties related to transportation, housing, pollution, and crime. Consequently, the third CNTP was initiated to control concentration in the capital area and develop outside the capital area by moving government agencies and structuring tax incentives. This coincided with the beginning of elected local government independent of the national government through a new system of local autonomy. Culture and leisure started to be emphasized as living standards increased with rising national development. Direct connections were made with North Korea and building infrastructure for unification started becoming a topic for discussion.

Urbanization matured and the rate reached 75% in the 1990s with the rate of increase slowing. Cities with a population over a million showed less growth while medium-sized cities expanded. This did not decrease population concentration as these were mostly cities near Seoul such as Suwon, Seongnam, Bucheon, and Anyang. On the other hand, small cities with less than 200,000 people lost population. The noticeable imbalance between the capital region and the rest of the nation grew worse. Though cities in the capital area in general kept growing, there was imbalance there as well. Sprawl appeared as housing and other lower-density functions were diffused to medium-sized cities in the region. Green belts were used to help limit sprawl and contain growth around metropolitan cities.

The decade began with the first elections for local councils in 30 years. With the beginning of local autonomy, local governments were given independent authority to implement their own development policy so smaller-scale policies and projects joined the massive nation-wide policies. New partnerships were formed between companies and civil society to conduct urban development policy. At the same time, joint redevelopment became more active, widespread, and brought about wider participation in urban development to supply more housing, particularly in the capital region. A majority of housing owners in an area would approach a construction company and form a joint corporation to split the profits from redevelopment. Approval of projects brought opportunities for business and future tax revenue for local government. Even so, the opinions of residents continued to be neglected, particularly among those without title to land. The process generated substantial housing, though the biggest profits were to be had in high-end housing, leading to a growing imbalance as low-income residents were not able to afford the housing options available to them. Protests continued.

Local autonomy prompted local governments to take a more active role in developing their own brand for purposes of urban development. For example, Bucheon, originally designed as a satellite city of Seoul, set a long-term plan from the beginning of local autonomy to become a cultural city (Anderson and Wang 2018). The city hosted the first Bucheon International Fantastic Film Festival in 1997 which is the most famous of its cultural festivals that also include the Bucheon International Animation Festival and the Bucheon International Comics Festival. These have been ongoing and growing and have contributed to substantial new development in the city. Bucheon has become known in South Korea as a representative cultural city.

### 2000s

Urbanization reached 90.8% in 2009, with nine of ten people living in cities (Korean Statistical Information Service 2018). The Second New Town Policy was implemented in 2000. Government designed this policy to solve problems raised by the First New Town Policy and to supply more housing in the capital region (Lee et al. 2011). The capital region continued to grow and expand as resources as well as population became more concentrated in the area. The imbalance between the capital region and the rest of the country became more serious. Combined with a decreasing birth rate, the rest of the country had even fewer working-age people. At the same time, economic competition had intensified after market

deregulation in the 1990s as well as the restructuring following the IMF bailout in the wake of the "Asian Flu" currency crisis of 1997. Areas that were not able to compete on the new economic terrain went into decline. This intensified aging and recession in rural areas outside of the capital region.

In 2004, the Roh Muhyeon Administration suggested moving the capital from Seoul to a new city called Sejong in the middle of the country to promote balanced development. However, the Constitutional Court rejected the law covering the move as unconstitutional. The compromise was that Seoul would remain the permanent capital with the presidential Blue House and the National Assembly while Sejong City would become the administrative capital housing other government offices.

The Kim Daejung and Roh Muhyeon administrations addressed ongoing urban redevelopment protest through lengthy negotiations that decreased the violence that had often been associated with intense urban conflicts over evictions in redevelopment zones. The Seoul Chief of Police under the new Lee Myeongbak Administration authorized direct action to overcome a building occupation on a major artery in the center of Seoul, resulting in the deaths of five protesters and one police officer. This led to a widespread search for ways to deescalate housing conflict and to Seoul Mayor Oh Sehoon suspending all ongoing projects (Lee and Anderson 2013).

Culture was raised as a new force for development. Seoul led cultural and environmental urban development under Mayor Lee Myeongbak and his successor, Mayor Oh. Urban regeneration was advanced as a new paradigm for revitalizing deteriorated parts of cities physically, culturally, and in environmentally friendly ways making use of existing resources. Mayor Lee advanced a "New Developmentalism" to improve the urban environment of Seoul while meeting the needs of residents. A highway overpass was removed and traffic restructured to restore the Cheonggye Cheon stream passing through the central part of Seoul. The stream had been covered and become a de facto sewer but was restored to create green space and improve the environment at the center of Seoul. Merchants displaced by the project were removed though the mayor's office and the mayor personally were actively involved in resolving conflicts. Though also criticized for cost overruns, the project contributed to making a landmark that helped Seoul become recognized as a global city (Lee and Anderson 2013). Mayor Oh put in place the policy of "Culturenomics" as a new urban development paradigm to use culture to develop the city on a smaller and less expansive scale and succeeded in getting the city named as an international design capital (Lee and Anderson 2013). The central role Seoul plays in urban development in South Korea means that these policies had an impact around the nation.

### 2010s

Mayor Oh's cultural policy stopped as soon as he resigned and his successor Mayor Park Wonsoon was elected on a promise of advancing urban welfare and citizen participation. Mayor Park stressed free school lunches and cutting tuition in half at Seoul municipal colleges and universities in his first term. However, his "Platform Administration" paradigm in his second term included urban regeneration to revitalize old urban areas not only physically but also culturally.

The Seoullo (Korean for "Seoul Road") project opened in 2017 and recycled a 40-year-old overpass going by in Seoul Station into a pedestrian park to attract more visitors to and serve the area. Modeled after the High Line in New York and other similar urban projects, it was designed to link old and declining areas near Seoul Station to bring visitors to those neighborhoods. The major conflict during the project seemed to involve a lack of trust of the city. Even though part of the purpose of the project was to attract visitors to the area, merchants from Namdaemun Market near one of the entrances were afraid that the number of visitors to the market would decrease once construction began and required greater inclusion in the process before they gave their assent. Though the Seoullo project was constructed according to Platform Administration, the distinction between it and earlier paradigms was not totally clear.

Other local governments have tried an urban regeneration approach and the Moon Jaein campaign also advanced urban regeneration as part of his platform and has been working on it in his presidency. However, it is unclear the extent to which urban regeneration represents a set of different urban development mechanisms (like Seoullo) or is more a new way of modifying or branding existing urban development mechanisms. For example, the central government announced plans for a new Third New Town Policy in December, 2018.

The government announced the Third New Town Policy would address transportation problems and the excessively high density of development in the capital region. However, it allows for expansion of the capital region in the name of reducing density so there is indication that this may not be for solving over-concentration but more for continuing the status quo.

## Conclusion

South Korea has undergone a remarkable transformation from being one of the poorest nations at liberation into one of the leading economies of the twenty-first Century and one of the most urbanized nations in the world. Even so, the nation's cities still face a number of major issues. These include global competitiveness, the imbalance between the capital region and the rest of the nation, an imbalance between an excess of luxury housing and a lack of affordable housing, and uneven development including overconcentration choking off growth versus urban decline. In addition, there remains traffic congestion, pollution, and the need for a sustainable transformation of the urban environment.

These problems have been addressed, along with the nation's political development from authoritarianism towards increasing democracy, with methods that have gradually followed the same trajectory from more authoritarian, unilateral, and centralized to more participatory, broader, and more decentralized. Methods stressing efficiency have gradually given way to processes that try to balance interests and respect rights. Development at any cost has given way to paying attention to the human and environmental costs. The first CNTP was written so that concentration in the capital area and the problems that resulted should be addressed within the capital area, reflecting the perspective of governments dealing with this issue. This perspective has continued through the CNTPs and laws related to development. As a result, concentration in the capital area and related problems remain unsolved. Old methods did not completely disappear once established but have been modified and updated. At the same time, new methods have been added to supplement the old ones where they could not be modified to meet evolving concerns, needs, and interests.

# History of Organizations

Shugo Shinohara
School of Public Affairs and Administration, Rutgers University, Newark, NJ, USA

## Synonyms

Associations; Evolution of organizations; History of institutions; Management system

## Definition

The general history of a group of people who work together in an organized way for a shared purpose.

## Introduction

The history of organizations describes an evolutionary flow of the methods by which human beings structure the activities necessary to their survival. Organization is essential for human activities that provide the basic physical needs of food, clothing, and shelter. Under conditions of chronic change, humanity has endeavored to develop the most effective method of organizing these activities to compete for survival and meet the challenges of a particular era. The rise of organizations is marked by the constant adaption to changes in the technological, cultural, political, and economic environments. The story of the historical changes in the form and nature of organization is inevitably linked with the current changes to organizations, which are occurring in a more accelerated fashion than ever before.

## Early History

In the early stages of human history, organization was confined through simple tasks involving the most basic human needs: food, clothing, and shelter. As a mean of increasing the food supply, prehistoric people organized foraging and hunting activities and, later, agricultural activity as well. The transition from the anarchy of hunting, gathering, and horticultural societies to the first agricultural civilizations, with cities and states, began approximately 6000 years ago. Historians have long argued the primal cause for the emergence of large-scale social organizations. Karl Wittfogel (1956) presented an influential theory that the development of irrigation projects in such areas as Mesopotamia and Egypt led to the use of mass labor. In these semiarid areas, village farmers suffered from unstable water supply with small-scale irrigation. This shared concern drove autonomous villages to merge into a single large political unit of carrying out irrigation on a broader scale. Irrigation brought a surplus of food, which enabled some individuals to divorce from food production and to become potters, weavers, and masons, thereby creating a division of labor in ancient cities. Wittfogel's theory, however, has been modified by some scholars who argue that the formation of cities and states was a response to several factors including geographical features, distribution of natural resources, and relations with neighboring communities (e.g., Carneiro 1970).

## Middle Ages

Given a more stable food supply, populations expanded and the power of the central authority continued to grow through feudalization from antiquity to the Middle Ages. Cities were the large centers of settlement where more people

were disconnected from subsistence activities and carried out such functions as administration, production, exchange, and religious ceremonies (Carneiro 1974). Although diverse forms of organizations for different purposes appeared in these cities, the growth of commercial organizations was remarkable in terms of scale. This growth was coupled with advances in technology during the Middle Ages. Of central importance was the application of wind power and waterpower, which marked the beginning of the replacement of human labor with the power of machines.

The cloth industry is one of the best examples to illustrate that technology changed the nature of work and led to large-scale production in the Middle Ages. Up until the thirteenth century, the fulling of cloth had entailed trampling the cloth or beating it with wooden hammers. Such time-consuming processes were carried out within the farming household. The invention of the fulling mill using waterpower allowed only one person to keep the cloth moving in a trough. The mechanization of fulling led home manufacturers of cloth to live along streams, promote the concentration of workforce, and organize the production in a larger scale. Mechanization also advanced the specialization of labor in the Middle Ages. In the large-scale metal mining industry, there was a hierarchy of clerical and technical personnel and craftsmen and mechanics who specialized different phases of the mining operations. For instance, various types of pump, such as crank-operated, treadmill-operated, and water-powered, were used for mine drainage, with each type operated by specialized mechanics. Large-scale production and the specialization of labor represent the genesis of the factory system.

## Industrial Revolution

The steam-driven machinery introduced in the eighteenth century led many industries to transform from the old handcraft tradition to the factory system. The mechanization coupled with the factory system further promoted the specialization of labor. In his seminal book *The Wealth of Nations*, Adam Smith (1776) described the new production process in a pin factory: "One man draws out the wire; another straightens it; a third cuts it; a fourth points it; a fifth grinds it. . ." Smith wrote that a single worker could not certainly make 20 pins in a day, whereas these new methods enabled a pin factory to produce 4800 pins a day. Unlike the medieval home manufacturing, the increase in productivity depended far more on the organization of the production process rather than individual skills. This led to the use of more inexpensive labor such as women and children especially in the early textile factories.

The high cost of machinery created a hierarchy between the owner of machines and the employees who operated them. The owner often placed the workers, especially women and children, under strict working conditions with long labor hours set by the pace of the machines. In the early textile factories, the workers spent 14–16 h every day to perform repetitive tasks in noisy, foul-smelling, and unsanitary environment. The workers' homes were unhealthy. It was at this point that labor unions began to form. Labor unions organized strikes and negotiated with employers for better pay and working conditions. During the Industrial Revolution, such union activities grew larger in scale and often became more violent. This led governments in Europe and the USA to enact labor laws and safety regulations from the late eighteenth to the mid-nineteenth century.

The factory system contributed to the growth of urban areas. A large number of peasants and home manufacturers migrated from the rural areas into the cities in search of factory work. For instance, London had a population of one million in 1801, which doubled by 1851. Large-scale urbanization required governments to expand their roles by facilitating infrastructure development, opening schools, and providing health services and water facilities. Urbanization during the Industrial Revolution set the premise for the subsequent era of mass production and consumption.

## From the Mid-Nineteenth Century to World War II

Some scholars identify the 1870–1914 period as the "Second Industrial Revolution." Given the rapid population growth, the innovations during this period advanced mass production –

the method of producing identical goods in large quantities at a relatively low cost per unit. Mass production was further expanded by the large-scale demand for standardized, uniform products during the first and second world wars.

The development of machine tools enabled a small workforce to precisely cut and shape hard metals at low costs, which was essential in the mass production of standardized goods. The new system of manufacturing coupled with these precise tools and equipment dramatically increased productivity. Henry Ford, the American automobile manufacturer, designed a revolutionary assembly line that reduced the manufacturing time of the chassis under the old system to half. The core idea of this innovation was to break down complex tasks into simpler ones using specialized tools. In addition to expediting the process, simpler tasks created interchangeable parts in factories. This allowed an assembly line to increase adaptable flexibility and meet the changing needs of the product. Ford's method was named Fordism and spread throughout American industry.

By the early twentieth century, the theoretical approach to organization management had been elaborated. American industrial engineer Frederick Taylor (1911) advocated a new management approach – scientific management. Taylor believed that the role of factory managers was to detect the most efficient way for workers to do a job, to provide the proper tools and training, and to increase incentives for good performance. To pursue efficiency in a work process, Taylor suggested the use of scientific principles and measurement. Taylor broke down each job into its constituent motions, timed the workers' motions with a stop watch, and analyzed these motions to determine which were essential or redundant. Taylor's scientific principles were named Taylorism, and these have been further developed by his followers ever since. Both Fordism and Taylorism represent the advancement of systematic approaches to organization management in the early industrialization.

Although scientific management was being widely applied in American industry, it was often the subject of criticism. Labor unions became powerful agents who present complaints on behalf of workers, who were subjected to an accelerated work pace, lower standards of workmanship, and lagging wages. Some scholars also fueled the criticism against scientific management that treated workers like machines. American social scientist Elton Mayo (1933, 1945) conducted a series of experiments in a plant and offered evidence that better working conditions, such as lighting, temperature, rest periods, and wages, increased productivity. Mayo explained that such better treatment made the workers feel an important part of their job or company, thus improving productivity. Mayo's findings led his followers to seek various means of improving workers' motivation and productivity. These are the basis of contemporary human resource management.

## Post-World War II

Following the end of World War II, a global economic expansion occurred in the 1950s and 1960s. Unlike the prewar industrialization, which centered on the UK and USA, the high economic growth during this period was enjoyed particularly in the countries devastated by the war, such as Japan, Germany, France, and Italy. Advances in technology during the wartime, including telecommunication, computing, and jet engines, largely contributed to this worldwide economic boom.

Although the process of economic growth differed in individual countries, the rise of the service sector was a common trend throughout the twentieth century. In the USA, for example, the number of workers in the service sector in the 1950s exceeded those in the manufacturing industry and this proportion increased thereafter. The service sector is marked by diversity. It includes truck transportation, hospitals, business consulting, internet providers, and public agencies that engage in education, health care, and security. Unlike the mass production of identical goods in industry, these organizations are required to respond to individual needs in a timely manner. Management theories in the twentieth century suggest that decentralized structures and flexible

work boundaries are advantageous for service organizations rather than hierarchical and strict divisions of work (e.g., Gronroos 1990).

Under the growing trend of globalization, public and private organizations have been more intertwined across national borders than ever before. The New Public Management (NPM) movement in the 1980s and 1990s led the worldwide transition of public organizations. The core assumption of NPM is that the application of business models to the public sector increases efficiency in public goods and service provision. NPM emerged in the UK under the leadership of the Prime Minister Margaret Thatcher, who attempted to introduce market mechanism into public service delivery through reforms such as privatization, contracting out, and performance measurement. This NPM movement first spread to other European countries and North America and then expanded to Africa, Asia, South America, and other regions by the late 1990s. NPM remains influential on the argument regarding the appropriate form and nature of public organizations. This ongoing movement has obscured the distinction between public and private organizations in a global scale.

## Conclusion

The history of organizations presents the sequential efforts of human begins to adapt to environmental changes led by politics, economics, culture, and technology. On the one hand, it reveals the unaltered nature of humanity to confront challenges in an organized way. In the twenty-first century, most emerging issues in organization management, such as diversity, information technology, and the growing demand for specialized services, have been shared between both public and private organizations across countries. Given the accelerated fashion of globalization and technological advancement, the importance of networks linking organizations and organizational change have been emphasized in recent management studies. Individual workers in contemporary organizations are also required to gain more diverse skills, such as leadership, communication, and computing, compared with those in the Middle Ages and the Industrial Revolution. Beyond the discrepancy between the old and modern circumstances, however, organizations have been at the core of human life throughout history.

# History of Procurement in Public Sector in Russia

Nadezda Demina

South Ural State University, Chelyabinsk, Russia

## Synonyms

Contracting out; Outsourcing; Products supply for state needs; Public tendering

## Definition

The process of obtaining goods and services for public agency that includes preparation and processing of a demand as well as the end receipt and approval of payment.

## Introduction

Carrying out economic activities requires material resources. Under market conditions of economic management, a purchaser of resources is motivated to buy goods with the optimum "price-quality" ratio; however, if a customer of products and its consumer are different subjects, there is a problem of effective procurement management. In the world practice, there is a developed procurement system that allows to meet the demands of the customer in the process of procurement to the greatest possible extent. Improving terms of a contract for resources supply for the customer is achieved by creating conditions for competition between suppliers.

## Products Supply for State Needs in Pre-revolutionary Russia

Historical archives still retain data on the first documents related to supply organization for state needs, as such a document historians name the Decree of Tsar Alexei Mikhailovich, dated July 7, 1654, on the contracting price to ensure supply of breadcrumbs and flour in Smolensk city. The basis of the purchasing system functioning in Russia was formed by Peter I, when the special department called the Chancellery of contract works, subordinate of the Senate, was formed.

The closest to the modern understanding of the regulation of the state order system was a document which was in force in 1900–1917 "Regulations on treasury contracts and supplies." Such elements of procurement system as mandatory bids, advance payment from the customer, the possibility to involve subcontractors in performance of a contract, as well as basic concepts about contract performance security in the form of pledge or warrantee appeared that document (Belov V.E. Supply of goods, works and services provision for state needs: legal regulation - M.: Norma, Infra-M, 2011).

## Procurement in Russia in the Soviet Period

The economy of Russia in the Soviet period was functioning on the principles of so-called command administrative system; under these conditions, the formation of economic relations was centralized, i.e., the central government determined the amount and destination of products supply. As a concept competing was absent, the pricing system was functioning outside the market mechanisms, so it can be stated that procurement did not exist in Soviet Russia. This thesis is also confirmed by the information about methods of determination of import production supplier for needs of the Soviet Union. Determination of supplier depended not on procurement efficiency criterion, but on political considerations; the priority was given to the countries of the socialist bloc (State order in Russia and Altai: history, development, prospects/edited by Eng.Sc.D., Prof. M.P. Shchetinin. – Barnaul: Azbuka, 2007. – 140 p.).

## Market Economy Establishment in Russia in 1991–1996

Significant problems of the planned economy development of the Soviet Union in the early 1990s resulted in a serious consumer crisis; aggravation of goods deficit problem was caused by the release of information about price liberalization in October 1991. Fear of hyperinflation and lack of goods in shops impelled people to quickly buy all products delivered to the stores. Companies of the country were in the process of changing the form of ownership: it was necessary to turn from widespread state property to private property. Continuing to carry out economic activity demanded establishment of products supply chain on a market basis, but one of the essential characteristics of

a market economy is the existence of goods producer competition, whereas at the beginning of the 1990s, there was no competition on most markets. It was impossible to implement any procurement elements because apart from the lack of competition, there was the acute problem of insufficient amount of money supply, which was solved by barter system. As there is no way to satisfy state needs by barter, in the context of the emerging market foundations of public procurement, system formation was laid. One of the first documents regulating public procurement was the Law of the Russian Federation No. 2859–1 "On the supply of products and goods for state needs," dated May 28, 1992. In order to clarify the provisions of the law, the RF Government Decree No. 638 "On the organization of work for the implementation of the Federal Law" "On supply of products and goods for state needs," dated August 27, 1992, was enacted. Paragraph 7 of this Decree indicated the following: "State customers shall ensure competitive placement of orders for goods supply for state needs by holding open and close bids, tenders and competitive tenders." These documents were in force until the adoption of the Constitution of the Russian Federation in 1993; during 1994, legislation was revised for compliance with the new constitution. The new basic law regulating public procurement was adopted in December 1994 "On products supply for federal needs» No.60-FZ dated December 13, 1994. This legislative act with numerous amendments is effective up to the present day (2016); it establishes the general principles of federal state need satisfaction; still, there are no clear requirements to the placement of orders through a series of mandatory procedures in the law.

## Decree No. 305 as an Important Stage of Reforming the Public Procurement System

The first document developed on the basis of international procurement principles in Russia was the Decree of the President of Russia No. 305 "On urgent measures to prevent corruption and reduce budget expenses during organization of production purchase for state needs," dated April 8, 1997. This document for the first time introduces mandatory placement of orders at the expense of the state budget and extrabudgetary funds on a competitive basis. The Decree No. 305 approved "Regulations on the organization of goods, works and services procurement for state needs," which regulated the procedure of the competitive tender based on the principle of openness and equality of bidders. The announcement of bidding procedures to be mandatory is a significant step toward the formation of a civilized market; however, because of the nature of business mentality, the real situation in the field was far from fair competition among suppliers. One of the major reasons for this situation was the lack of sanctions for failure to comply with the provisions of the Decree No. 305. Attaining the purpose of corruption prevention, identified in the title of the decree, at this stage of economic development, was impossible; nevertheless, admission of this problem appeared to be an important step toward creating an effective public sector.

## Step Back with the Law No. 97-FZ "On Competitive Tenders for Placement of Orders for the Goods Supply, Works Performance, Rendering Services for State Needs," Dated May 6, 1999

The document adopted at the end of the 1990s puts the development of the order placement system a few steps back. A significant number of laws enacted in that period were distinguished by complexity of unambiguous interpretation and contradictions in the statements contained in various documents, resulting in a lack of progress in economy reforming. However, this document is characterized by deficiencies stated in the text that could not but have an impact on the process of reforming the order placement system. The main downsides of the Federal Law No. 97-FZ are the following:

- Nonobligatoriness to place orders on a competitive basis.
- A limited number of customers falling within the scope of the law: federal executive body.
- Exclusion of trade organizations from the list of potential suppliers.
- Lack of criteria for determining the winner of the competitive tender in the law that undermines the sense of the procurement system.

## Start of Creation of a Civilized Contract System with the Federal Law No. 94-FZ "On Placement of Orders for Goods Supply, Works Performance, Rendering Services for the State and Municipal Needs," Dated July, 21, 2005

In comparison with the previous law No. 97-FZ, the Federal Law No. 94-FZ can be considered a breakthrough in reforming the order placement system; there are several reasons to confirm that, namely:

- The law has an effect on all market participants funded by taxpayers, including the municipal level.
- The scope of regulation of the law included a variety of ways to place orders both competitive ones like a competitive tender, an auction, a request for quotations, and single source purchasing.
- The law sets clear requirements to the organization of the order placement procedure based on competition protection and the principles of openness and transparency.
- The law introduced the criteria for determining the winner.

The critical disadvantage of the order placement system during operation of the law No. 94-FZ is the lack of the purpose to organize effective functioning of public sector resources; the main purpose of the introduction of strict regulation of order placement procedures and reporting was to prevent corruption while spending budget funds. Along with the law No. 94-FZ, the Code of Administrative Violations imposed a significant number of sanctions; the system of violation detection and punishment judgment was developed.

The Federal Antimonopoly Service played one of the main parts in the development and implementation of the Law No. 94-FZ, which even more distracted from the main purpose of the purchasing system functioning and substituted it with purpose of competition promotion. Of all the methods of purchasing, the competitive tender was the only option which allowed to use as criteria for determining the winner not only price but qualitative characteristics of products purchased. However, in practice, there were situations when the bidder lodged an application; his qualitative characteristics were unanimously assessed by the commission at a zero rate, while he became the winner, because the main criteria weight was given price. Later, with the adoption of the new Law No. 44-FZ, anti-dumping measures were established, which allowed to exclude such a situation. The possibility of using the competitive tender as a method of order placement was highly restricted; if the goods, works, or services fell into the auction list (the RF Government Decree No. 236-r "On the list of goods (works, services), placement of orders for supply (execution, rendering) of which is carried out through an auction," dated February 27, 2008), then their purchase by the competitive tender was forbidden. Consequently, in most cases, the price was declared the main criterion for purchase, whereas the opportunity of customers to establish permissible characteristics of the goods purchased was limited, in particular, a ban on the use of brand was imposed. Perhaps, if there were no peculiarities of Russian mentality, consisting in internal motivation to cheat the state, implementation of the Federal Law No. 94-FZ would lead to budget expenditure reduction and corruption decrease. Unfortunately, it did not happen. In spite of the announced price minimization criterion, the situation when in the framework of the state or municipal contract products purchased at prices higher than the average ones was ubiquitous. The most common cause of this situation was the absence of real competition among the suppliers; all the

bidders lodged an application, offered the price higher than the market price, and among them was chosen the bidder who offered the lowest price. Significant impact on the effectiveness of public purchasing had a motivation of entrepreneurs to increase their market share. In general, vivid, result-oriented personalities move to Moscow and other big cities; in small towns and villages entrepreneurs stay who tend to be satisfied with total revenue of their business, and they often refuse to participate in the system of state and municipal orders. The most serious problem was the lack of electronic platforms to place orders, when municipal bodies placed an announcement about products purchased in local printed issues.

Another significant disadvantage of the Law No. 94-FZ was the lack of regulation of such an important stage of purchasing as the contract execution; the technology of acceptance of goods and matching with those stated in the contract were developed by each customer on his own, which often had a negative impact on final services recipients, for example, the supply of infant food of low quality that provoked children allergic reactions. In the field of construction, works purchase under the criterion of price minimization often had disastrous effects; the use of the cheapest materials in construction led to impossibility of subsequent operation of an object commissioned.

## Modern Contract System in Russia

The modern stage of reforming the purchasing system in the public sector starts from the adoption of the Federal Law No. 44-FZ "On the contract system in state and municipal purchasing of goods, works and services" in 2013. This law for the first time included in the scope of regulation all the stages of purchasing activities from planning to execution of the contract. During development of the law, the provisions of regulations adopted by the UN Commission on International Trade were taken into account. One of the main problems of the previous period of public purchasing system was the lack of transparency in the public purchasing processes; thereby, the suppliers who have informal relationships with the customer, obtaining more information and receiving it earlier, were able to significantly increase their chances of winning the tenders. Within the framework of the law No. 44-FZ, a unified information system, i.e., a portal, was created. It contains public information related to public purchasing from purchasing plan of individual customers to analytical materials on the evaluation of the results of contracts concluded. The practice of the Law No. 44-FZ implementation confirmed the thesis on inefficient work of law provisions, for violation of which there are no sanctions; therefore, in 2016, the administrative responsibility for violations related to planning, rationing, justification of purchasing, and contract execution was established (the Federal Law No. 318-FZ "On amendments being made to the Code of the Russian Federation on Administrative Violations," dated July 3, 2016).

Protectionism, which was limited earlier, recently, due to the increasing complexity of the global political situation, has been expanded, which resulted in the introduction of legislative provisions restricting the supply of certain import goods; in particular, the following goods are under access restriction: medical products, pharmaceuticals, and food products. The ban on the purchase of import goods for ensuring state and municipal needs concerns such groups as light industrial goods (the RF Government Decree dated August 11, 2014, No. 791, "On a ban on the admission of light industry goods originating from foreign states and (or) services rental of such goods for the purposes of purchasing for federal needs, needs of subjects of the Russian Federation and municipal needs," engineering goods (the RF Government Decree dated July 14, 2014, No. 656, "On a ban on the admission of certain types of engineering products originating from foreign states for the purposes of purchasing for federal and municipal needs," software (the RF Government Decree dated November 16, 2015, No. 1236, "On a ban on the admission of software originating from foreign states for the purposes of purchasing for federal and municipal needs," and the goods, works, and services for the needs of national defense and security (the RF Government Decree dated December

24, 2013, No. 1224, "On a ban and restrictions on the admission of goods originating from foreign states, works (services) performed (rendered) by foreign persons for the purposes of purchasing of goods, works (services) for the needs of national defense and security."

In addition to statutory restraints, during purchasing of complex devices, there is often a situation of "economic" barriers. For example, the customer wants to buy a stair-climbing wheelchair for wheelchair users, a device for lifting upstairs a wheelchair with a man. The specifications prescribe characteristics of a device required, the characteristics reflect the quality of such devices made in Europe, and the initial contract price is calculated based on the price of a prime quality product. However, as the specifications must not include the brand and the country of origin, there is a high probability that at an auction, the supplier of cheaper products and products of lower quality made in Russia or China will win. This problem existed when the law No. 94-FZ was in force and is still relevant during implementation of the law No. 44-FZ; it is virtually impossible to draw up specifications so as to ensure the purchase of a prime quality product; according to formal characteristics in most cases, cheaper counterparts will match the criteria stated in tender documentation.

The Federal Law No. 44-FZ, as well as the previous law No. 94-FZ, provides for situations of single source purchasing; thus, in these situations, the use of procurement principles based on competition is not initially foreseen. As an example can serve placement of an order for construction of a bridge over the Kerch Strait, works that cost more than 228 billion rubles were purchased by force of the order of the Government of the Russian Federation.

If you consider the proportion of the use of different ways of the supplier determination, the sole supplier takes only the second place; the first place is taken by an electronic auction; in the first half of 2016 with the use of this method, 53.4% of the contracts were signed, which indicates the real expansion of the procurement principle application in purchasing activities of the public sector.

## Conclusions

In order to implement procurement principles in Russia, first of all, it is necessary to change the conceptual framework of the purchasing legislation formation. In many branches of the public sector, this reformation direction is already being put into action by the force of integration of results-based funding. The main problem of procurement is still corruption, rather than the degree of satisfaction of public goods recipients. The ideas of corruption prevention and competition development form the basis of the purchasing legislation, but the current law No. 44-FZ differs from previous regulations in this field in such an item as the analysis of the contract execution result, i.e., the system reform, is moving toward the implementation of international principles.

# History of Public Administration in Russia

Elena Leonidovna Popchenko
Department of Management Organization, Stolypin Volga Region Institute of Administration, Saratov, Russia

## Synonyms

Historical stages of development of governments; The centralization of power; The implementation of public policy during centuries

## Definition

The history of public administration is the main historical stage of development of civil service in Russia.

## Introduction

This article examines the historical aspects and stages of the civil service management system in Russia: formation and development of public service in the period of the Old Russian state, especially the prince's service vigilantes; the specificity of public service in the period of feudal fragmentation of Rus; the public service in the Novgorod and Pskov republics; and the Tatar influence on Mongol invaders in the process of civil service reform in Russia.

Every historical stage of development of Russia is characterized by a kind of social and political characteristic, and the success of the reforms largely determines that people are an important resource of any nation and that public servants perform practical tasks to achieve the objectives set by the company to the state.

## The Origins of Public Service of Russia

The Russian Public Service has deep, centuries-old historical and cultural origins. It is inseparably linked with the creation of a centralized Russian state, which has evolved in complex geopolitical conditions. The Russian historical literature is dominated by a variety of views on the origins of the formation of Russia as a state, but it is possible to identify common stages of development of the Russian state and the public service:

1. The emergence and establishment of the civil service in the ancient Rus (ninth century)
2. The princely state service (ninth century–the first quarter of the twelfth century)
3. Public service in the period of feudal fragmentation of Rus (the second quarter of the twelfth century–the fourteenth century)
4. Sovereign courtyard (Muscovy state) (fifteenth–seventeenth centuries)
5. The state service of the Russian Empire in the period of absolutism (eighteenth century–the middle of the nineteenth century)
6. The state service of the Russian Empire in the period of transition to a bourgeois monarchy (the middle of nineteenth century–beginning of the twentieth century)
7. Public service in transition to bourgeois monarchy (the middle of the nineteenth century–the beginning of the twentieth century)
8. Public service during the constitutional monarchy (1905–February 1917)
9. Public service in the period of the bourgeois-democratic republic (February–October 1917)
10. Public service in the USSR (twentieth century)
11. Public service in the period of perestroika – the formation of a new type of public service (1985–1999 years)
12. The modern period of development of the civil service in the Russian Federation

## Public Service in the Old Russian State

This article focuses on summary of public administration of the first three stages that characterize the emergence and development of public service in the Old Russian state.

The stage of "the emergence and establishment of the civil service in the ancient Rus (ninth century)" process is characterized by the formation of large commercial cities. "The main commercial cities of Russia were themselves to assume the defense of their trade and trade routes". From that moment, they began to arm encircling walls and administer a military unit reserved by military men. So industrial centers and warehouses of goods were turned into strongholds of armed seekers (key). This process is characterized by the destruction of the tribal union of the Slavs and dissolves it in the yard. In the Old Russian state, "Russian court" (householder's family with his wife, children, parents, and other relatives) served as a stepping stone from the ancient to the modern kind of a simple family and corresponded to the ancient Roman "names."

Tribal unions united – in the military and political purposes – to even larger formation (association), the so-called union of unions or super unions.

The emergence of large commercial cities was the impetus to education in Russia in the first half of the ninth century, a form of political development as a "policeman region." The area was known as the city (city of Smolensk, Smolensk Oblast; the city of Chernihiv, Chernihiv region; the city of Novgorod, Novgorod region, etc.). The policeman region is a shopping area managed by the city. Later in the process of formation of principalities policemen area previously independent, it became part of the Duchy of his administrative district, served as ready units of the regional division, established in Russia at the first prince of Kiev to the half of the eleventh century.

The process of consolidation of the Slavic tribes in Rus political union is considered to be the beginning of the registration of a single East Slavic state. In the historical literature, it mentions three important political centers in Russia: Cuiaba (Kuyavia), South Slavic group of tribes with the center in Kiev; Slavia, northern group, Novgorod land; and Artania, the southeastern group, Ryazan.

Old Russian state was a kind of federation of tribes; in its form, it was an early feudal monarchy. Russian statehood of that time was based on two forms of spatial territorial organization: the rural communities and cities and urban settlements.

Thus, we can state the fact that the need to protect towns and villages from external enemies was the basis of the birth of the civil service in ancient Russia. It is the prototype of a modern type of public service – military service.

## Stage "Princely State Service"

The stage of "princely state service" was in the ninth century–the first quarter of the twelfth century. "Many sources of information can be found on the history of Russia that the date of formation of Russia state is 882 years old, when the Russian Prince Oleg united North of Fame and Kiev into a single administrative and political entity – Kiev's Rus. In Kiev's Rus, it laid the foundation of governance and "public service," which were originally inseparable from a military organization and were based on the principles of vassalage. During this period, the support of the prince is a princely retinue, which had the name of the prince.

The brigade was unprofessional service vigilantes possessing the moral bond and friendship between the members of squads and the prince set up to enforce the powers of prince. The guards received the service and maintenance of the spoils of war from the prince. The number of guards is also largely dependent on the personal qualities of the prince: the prince was braver, and his squad was more numerous. The prince consulted with all members of the squad on military matters. Regarding the state of internal control, the prince consulted only with a select number of people who entered the council of the prince.

Duke squad had two levels: higher and lower. The higher (senior) squad, "boyars," had some privileges (nobles had their own small squads and others). The lower (younger) squad, "greedy," held at the princely court lower-level positions. Military and civil service was for the younger brigade tool transition into the senior squad. Duke squad is not a closed class – access to squad opened Russian and foreign soldiers who have good military skills.

Thus, we can conclude that the period under review was characterized by ancient Rus state management system – military democracy, which determined the content of the "civil service" of the time. In fact, the Old Russian state was a federation of land under the sovereignty of the prince of Kiev. With the proliferation of the grand princes of Kiev, the family practiced the selection of individual lands – principalities – in the reign of his sons. They were gradually replaced by the princes of the local dynasties. For some time, it strengthened the grand power. The stage of "public service in the period of feudal fragmentation of Rus (the second quarter of the twelfth century to the fourteenth)" is characterized by the reform of public administration – the Russian land is divided into multiple inheritance (patrimony). The second half of the twelfth

century in Russia existed with 15 independent principalities and lands that have received their names by city. Gradually, it formed the palace and patrimonial management system. This is due to the fact that the Russian princes are willing to strongly develop land belonging to them and fix them for their children and grandchildren. As a consequence, there is a change in the prince's retinue. Squad members gain osëdlost together with the princes, entering into a closer relationship with one or the other area. With settlement princely combatants disappears former friendship and moral way of life guards. Osëdlost isolates individual members of the squad, and they appear with new relations and areas of interest in addition to the military (trade, agriculture, crafts, etc.). The prince now has to deal not with a team but as a single whole and with individual members of the squad – the boyars.

The fragmentation of Russia leads to the formation of small specific states (principalities and provinces). Under the public service mainly refers to military service on general rules: the boyars in wartime had people living in their areas to join the prince's troops.

However, many of the boyars and the prince served in peacetime, holding various positions at the palace and regional management. Also the lord had the right to "refuse" from the service and go into the service of another prince. Until the sixteenth century, the nobles retained the right to inherit their land, even in the case of transfer to the service of the enemy of his former prince and handed them to the state possession of their new prince. They had in their fields all the fullness of administrative, judicial, and military authorities. Such rights have been assigned to them in the documents (charters).

One of the main jobs was as a butler. Butler ran Duke Estate, which at that time was not separated from the state economy. The chief butler was in charge of the palace of the prince in the city, was subordinated to the butler, and was in charge of the palace of the prince in small towns. There was also a post "courtier." Okolnichy accompanied the prince during the war and in peacetime (a trip to the state management, hunting, prayer, entertainment).

The prince bestowed the boyars of the civil service "feeds" or "paths." These were some of the types of property of the prince and of state property, which have been allocated to specific departments. The chiefs of these departments also held high positions. All locate such "ways" as a falcon (bird hunting), stables (horses, meadows), the cup (beekeeping, drinks, forests), and stolnichy (fishing, vegetable gardens). Villages that have been assigned to the "ways" were completely isolated from the overall regional management: management is concentrated in one department, all cases concerning the population (administrative, judicial, economic, social). All the nobles who led the agency were directly subordinated to the prince.

Thus, the public service in the period of feudal fragmentation of Rus – it's unprofessional service undertaken servants. The relationship with the prince was based on property or enslaving addiction. The prince's office was divided into:

1. The voluntary military and civilian service boyars landowners
2. The court service prince's servants

The transition to feudal fragmentation was not accompanied by the decline of Russia. It is characterized by positive changes in the socioeconomic, political, and cultural development, contributed to the lifting of certain Russian land, the growth of cities. However, the adverse effects of the onset of fragmentation include strengthening the princely strife and weaken the military power of the country.

## The "Public Service" in the Novgorod and Pskov Feudal Republics

In the twelfth century in Novgorod region, republican bodies were formed that were standing on the prince's power. Novgorod took to his princes, based on their own choice and under certain conditions. The prince and his retinue were hired by armed forces of the republic. The prince was responsible for the protection of the Novgorod region from external enemies, was the rule of

law, and was the highest court. However, the prince of administrative and judicial actions committed not alone but in the presence and with the consent of the elected person of Novgorod – "mayor."

Lower-stage management in Novgorod was the unification of neighbors who have chosen the elder. Five urban districts of Novgorod were self-governing territorial-administrative and political units. The supreme authority, representing the interests of all people, was the town meeting (chamber) of free citizens, owners of urban households, and farmsteads.

Veche invited the prince and his retinue, elected the chief officials of Novgorod, and chose the head of the Novgorod Church – archbishop.

Pskov feudal republic was characterized by the same as in Novgorod, a model of republican life, which began to emerge in the second half of the thirteenth century.

Thus, the republican service acts as a special type of service in the period of feudal fragmentation of Rus and has the following features:

- Public service is determined by the feudal democracy of the republic.
- Public service is unprofessional service; it is based on belonging to a noble family.
- Public service is carried out in favor of the aristocracy.
- Public service is carried out with the help of national authorities.
- The civil service is divided into military service, civil service, and the service of the archbishop.

Centralization of power in the Russian state and the subsequent annexation of Novgorod and Pskov have led to the liquidation of the republican system.

## Public Service in the Period of Feudal Fragmentation of Rus

One great factor that influenced the development of public service was that in the 1930s–1940s of the thirteenth century, Russia was conquered by the Tatar-Mongols and fell into vassalage to the Golden Horde. De jure, Russia was not an independent government. In this period, it was built with the new principle of the transfer of state power. The Russian transfer custom prince power of seniority was replaced by the Mongolian issue "label" – the mandate of the public administration and the right to collect tribute for the Golden Horde from other Russian principalities. Issuance label evolved into an important political instrument of the khans of the Golden Horde, which pushed the interests of Russian princes. Fueling the princely strife, the Golden Horde has strengthened its dominance over Russia.

De facto, the internal political life of Russia did not stop but adjusted to the khan of the Golden Horde. Thus, under the influence of Mongol control, the organization of the Russian army and military service significantly changed:

- The army was divided into five major divisions (regiments): the large regiment, the right-hand regiment, the left-hand regiment, the advanced guard regiment, and a regiment.
- It was established as a compulsory military service, including the rural population, which has not participated in military campaigns in the Kiev period.
- Change of the structure and purpose squad: senior squad turned in free prince's servants and became known as the nobles, and the younger combatants were his servants, who were attached to the service for a while or forever.

With the collapse of the Golden Horde, own political force Russia out from under Mongol control and began to gain new strength. The Mongols contributed to the elimination of democratic institutions in Russia and the absolute power of the feudal princes. This, in turn, has led to non-admission to the power of the boyars, gradually turning them into servants of the princes of Moscow. Subsequently, with the strengthening of the power of the prince of Moscow, the transfer of state power began to be carried through the generations – from father to son.

Thus, the Tatar-Mongol rule contributed to the formation of a qualitatively new "public service" Asian type:

- State – the patrimony of the prince; officials – servants of the prince.
- The presence of the prince's court.
- The military and the civil service – the duty of the boyars and nobles.
- The army is recruited from among the people.

To summarize the origin and development of public service in Russia:

## Conclusions

With the establishment and development as an independent state, Russia formed the mechanisms and institutions of public administration. To ensure the activities of the state and the decision of its external and internal issues, public servants have become necessary. The first employees in Russia were vigilante princes. The specific nature of public service in this period has Novgorod and Pskov republic (power assembly – veche). The period of feudal fragmentation of Rus, which began in the twelfth century, and the Mongol conquest of Russia contributed to the reform of the control mechanism in the Russian principalities and led the formation of the state apparatus, having the features of the eastern rigid centralized management. The capture of Russia by Tatar-Mongols had serious consequences for the development of Russian statehood. It was one of the reasons for the backlog of Russia from European countries, contributed to the further strengthening of political fragmentation, and, most importantly, has played a crucial role in determining the nature of the future of the Russian statehood, strengthening the "Asiatic" despotic principle in its development.

# History of Public Administration, Brazil

Frederico Lustosa da Costa
Administration – Graduate Program, Fluminense Federal University, Niterói, Brazil

## Synonyms

Brazilian public administration; History of State, Brazil; Insitutional History, Brazil

## Introduction

The study of the history of Brazil's Public Administration is part of a historiographical tradition that goes back to the emergence of the Nation. In fact, institutional history constitutes a very important aspect of the construction of the national identity itself, which passes through the (selective) memory of the acts, facts, and interpretations of Brazilian political-administrative life. For this very reason, although with less intensity in recent years, much has already been written about the teleology, morphology, and functioning of the Brazilian State and its functional apparatus.

The purpose of this entry is to present and critically discuss the evolution of historical studies on Brazilian public administration. It is not a question of presenting a panorama of the institutional history of almost two centuries of independence, as already attempted in other publications (Bresser Pereira 2001; Lustosa da Costa 2008). It is rather a matter of identifying the established narratives and interpretations and pointing out possible gaps, omissions, and misconceptions crystallized over the years that continue to inform the understanding of Brazilian public administration.

Therefore, in addition to the record of the main bibliographic antecedents, it is necessary to point out inescapable theoretical and methodological issues (of a historiographical nature), the reference framework for the inauguration of this administrative history, the problems of periodization, and the prospects for the renewal of Brazilian institutional history. At this stage, rather than initiating a literature review, with direct consultation with primary sources, it is necessary to delimit the field in light of the milestones of contemporary historiography.

Thus, the sections that follow try to fix the frame of the object, giving account of its nature, identifying the historiographical issues that concern it, resuming the bibliographic antecedents, and seeking ways to work the chronology from the new conceptions of time and duration. This entry represents a modest contribution in this sense. It briefly and objectively presents the theoretical and methodological bases and the state of the art of historical studies in the area of Public Administration in Brazil.

## Framework – History of State and Public Administration

*Public Administration* is a polysemic expression because it designates a part of the State that is, at the same time, an institution, a staff, and a management process. In this context, the institution is the administrative apparatus that gives consequence to government decisions, that is, that implements public policies. It is the set of organisms that administers the *res publica;* the body of officials that gives life to these entities. It is the directory of government activities aimed at achieving the public interest or common good of a community.

The history of Public Administration is also a History of the State and must contemplate, in the long term, the institutional apparatus – political, normative, and operational – and its collective representations and understand it in its relations with society. It should understand, without segmenting, the different figures of the modern state – the democratic Leviathan, the instigator of the social, providence, the regulator of the economy (Rosanvallon 1990, pp. 15–16), and the bureaucratic ogre (Paz 1979).

The first four figures of the Modern State correspond to different dimensions of its relations with society – the democratic institutions that shape the contract state; the rules, symbols, and practices that produce social cohesion and constitute the Nation; the social security instruments and welfare actions; and the different forms of intervention in the economic domain.

The fifth figure paraphrases the expression "philanthropic ogre," coined by Otávio Paz (1) to refer to the distortions of the welfare state. *Bureaucratic ogre* would be that figure of the State that contemplates its adjective aspects, that is to say, the whole set of norms, bodies, and positions at the service of the needs of the State itself.

The processes of transformation of these figures obey a double movement – from society to the State and from the State to society. Thus, its history can seek, on the one hand, to understand the changes in the state apparatus as responses to movements in society itself, as a product of the power relations between the interests of parts of society and, on the other hand, to map the institutional processes of policy formation that make up the decision-making process in the context of government bureaucracies.

In this sense, a History of Public Administration must emphasize the process of functional differentiation of the State, whose historical stages are marked by different institutional formats that translate into various "policies" or policy instruments. Although these two processes may be the result of transformations that are born "outside" the State, they seek to show how institutional changes determine the emergence of new policies or how the need to create new policies (required by society or even by the "institutional" market – the set of demands born within the State itself) brings about important institutional transformations within its apparatus.

It thus offers scholars the possibility of reflecting on the nature of these transformations and, at the same time, examining what is recurrent in the morphology and functioning of the Brazilian governmental organization, discussing the changes in the nature of

intervention in social life, the (permanent) growth of its apparatus, the cycles of centralization and decentralization, the processes of democratization and bureaucratization (which, it is believed, still left a residual space for the patrimonialist heritage), and the expansion of supply and, eventually, of access to the services it provides.

## Historiography Issues

The twentieth century produced great transformations in modern historiography, opening new theoretical and methodological perspectives and incorporating new objects. Until then, the only transformations in the historical sciences had occurred in the preceding century, with the advance of positivism over scientific thought, the emergence of Marxist doctrine, and the emergence of national historical schools (Cardoso 1982, p. 30).

In fact, although a certain "methodological rigor" can be identified in historians of Greek-Roman antiquity, such as Tulcíades and Políbio, the historiography of antiquity and the Middle Ages was almost always apologetic, destined to glorify the great men who could serve as an example to new generations.

Although positivism did not reserve the status of science for history, it imposed a rigorous examination of the sources and fidelity to the *facts*, which were a matter for sociology. Positive science refuted the causal explanation in history because its object is unique, unrepeatable, and therefore not verifiable. In other words, they are facts excluded from scientific interest. Although more precise and documented, the story consisted of a chronicle of events; it was still an *événementielle* narrative.

Marxist thinking had a dynamic conception of social reality, asserting that change from one state to another could be understood through cognizant laws. Dialectical materialism was the key to understanding this dynamism, because it allowed us to identify the contradictions present in a stage, its forces of transformation. This approach put the economic determinations (*infrastructure*) in the foreground, minimized the freedom and importance of action of the individual subject, and gave rise to the adoption of a long-term perspective. However, Marxism only came to be configured as a historiographical current in the twentieth century to the extent that, before that, it had little influence on "professional" historians.

At the end of the twenties, the great renewal came with the emergence of the School of the *Annales*, a heterogeneous group of historians (and geographers) that gathered around the journal *Annales d'histoire économique et sociale*, founded in 1929 by Marc Bloch and Lucien Febvre. According to Cardoso, the main characteristics of this historiographical trend were

- The conception of history as a science
- The identification of problems and the establishment of hypotheses (overcoming the "story-narration")
- Approximation and exchange with other social sciences
- The broadening of the scope of the object – "global structural synthesis of all aspects of social life: 'material civilization', power and mentalities"
- The emphasis on "social, collective, and repetitive" aspects, rather than biographical, individual, and episodic ones
- The use of various sources, not just written documents
- The construction of multiple temporalities
- The awareness of the relations between the present and the past and of the relations of implication of the historian (*op. cit.*, pp. 37–38)

Some of these elements are close to the Marxist approach, especially with regard to the pretensions to a global synthesis of social reality as a structured totality, to the recognition of the specificities of each era, to the interest in economic aspects and statistical data (serial history), and to the awareness of the social (and historical) constraints of knowledge (historical). However, most of the members of the group were not Marxists and the influence of the *Annales was* felt throughout French historiography and later throughout the world.

After the Second World War, France remained at the forefront of historical studies. In the fifties and sixties, following on from the previous movement, research continued to emphasize the great historical syntheses, making use of the macroeconomic approach, the study of social structures, the articulation of secular tendencies with short conjunctures. The main methodological resource was descriptive statistics, erected as a reference model for data construction. The problems posed for study revolved around a central question – how the social transformations took place, in which rhythms and which groups benefited from them (Lepetit 1995, p. 10).

In the 1970s and 1980s, another cycle of renewal took place with the emergence of *New History*, a designation borrowed from the title of the dictionary published in 1978 by Jacques Le Goff (1990) that constitutes a collection of the immense variety of studies that adopted new objects and new methods of work. History was now closer to anthropology than to geography, demography, economics, and sociology, both in terms of themes and methods of data collection. Themes such as the body, love, table manners, odors, rituals, and fashion became part of the repertoire of historical studies, which also began to make use of new sources – archaeological remains, verbal accounts (oral memory), images, subjective data. These aspects of reality were related to the ways of thinking, appropriating the world, and acting, configuring other schemes of collective representation and temporality and were thus often inscribed on the level of mentalities and long duration, themselves notions subject to all kinds of ambiguity. Having been criticized for its excessive comprehensiveness and lack of precision, the history of mentalities was gradually replaced by the History of Representations or Cultural History, which accounts for the singularities of social class, gender and age groups (Chartier 1988). In any case, the interest in very specific aspects of reality and the diversity of themes under examination led critics of *New History* to refer to a *history in crumbs* (Lepetit, *op. cit.*, p. 11).

In the 1990s, the linguistic shift (*liguistic turn*) in the social sciences and the criticism of New History and, above all, of the History of Mentalities led to the establishment of a new program, the main points of which can be summarized as follows:

- The resumption, in a new perspective, of some themes and methods from previous decades
- The recognition of the plurality of problems, methods, languages, and approaches in the social sciences, which enrich each other and favor interdisciplinarity
- The awareness that history is neither a duplication of reality nor a mere narrative discourse; it is, at the same time, discourse and technique of research, narration and operation of critical procedures, point of view and mapping of representations
- The emphasis on the study of practices and representations (uses of identity) referenced in the various forms of identification and social insertion – gender, age, social class, region, etc.
- The recognition and articulation of multiple temporalities, in function of the historical time under examination and the dynamics of the social aspect analyzed

What are the consequences of these transformations in the world of historiography for the project of a history of the State, the government, and the Public Administration in Brazil?

To try to answer this question, it is necessary, in the first place, to reiterate that historiographical production in this field has been practically immune to these changes in the theoretical-methodological perspective. Administrative history is an *evenementielle* history, a repertoire of acts and facts, where the voluntarism of monarchs, politicians, and administrators stands out. It continues to use the same sources of written documentation, but descriptive statistics are of little value. Thus, considered from the point of view of contemporary historiography, the history of the State and Public Administration must redefine its object in the sense of taking it in its entirety and complexity and apprehend it, at the same time, as legitimation, sovereignty, empire, structure, heritage, bureaucracy, and agency.

It is a story of the power instituted, of its sources and manifestations, which, according to the Rosanvallon (op. cit. pp. 11–14), obeys four methodological imperatives that give it precision and uniqueness, namely:

- ***Deglobalization*** – consists in avoiding taking the State as a coherent whole, a unified structure, a block, as happens when certain statistics are used that do not allow us to understand the realities of subsets
- ***Hierarchy*** – consists of integrating and hierarchizing the different levels of apprehension of the phenomenon, separating different dimensions, historical diachronic realities, and national specificities
- ***Articulation*** – between two levels of reality (administrative apparatus and abstract political form) and two historiographical perspectives – the history of administration, the objective face of the State, and the history of ideas and representations
- ***Totalization*** – which avoids "slicing" the State into sectors – social policies, economic regulation, police, currency, public service, reinforcing a purely instrumental conception. The history of the state is not a sum of the histories of the executive branch ministries or the policies embodied by them

The adoption of these imperatives prevents the reification of the State, the sectorial or chronological cut and expands the levels of analysis.

Secondly, we should remember the problem of multiple temporality and how it applies to the history of the State. It is known that worldviews and collective representations of society change more slowly than social processes, which, in turn, undergo slower transformations than economic structures. It was precisely because of this difference in rhythms that the so-called History of Long Duration aroused interest in the study of people's mentalities (Vovelle 1987), more recently nuanced in the history of social representations (Chartier 1988). In the same historical context, certain representations informed by tradition may coexist with new institutions and emerging social practices. Thus, there is no sequential logic in the emergence of institutions, practices and representations.

As a Brazilian example, one could take the description of patrimonialism (as a historical reality or representation of the relations between State and Society) as a chapter in the history of the Mediterranean, Iberian, or Latin American mentality. According to the perspective of the analysis inaugurated by Faoro (2001), the Brazilian modernization, conducted within the framework of the patrimonial domain, never managed to undermine the bases of oligarchic and estamental interests that benefit from it. The strength of tradition (Meyer 1987) that legitimizes the privatization of the State prevailed and remains the main arena of group politics. The strength of tradition – this is because it has always been – is felt as a persistent representation that still informs analyses and diagnoses of reformers. The permanence of patrimonialism (as social representation) offers a distorted view of the historical process and of the democratic institutions imported from other countries after the proclamation of the Republic.

Third, contemporary historiography makes it possible to define as an object a conception of the State itself as social representation, as a collective construction of a set of symbolic images that introject values and establish mental predispositions and reflective attitudes in the individual and collective treatment with the various categories that account for the relations between the State and Society – citizenship, authority, sovereignty, democracy, etc. Thus, the history of the State is the history of its institutions and the appropriation that citizens make of them, between practices and representations.

Finally, the new historiographical perspectives favor the incorporation of other sources and the processing of previously neglected statistical data. At the same time, they open up to new sources and more frequent use of statistical series that account for changes in important variables.

## Background

Since the birth of Brazil Nation, besides the political facts, the institutional and administrative

aspects of the national reality have been objects of interest to historians. Francisco Adolfo de Varnhagen (1956), the first great historian of the country, dedicated several chapters of his *General History of Brazil* to talk about the organization and administration of the Colony. Oliveira Lima (1996), Dom João VI's biographer, also dedicates important parts of his book to the political-administrative organization of the United Kingdom of Portugal, Brazil, and Algarves.

Already in the twentieth century, Max Fleiuss (1922) published the first synthesis of Brazil's administrative history, inaugurating a tradition that was consolidated in the following years and was culminating in the publication of the monumental *Administrative History of Brazil*, in almost 40 volumes by various authors, begun in 1956, in the former DASP and later republished and continued by the extinct FUNCEP, now the National School of Public Administration (ENAP), in partnership with the editor of the University of Brasília (Unb), since the late 1970s. In parallel to these more in-depth works, numerous textbooks on the economic and administrative history of Brazil were published during the 1950s, 1960s, and 1970s for use in high schools (Andrade 1950; Avellar 1970; Garcia 1956; Lacombe 1984; Lobo 1978; Macedo 1964; Tapajós 1984; Taunay 1984).

Thus, the last great chapters of the history of Brazilian public administration were published in the early 1980s, when the great recent advances in historical science had not yet been sufficiently disseminated in Brazil. Most of the works published until then were limited to the registration of political and administrative facts, constituting a typical example of the so-called history of events.

It is, as the name implies, an administrative history, occupied, above all, with presenting the structures and facts of the administration, without intending to understand, among many other aspects, the logic of State intervention in social life, the mechanisms of extraction and allocation of resources of society, and the movements of concentration and deconcentration in the distribution of power among levels of government.

It is true that this incursion into the history of institutions cannot be dissociated from the very history of Brazilian formation, solidly established for a long time and largely enriched in recent years. The great interpretative summaries on colonelism (Leal 1997; de Queiroz 1976), patrimonialism (Faoro 2001) and formalism (Guerreiro Ramos 1983), the works of some Brazilianists (Bethel 1985; Bethel and Carvalho 1985; Graham 1997; Morse 1988), and the thematic monographs of social scientists (Uricoehchea 1978; de Queiroz 1976; Weffort 1978; Schwartzman 1988) and historians (Carvalho 1996; Castro Gomes 1988; Dolhnikoff 2005; Lessa 1999; Linhares 1990; Martins 2007; Rohloff de Mattos 1999; Wehling and Wehling 2004) (An excellent panorama of historiography in the field of public administration was made by Lúcia Guimarães (2010) in her "Brief Notes on the History of Public Administration in Brazil".), in presenting their selection of important acts, facts, and processes, offer some findings and teachings that cannot be neglected by the history of public administration.

However, understood as a phenomenon of superstructure or expression of the autonomization of the political sphere, institutional change follows, at its own pace, the cycles of politics, economy, society, and culture, in the short and, above all, in the long term. For this reason, the national state can be a separate object, whose history is not to be confused with the chronology of political events.

In Brazil, the inexistence of more systematic and specific studies leads to the updating of ideas made and the establishment of hurried judgments, crude simplifications, and unreasonable generalizations. Although many contemporary analysts resort to Brazilian theories and the great theses of Brazilian social thought to explain the "dysfunctions" of the state and resistance to change, most studies on public administration resort to the categories established in these socio-historical syntheses as abstract entities, without seeking empirical evidence and relevant correlations. They present themselves more as obstacles (contingents) to administrative reform than as objects of analysis and intervention.

There are, for example, no historical series or statistical inferences on the relationship between these problems and the number of employees (and their social origin), the share of public revenues in GDP, the distribution of charges and resources among levels of government, tax evasion, and the targeting of public spending, which point to any evidence worthy of note. There is a very large gap between the recognition of well-established theories and the knowledge of past reality.

On the other hand, there is a tendency to simplify the analysis of the processes of transformation of public power from the institution of hereditary captaincies to the Revolution of 1930. It is claimed that we live four centuries under the tutelage of the patrimonialist, authoritarian and centralizing Leviathan, immense and unapproachable organism. Everything is happening as if the stagnation had taken over a vegetative apparatus that only grew in size, multiplying by scissiparity; as if the colonizing company did not suffer the influx of the transformations of the economy and European politics; as if the creation of the General Government – fragile that it were, the nationalization of the administration of the captaincies themselves, the regulation of the exploitation of gold, the institution of the states of Brazil and Maranhão and Grand Pará, the repression of regional revolts and insurrections, the advent of the United Kingdom, Independence, the strengthening of provincial governments, the functioning of the Council of State, the proclamation of the Republic; the emergence of the power of the "republican" oligarchies had no significant impact on the state apparatus; as if transformations only began to occur with the advent of the New State.

In recent decades, along with more permanent initiatives, such as the continued work of the MAPA Project (Memory of Public Administration) of the National Archives, in the wake of the celebration of anniversaries, such as the 200th anniversary of the transfer of the Portuguese Court to Rio de Janeiro, there have been occasional (but significant) efforts that attest to the renewed interest in historical studies in the field of public administration (Cabral 2011). Thus, several recent publications have joined the vigorous historiographical production that flourished in the area until the 1980s.

By way of example, it is enough to mention the holding, in 2008, of the seminar *Brazil: 200 years of the State, 200 years of public administration*, a joint initiative of the Getúlio Vargas Foundation (FGV), the Casa de Rui Barbosa Foundation and the Court of Auditors of the City of Rio de Janeiro (TCMRJ), which offered a vast historical overview of the evolution of Brazilian public administration and its historiography and resulted in the publication of the book of the same title (Lustosa da Costa and Zamot 2010). In the year of publication of this first compilation, another one with more modest objectives, edited by Christina W. Andrews and Edison Bariani, entitled *Public Administration in Brazil: brief political history*, with various texts of historical interest (Andrews and Bariani 2010), was also organized. Two years later, at the General Archives of the City of Rio de Janeiro, on the initiative of the National Archives and the Public Archives of the State of Rio de Janeiro, the *State and Administration: Research Perspectives* seminar was held. The objective of the seminar was to discuss the history of the State and of Brazilian public administration and to present historiographical advances in this area. This event resulted in the publication by the National Archives of a thematic dossier on State, Power and Administration in the magazine *Acervo* (2012), with texts on various themes and different historical times.

Despite the advances made in recent years in the resumption of historical studies in the area of Public Administration, much remains to be done in order to incorporate the main achievements of contemporary historiography into this historiographical production. In fact, most of the recent works that have contributed to the renewal of the field have contributed little to overcoming the limitations indicated by the critics that addressed the monumental *Administrative History of Brazil*, initiated by DASP still in the 1950s (Lustosa da Costa 2010; Lustosa da Costa and Lustosa da Costa 2016).

## Frame of Reference

To take the disembarkation of the Portuguese Crown in Rio de Janeiro in 1808 as a milestone for the beginning of the construction of the National State does not mean that nothing existed in terms of institutional and administrative apparatus. In the colony, there was a broad, complex, and branched administration.

Caio Prado Júnior (1979, pp. 299–300) warns that, to understand it, it is necessary to get rid of contemporary notions of the State, public, and private spheres, levels of government, and different powers. The state represented by the colonial administration is, at the same time, an undifferentiated whole that encompasses the individual in all aspects and a myriad of instances and jurisdictions that go from the king to his most modest servant, whose attributions overlap, confuse, and contradict each other. It is a Cipoal of general rules, charges, powers, constituencies, special provisions, and extraordinary missions which did not comply with uniform principles of division of labor, symmetry and hierarchy. Legislative chaos gave rise to functions in one place that did not exist in others; competences were given to a server when they already belonged to third parties, direct subordinations that subverted the hierarchy and undermined authority.

The historical synthesis of Caio Prado Júnior (1979), taken up by Arno and Maria José Wehling (Wehling and Wehling 1999), points to centralization, the absence of differentiation (of functions), mimicry, the profusion and detail of norms (legalizing fury), formalism, and slowness as main characteristics of colonial administration. These dysfunctions result, to a great extent, from the transplantation into the Colony of the existing institutions in the metropolis and the vacuum of authority (and obedience) in the immense territory, constituting an authoritarian, complex, fragile, and ineffective organism.

This is not to say that there has not been a process of gradual rationalization of colonial rule over three centuries. From the pombaline administration, the paternalistic empiricism of traditional absolutism was gradually replaced by the rationalism typical of enlightened despotism. This change was mainly expressed in the working methods and processes that gave rise to the emergence of a bureaucracy.

The centralization of decisions in the Portuguese Crown apparently emptied the power of the governors and judges. Everything was prescribed in detailed regulations and nothing was excluded from the competence of a higher authority which could decide at first instance or on appeal. But the enormous distance from the seat of power and the slowness in the exchange of messages created a void of legal authority that opened space for the discretion of its representatives in the Cologne. It was attempted to limit the action of the Crown's preposts with the detail of regulations that ended up becoming repetitive, overlapping, contradictory, and confusing. As they statued institutions symmetrical to those of the administration of the metropolis, they sinned by the mimetic artificialism that made the norms superfluous and ineffective. The formalism of the rules, the short arm of authority, and the widespread corruption gave rise to the authoritarianism of those who had to impose themselves on the subjects abandoned, with the very means that they were able to extract from them.

## The Construction of the National State

The transfer of the Portuguese royal family to Brazil, despite an alleged sense of strategy conferred by some historians, was confusing. Until the very last moment, the Prince Regent hesitated to leave in the face of the remote possibility of the French accepting another bribe. It was only decided when Junot's troops were already on Portuguese soil, on the verge of Lisbon. The uproar described by some of the accounts of the moments that preceded the long crossing is not consistent with the detailed planning that the unprecedented move from one court to another continent should deserve (Wilcken 2005, pp. 35–38). First of all, the very choice of the ten to fifteen thousand people, who would

make up the capacity of the ships, says something about the institutions and spaces of power that were being transplanted. In the second place, the selection of goods that could be carried included, in addition to the treasures and objects of unquestionable material value, books, papers, artifacts, instruments, and symbols necessary for administration. Thirdly, the establishment of a simulacrum of government on European soil, which took the form of a regency, which was then overthrown by the occupier.

> The entire administrative collection was on board, archives, documents and government papers, and so arranged that, upon disembarking in Rio de Janeiro, no special fault or difficulty was felt, and the work of directing the monarchy continued on the New Continent as normally as if the regent had been in Lisbon. What better proof do you require of the foresight, the lengthy preparation, and the observance of the most detailed orders to organize the transfer plan? (Calógeras 1980, p. 59).

The conditions of arrival are also indicative of the possibility of setting up the administrative, military, protocolary, and symbolic apparatus of a European court. The first problem was evidently the existence of buildings to accommodate the residences of the exiled nobility and the new offices of the Kingdom. This was done by dislodging the rulers of the Crown, the few noblemen, and the rich merchants who willingly, willingly, some others, gave up their houses and palaces. On the other hand, the patrimonial tendency to gather in the same building, the domicile, and the place of work was accentuated.

The Regent arrived in Rio de Janeiro with a government formed by the ministries of the Kingdom or of the Businesses of the Kingdom, whose holder also acted as assistant minister to the Cabinet Dispatch and as President of the Royal Treasury; of the War and Foreigners (or of the War and Foreign Affairs); and of the Navy (or of the Navy Businesses) and Overseas Domains; that is, three ministers for six portfolios. Three days after his arrival, he replaced the ministers, replacing them with a team more identified with the Anglophilic faction.

The establishment of the Court led to the creation of a series of organisms that existed in the old headquarters of the Kingdom, some of which were not as necessary as others that were urgently needed in the new metropolis. The government arranged in accordance with the Almanaque of Lisbon gave the opportunity to create positions and honors for so many who had made the sacrifice of accompanying His Royal Highness. This is how the Desembargo do Paço, the Finance Council and the Trade Board were created, when the country needed, according to Hipólito da Costa, "a mining council, an inspection to open roads, a map writing, an examination of river navigation" (Vinhosa 1984, p. 167). But it also took care of the Government to create useful and necessary institutions and organisms, such as the Navy Academy, the Artillery and Fortifications Academy, the Military Archive, the Royal Typography, the Gunpowder Factory, the Botanical Garden, the National Library, the Academy of Fine Arts, the Bank of Brazil, and the iron establishments of Ipanema. There are many creations and institutional, legal, and administrative innovations that have had a broad impact on Brazil's economic, social, political, and cultural life, both at the national and regional levels. They are laws, cities, industries, roads, buildings, taxes, jails, parties, and customs that were introduced in the quiet daily life of the old colony.

The fact is that the transfer of the Court and later the elevation of Brazil as an integral part of the United Kingdom of Portugal constituted the basis of the national state, with all the apparatus necessary for the affirmation of sovereignty and the functioning of self-government. The elevation to the condition of court of a transcontinental empire made the new Brazilian administration, now properly equipped, the expression of the power of a national state that could never again become a mere subsidiary of an overseas metropolis. This is in fact what happened.

## Periodization Problems

One of the main challenges in the construction of a history of the State and of public administration is to define the milestones to be taken as

a reference for the establishment of its major constitutive stages.

Almost all historical narratives adopt practically the same periodization, with small variations resulting from the perception of the degrees of depth of the changes made. They take up indications suggested in classics such as Calógeras (1980) and Prado Júnior (1979), contemplating brief references to the long period before the 1930 revolution, and, more recently, in Guerreiro Ramos (1966), Wahrlich (1974), and Marcelino (1988), suggesting three, four, or five subsequent phases.

It has already been said that, since 1930, Brazil has lived in the Vargas era (Camargo) – one was Vargas with Vargas (1930–1954), one was Vargas without Vargas (1955–1989) and, since 1990, one was Vargas against Vargas. That is to say, the major reforms carried out in the 24 years that Vargas was at the center of national politics have shaped the Brazilian economy, society and the state, guiding the subsequent reforms. Since then, political forces on the right and left of the ideological spectrum have tried to capture or deny their heritage.

The Vargas with Vargas era, which goes from the liberal revolution of 1930 to the death of the president in 1954, corresponds to the period of accelerated modernization that initiated the process of economic growth, based on industrialization via import substitution. It is an era characterized by the strong presence of the State in the economy, making direct investments, offering subsidies and incentives, regulating labor relations, and coordinating economic decisions.

The same development strategy, despite the sudden political and ideological changes that took place in the country after 1954, prevailed in the Vargas without Vargas era. Although this model had been in crisis since 1974 as a result of the second oil shock, Brazil persisted in the policy of industrialization via import substitution and state dirigisme until the end of the military dictatorship and even the transition government (1985–1990). Therefore, this period can be considered a Vargas era without Vargas because it kept all the structures created in the first phase intact.

Since 1990, with the Collor administration, there has been a deliberate movement to break with the retail heritage through trade liberalization, privatization, abolition of monopolies, socio-economic deregulation, welfare reform, and administrative reform. However, all these measures have not yet laid the foundations for a new model of economic growth, have not profoundly altered the social structure, nor have they redefined the framework of the political pacts that have been signed since then. It is, as has been said, an era of Vargas versus Vargas.

This periodization centered on the figure of the president who represents the turning point in the process of modernization in Brazil does not allow us to understand the movements of institutional and administrative reform that took place in shorter cycles, making it necessary to identify other phases, intermediate or not, in order to refer to the narratives. Another periodization, still centered on the great transformations of the twentieth century, is the one proposed by Martins (1995, p. 82), which identifies five periods in the "modernizing trajectory" of Brazilian Public Administration, namely:

- From 1808 to 1930 – the "Traditional" Administration
- From 1930 to 1945 – the Modernisation "Daspeana"
- From 1945 to 1964 – the advent of the "Parallel Administration"
- From 1964 to 1985 – the "Administration for Development"
- From 1985 to 1994 – the "Age of Demodernisation"

In addition to being intrinsically linked to the idea of modernization, this sequence has the disadvantage of classifying the periods of the mandates of Presidents Figueiredo, Sarney, Collor, Itamar, and Fernando Henrique Cardoso under different criteria. The period identified as the "era of demodernization" (1985–1994) could designate both the paralysis of the

import substitution process (Figueiredo Government: 1979–1985) and the inflationary and recessive crises of the New Republic (Sarney Government:1985–1990), both the abrupt changes in Brasil Novo (Collor Government: 1990–1992) and the busy transition experienced after the *impeachment* process (Itamar Franco Government: 1992–1994), as well as the Reform of the State Apparatus begun in 1995 (Fernando Henrique Cardoso Government: 1994–2002).

Although both periodizations are useful to reference the perceptions of continuities and discontinuities in the process of "evolution" of the Brazilian State in the republican period, for the development of this work, it is convenient to adopt a temporal perspective that privileges, at the same time, the political and institutional changes that transform the figures of the national State, it is worth saying the representations of the changes conveyed by the historical narratives themselves, as follows:

- From 1808 to 1840 – the construction of the national state
- From 1840 to 1889 – the monarchic "representative" state
- From 1889 to 1930 – the State in the first Republic
- From 1930 to 1945 – the "bureaucratization" of the national state
- From 1945 to 1964 – the national-developmentalist state
- From 1964 to 1989 – the State and authoritarian modernization
- From 1990 to 2002 – the State in the era of managerialism

Before the first period, there was the great vestibular stage of the Colonial Administration (1500–1808). From 1808 to 1840, Brazil is in the stage of affirming sovereignty, suffocating revolts and rebellions, and forming national institutions, from the constitution of self-government, a stage that has as its initial mark the arrival of the Portuguese relational family in Rio de Janeiro. The second moment (1840–1889) corresponds to a prolonged period of political stability, within competitive oligarchy politics. The third period (1889–1930) corresponds to the so-called Old Republic and coincides with the establishment of republican institutions and the formation of the Federation. The fourth period (1930–1945) is equivalent to the first Vargas government, marked by profound transformations in the economy, in society and, above all, in the Brazilian State. The fifth period (1945–1964) is a kind of second phase continuation of the previous stage, with the accentuation of some characteristics and the attenuation of others. This is an acceleration of the modernization process with emphasis on supplementary and promotional action by the State. The sixth period (1964–1989) was marked by the rise and fall of the military regime, which maintained the modernizing project and intensified the presence of the State in the economy, the centralization, and the technocratic bias of decisions. The seventh period (1990–2002), characterized by economic stabilization, structural adjustment, and economic opening, introduces neo-liberal and managerialist reforms.

Of course, no periodization is free of controversy. Even among the "new" reformers, who identify with the project of the first FHC government (1995–1998), there will be those who believe that some of these transformations began in the Sarney government (1985–1990) and others who argue that the Master Plan for the Reform of the State Apparatus constituted a break with previous governments. In any case, everyone would agree that the logic behind PDRAE represents a paradigm shift in relation to many of the principles enshrined in the 1988 Constitution.

## Closing Remarks

This entry is an approximation to the theme of the history of the State, of the governmental organization, and of the Brazilian public administration, within a contemporary historiographical perspective. It sought to present a brief overview of historical studies and to offer a contribution to a project to develop a new history of public administration that meets the following aspects and needs:

- The incorporation of the theoretical and methodological contributions of New History
- The construction of a periodization that takes into account the great transformations that took place before 1930
- The attempt to overcome sectoralization in ministries of transitional existence, favoring the examination of permanent or almost permanent macro functions
- The use of new sources and data
- The introduction of themes related to dimensions and representations of the modern state

This last aspect allows us to conceive the very object of administrative history as social representation, that is to say as a collective construction of a set of symbolic images that introject values and establish mental predispositions and reflective attitudes in the individual and collective treatment with the various categories that account for the relations between the State and Society – citizenship, authority, sovereignty, democracy, etc. Thus, the history of the State is the history of its institutions and the appropriation that citizens make of them, between practices and representations (Lustosa da Costa 2010, p. 38).

# History of Public Law

Alison Staudinger
University of Wisconsin-Green Bay, Green Bay, WI, USA

## Synonyms

Constitutional and administrative law; Government law

## Definition

Canon law: Religious code and doctrine, especially Roman Catholic.
Private law: Law that concerns relationships and claims that do not involve the government or citizens in their civic capacity.
Liberalism: A theory and practice of government rooted in private property, negative individual rights, and limited government.
The public good: A shared vision of flourishing for the entire political community.

## Introduction

Public law concerns the relationships between citizens and governments and rules that govern how public institutions work. This simple definition is complicated by the variation and complexity of public laws and how the development of public law has varied greatly among different countries and their associated legal traditions. Those states with a common-law tradition may have public law that intersections and overlaps private law, while civil law often include two separate systems of law for public and private. In both types of system, defining what public means is complicated. It might mean simply legal matters concerning entities that are themselves public; while this is simple when considering purely governmental entities, it is difficult to separate out when private or civil society actors act in a public capacity or in coordination with a public entity. Or the concept of the public may have a normative and shared conception of a legal and political order and its incumbent sense of flourishing. To understand some of these tensions, the development of public law in relation to broader material trends and the history of political thought is useful.

In general, administrative and constitutional law form the two central categories of public law and shape public institutions and the behavior of public officials. Within these categories, and sometimes overlapping, are other domains like civil liberties or criminal law and particular instantiations in a place or system like European Union law or international law. Although the development of public law follows a broad growth narrative of secularization and judicial creep into broader areas of society and politics, recent developments challenge this narrative as the boundaries between public and private law are blurred, both conceptually and by global development. The future of public law, both as it exists in the world and as a subject of intellectual inquiry, is uncertain given the pluralistic sources and the mutual imbrication of the public and private that continues to gain in complexity.

## Religious Roots of Public Law

Although it is perhaps premature to label it public law as such, the Code of Hammurabi, from approximately 1750 B.C.E., did lay out a set of punishable offenses and their punishments. By virtue of its circulation and consistency, these codes, preserved on clay tablets, regulate the behavior of citizens and government, particularly about crimes and property disputes. There are many such early legal codes, most of which are produced by systems of early kingship and, as such, often focus on the behavior of citizens to the exclusion of checks on power.

It is with the development of Ancient Greek and Roman law that law's public character blossoms. The Roman notion of the *res publica*, the root of republican government in Western political theory at least, is an early conceptualization of central justification for public law as a concept or independent body of rules. That there might be a "public thing" that concerns a society communally, rather than private citizens or leaders only, was defined by Cicero in his dialogue *De Republica* (2013) as resulting from the unity of the people around a shared conception of justice. For Cicero, law must be respected because it reflects the divine sources of natural law and contains moral guidance for a good life. Cicero's conceptions of laws codeveloped with the actual laws of the Roman Republic, codified in the Twelve Tables of 449 B.C.E. which, despite many rules that seem harsh today, did reflect the notion that citizens are equal before the law. The Roman tradition of expanding citizenship opportunities to conquered people also contributed to the notion of law as productive of political relationships and citizenship itself. Although Cicero and others argued that an implied constitution contained in these and other roman traditions and precedents, this belief was sorely tested by the rise of the Roman Empire, even as these early emperors made reference to such a constitution. The Emperor Justinian compiled a digest of 50 volumes of Roman law in the sixth century, and in this compendium public law is understood as that relating to the administration of the

Commonwealth – and served as a model for some later German legal codes.

The Roman Republic is strongly identified with the development of public law in part because Ancient Greek laws, including those of Athens, included only very minor distinctions between public and private lawsuits in the fourth and fifth centuries. There may be in Aristotle's theories of citizenship, expressed in *The Politics* (1985), some antecedents for the Roman conceptions of republican involvement in public life. For Aristotle, the constitution of a state was the combination of the institutions, habits, and citizens of a particular regime and the understanding of justice at which this regime aimed and whose interests it served. Laws could and would change the orientation of a society but only in relation to the rest of their constitution; for example, one might draw lots for public positions in an attempt to increase the possibility that citizens would "rule and be ruled in turn." Each Greek city state had its own expression of public law, making speaking of Ancient Greek public law as a whole difficulty; however, the fourth century system in Athens is one of the better known and includes a system of popular courts and specialized trials for different aspects of justice. Just as in Aristotle's theories, the citizens as a whole were eligible for this work; of course, the Greek notion of citizenship was much more limited than the Roman and, as in Aristotle, relied on an opposition between the free public person in the agora and the private woman, slave, or laborer in the household.

While the Roman and Greek models were often important to later scholars in finding justification for public law and its limitations on power, the formation of legal traditions itself happens in clearest relation to the rise and fall of Christianity in the Medieval world. After the Roman Empire's collapse, developments of public law intertwine with religious law and the development of the nation-state. For example, papal bulls, issued by the Vatican since at least the sixth century, sometimes created institutions or public positions. Canon law emerged from the early Christian church and is legitimately understood as one of the earliest legal systems in Western Europe. Adapted from the Code of Justinian, canon law included the concept of a set of rules for the common good and regulated behavior of both church and congregant. While today we might consider canon law, still operative in the Catholic, Eastern Orthodox, and some Anglican structures, as nonpublic, it was initially developed when distinctions between Christendom and government in the West were difficult to draw.

Outside Western Europe, law was also intertwined with religion, as with Sharia or traditional Islamic law. After the death of Muhammad in A.D. 632, Islamic Caliphs codified and expanded on the interpretations of judicial matters that Muhammad has offered during his lifetime and developed a system of jurisprudence. The Charter of Medina served as a founding document and written constitution for Islamic law. However, public law was in this and in following jurisprudence often left open. One exception was the Ottoman Empire's legal code, evolving even in pre-Islamic times but codified after Constantinople fell in 1493.

## Public Law and the Early Nation-State

Both Christian and Islamic sources of legal relationships were intertwined with the development of the nation-state and the establishment of a system of sovereign political entities outside of their religious justifications, as well as the secularization of political power and legitimacy. For example, the Treaty of Tordesillas in 1494, prompted by the voyages of Christopher Columbus, established boundary lines in the Atlantic and included papal bulls as well as a lateral agreement between Spain and Portugal. And under Islamic law, the scribes or what we might call clergy, for much of its history, served a proto-representative function as a check on the power of the emperor or sultan.

The nation-state itself is rooted in theological concepts and legal rules. With the 1555 "Peace of Augsburg," early Europe responded to the growth of Protestantism and established that political boundaries should follow those of faith, so that

"each prince determined the religion of his subjects." The developing norms of sovereignty over a particular territory were linked conceptually to the legitimacy of faith. Of course, it was the Treaty of Westphalia, still seen as a central framer of the contemporary nation-state, which looms largest in the category of political developments that matter for public law. The Westphalian Treaty of 1648 is credited with framing the system of nation-state interaction we (arguably) still have today and with subordinating religious power to that of the state while still limiting the ability of state sovereigns. The treaty signals, with some degree of accuracy, the shift from unified Christian Europe to the contemporary anarchic state system, although as many have suggesting, identifying this shift with one moment may be too neat. Still, the eighteenth century saw much concurrence around a vision of public law as combining the positive rules that regulate state action in harmony with a national law, often religious, and also with laws between sovereign nations.

Public law and its complications highlight the ways in which the developing nation-state had various and sometimes competing goals. Some theorists viewed the state as directed towards a communal way of life for its citizens, either rooted in positive or natural law, while others began to describe the liberal state as an aggregator of disparate preferences of citizens seeking private goods. The Roman Empire fell in part as fourth and fifth century Germanic peoples, such as the Goths, and then later groups like the Vandals and then the familiar groups like the Anglo-Saxons invaded and settled in the Empire and began to develop from tribal societies into competitive kingdoms. These kingdoms were influenced by the Roman traditions and their relationship with the Church. By the time the papal dominance began to wane, in the fifteenth century, the offspring of these kingdoms were developed into kings who bean to proclaim their independence from paper rule. This notion was reflected in the writings of thinkers like Marsilius of Padua in the thirteenth century (2005), who explored the notion of secular authority in government. In light of the "Great Schism" where multiple applicants competed to be pope, kingdoms became independent political unites in their own rights.

Public law, at this point, became both about defining the borders and relationships of nation-states and expressing the absolutist notion of monarchy that dominated the development of European states until at least the eighteenth century. While a great deal of the kings worked hard to develop systems of vassaldom wherein feudal bonds held together and made possible the preservation and running of a kingdom, these relationships were focused on particular connections and localized regimes, rather than public law in a strict sense. Reynolds (1996) in fact argues that the Germanic tribes who developed this system had no concept of the "res publica," and instead this was a period of focus on autonomous local communities.

However, this changed, as did the character of public law, with the development of the hereditary monarchy and the consolidation of power in the late medieval period and the reinvention of the notion of a public good. Even some monarchs had agreements that protected their citizens, the most famous of which, of course, is the English Magna Carta – although the Spanish King Alfonso IX had a previous version. The Enlightenment, in the seventeenth and eighteenth centuries, along with large-scale shifts in economic processes caused by the Industrial Revolution, shifted the framing of public law in theory and deed.

There are also important theoretical sources for the development public law, such as Hugo Grotius, a sixteenth century legal scholar whose ideas about natural law still resonate today. Grotius, who is called the father of international law, wrote *On the Law of War and Peace* (2012) to explore the question of just war and advance a theory of nascent human rights. Samuel Pufendorf et al.'s. (1991) work was particularly important for public law in relation to public administration, because his theory of natural law included the idea that human nature is shaped by the roles and duties legally created – we create moral entities out of natural ones. Yet states were particularly important for Pufendorf and he advanced the

idea that their interests and rights superseded those of individuals. These two conceptions come together in the work of Henri Grégoire, priest and Jeremy Bentham early nineteenth century. Grégoire collected and described the way in which ideals such as nonintervention, self-defense, equality, and independence were supposed to function in a system of sovereign states. Bentham created a draft declaration about the independence of states, promoting the idea that laws or other legal documents could include notions of rights and duties – the content of public law.

Yet one last way to conceptualize the shift from the rather limited conception of the role of royal government towards a modern state that includes administrative capacity is the notion of "governmentality" that Michel Foucault offers (2009). For Foucault, the state becomes responsible for the well-being of the citizen and, indeed, their very soul. Foucault differentiates between juridical power and disciplinary power, the former indicating a set of formal power relations not reducible to public law or to law at all. For example, Foucault explores in *Discipline and Punish* (2012) the way in which punishment changes from a substantiation of the divine body of the king to an internalized set of produced behaviors that do not require enforcement but only imagined enforcement. This gives way in his later work to a concept of governmentality that also rooted in the diffuse nature of power as relational and rooted in knowledge regimes and what they make legible in a particular historical movement.

## Enlightenment Liberalism and Tensions in Public Law

Although the notion of the public good enshrined in public law has defenders in the enlightenment, this is also a period where liberalism is on the ascendant, and with it, individualism. Thinkers like John Jacques Rousseau (1997) championed the common good above all; indeed, for Rousseau (1997), the best social contract is one in which private interest is completely subsumed under the general will. Rousseau (1997) takes the earlier theological basis of natural law and shifts it to a purely political realm, rooting the state in principles of political right and self-government. This view echoes the conception of the city in Aristotle, and, as Rousseau 1997 notes, the Roman republican ideals of civically minded participants. Rousseau advises an intensive program of civic religion and myth building to attach individuals to public law and the state, a measure that began to appear as coercive as prominent liberals developed alternative notions.

These early liberals argued that the aggregation of private interests could, if managed in a system of limited government, serve as a proxy for the common good. For Adam Smith this was an economic good, produced through the workings of an "invisible hand" that responded to demand with the production of supply and set prices accordingly. No coordinating state was required to determine the common good; it was whatever citizens purchased and the protection of the system that make the invisible hand possible. John Locke saw the pursuit of individual (enlightened) self-interest as the basis of the social contract that made government possible and legitimated a government to protect the property rights that allowed private citizens to pursue their own life goals. Although public law retained its distinction from the purely private in these conceptions, it did not always retain a strong connection to the public good as such and to the notion of the publically minded citizen. Instead, it became about a way of governing a set of procedures that were to regulate these relationships.

Indeed, the US Declaration of Independence in 1776 is a powerful expression of the idea of recognizing and guaranteeing rights and duties between states and citizens, and the tensions that remained between the state as oriented towards a specific purpose and instead a set of processes and rules for conduct which admitted of many purposes. While the declaration itself is not a formal legal document, it grounds the notion of governmental legitimacy in both a theoretical basis in rights *and* in a legalize process of listing grievances. The fingerprints of Locke are

everywhere on this document, despite Thomas Jefferson's shift to "life, liberty and the pursuit of happiness" for Locke's blunter mention of property. Yet, along with Lockean liberalism, the Declaration suggests that government's protection of natural and inalienable rights is also a protection of popular sovereignty and rule of law, in part by indicating that Great Britain has failed by refused to pass laws "for the common good." Indeed, the notion that public law should not only express relationships between the powerful but in fact apply to citizen and leader alike is the most striking development of eighteenth century public law. This is also clear in the 1789 Declaration of the Rights of Man from France, which *explicitly* discuss law as "the expression of the general will" and, despite robust descriptions of rights and rule of law, frequently note the idea that they might be abrogated for the good of all.

## Constitutionalism

Although the eighteenth century formally kicked off an age of constitutional government, the first glimmers of this way of organizing public law come much earlier. As noted above, Aristotle used "constitution" to express the notion of a system of higher law as well as a way to express regime type. The Magna Carta, signed in 1215 in England, followed religious documents like the Islamic Charter of Medina as discussed above. All of these constitutions, or covenants, expressed the notion of a dual-system of law where one set of rules were higher than the other and therefore took precedence. They also began to codify, although not always in writing, the idea that higher law should check the power of the state. The Magna Carta was taken up in the seventeenth and eighteenth centuries by figures like Sir Edward Pope as a tool of critique of the monarchy, which claimed a divine right of kings. Although the Magna Carta initially regulated the relations between the crown and rich barons, Pope reframed it as a protector of the individual liberties for everyday Britons. This same framing inspired the American colonists, whose list of grievances included items like habeas corpus and trial by jury that many believed were guaranteed by the Magna Carta. The notion of a higher law that could be used to call power to account was transformative; when combined with the innovation of a written expression of the higher law, it became modern constitutionalism, now operative to some degree in nearly every country in the world.

Constitutional law creates the divisions of political power or branches in modern democratic states, in that both judicial and representative power emerge as function of the political, first in relation to ecclesiastical processes and then to the more secular development. As early representative bodies such as the assemblies of medieval England grew in formality, their power and autonomy increase. In tension with these development is the development of the first "rights" conceived of as potential checks on these political actors, although at the same time the creation or recognition of rights and their universality produced and circulated legitimacy for both right-bearing subjects and the states that recognized these rights.

After an initial boom in constitutionalism in the eighteenth century, as first Poland, then France, and eventually the rest of Europe wrote constitutions, often inspired by the US example; there was a lull until the early nineteenth century independence and constitution writing of much of Latin America. For example, Haiti had the second constitution in the western hemisphere, even before its revolution against the French, and then a sequence of new constitutions to match the many forms its government has taken since then, with a total of 24 with the last one approved in 1987. There was a spate of recreated or new constitutions of note written in the wake of World War II, including those written in part by occupiers in Germany and Japan and postfascist constitution making in Italy and soviet in the USSR. However, the bigger boom followed the independence of much of the world's former colonies, on every continent, first in the postwar period, but continuing on through the 1960s and 1970s.

## Administrative Law

Administrative law concerns the behavior of government actors in specific and includes rules as well adjudication and regulation. Agencies, tribunals, and committees make up the entities under administrative law, often organized as part of the executive branch, and things such as labor, tax, public utility, pollution, agriculture, and land usage restrictions are all part of administrative law, which is deeply intertwined with the regulatory state. Most common-law countries have processes of judicial review that include considerations of administrative law, such as through a due process protection in a constitutional or other documents. Civil law countries are more likely to have a completely separate system of adjudication of regulatory bodies and, sometimes, even nongovernmental organizations which function in the realm of governance. Administrative law was traditionally understood to function in relation to the democratically created legislation, but the notion that it merely translates legislative ideals wears thin. This is because members of the bureaucracy have a certain degree of discretion in how they apply their rules, creating a question of the legitimacy of regulatory regimes. Many theorists have questioned the role of bureaucracy in a democratic state, worrying that civil servants lack the public responsibility that other elected government actors may have (Waldo 2006).

Administrative law exists in part because of the increased expectations in the modern world that states will provide various protections and services to their citizens. Some of these relate to the rights guaranteed by constitutional law, as when administrative law regulates or makes access to education possible. Others, like the rules who govern workplace safety, the environment or food and drugs, came into existence after struggles by constituencies and policy makers, as well as legislation in many cases. These areas are often underneath the executive function of the government, which means that there is a certain discretion – varying by policy domain and the political salience of the issue, as well as, of course, the ability of citizens or other stakeholders to access and respond to policymakers. Administrative law sometimes serves to control bureaucratic excesses in that it can provide structures for exploring complaints or a lack of transparency.

In some common-law systems, judicial review of Administrative law occurs through the same channels as review of other types of law, with much variation depending on the particular history and priorities of each state. For example, Australia uses a modified common-law system though which many separate commissions and tribunals, rather than the general legal system, has the power of review. In a council of states system, like France's, the legal systems are entirely separate to preserve the separation of powers between the branches. Thus, the judicial branch cannot act on executive prerogative, but rather legal processes internal to the civil system of administration adjudicate. Other states do not have a "Council of State," which is the special body in France which rules on these cases and advises the executive branch but still have separate systems for administrative and other types of law.

As with constitutional law, administrative law is frequently created or enacted in complex and overlapping jurisdictions and policy domains. International bodies and the market integration often discussed as globalization force or allow states and policy-makers to adapt to a wider range of actors who matter, including international bodies like the World Trade Organization (WTO) or even supra-national bodies like the European Union (EU) which then, in some cases, have their own practices and officials of administrative law.

## Conclusion

Public law, on one hand, continues to be an important topic of study and set of rules, legislation and litigation, suffused through many levels and sites of policy-making on local, national, and global scales. On the other hand, it is difficult to precisely tease out the distinctness of public law itself given

this legal pluralism and the many diffuse sites at which either policy or even new legal rulings or norms can occur. Although scholars like Ran Hirschl (2004) have convincingly argued that, given the developments discussed in the last two sections above, there is a tendency towards "juristocracy," where elites use constitutionalism to insulate themselves from democratic impulses. Still, this shift of all political questions into legal questions may in part be a shoring of a notion of juridical rights and status that itself produces the subjects it purports to control.

H

## Synonyms

Black Americans; Community development; Venereal disease

## Definition

Sustainable housing, in general, has been defined in terms of whether an individual is currently housed or not.

## Introduction

For more than 35 years, HIV has affected millions of Americans, of whom more than 700,000 have died. Approximately 1.2 million people in the USA are living with HIV today. About 14% of the (1 in 7) don't know it and need testing (Minority HIV/AIDS Fund 2020). According to the Center for Disease Control, HIV Diagnoses are not evenly distributed. From 2014 through 2018, the annual number and rate of diagnoses of HIV infection in the USA decreased but continued to see increases in southern states (United States Department of Health and Human Services n.d.). Therefore, a plan was put into action to End the HIV Epidemic, "A Plan for America," which prioritized seven states that have substantial rural HIV burden. These states included Alabama,

Arkansas, Kentucky, Mississippi, Missouri, Oklahoma, and South Carolina.

The Jackson Metropolitan Area is considered the largest area in the State of Mississippi. Of the almost three million people living in Mississippi, about 161,000 live in Jackson, Mississippi. African Americans comprise about 82% of the Jackson population. Males account for about 46% of the community. Additionally, 27% of Jackson's residents live in poverty. About 16% of Jacksonians under the age of 65 do not have health insurance (United States Census Bureau n.d.)

Mississippi continues to experience high rates of HIV/AIDS infections despite all efforts to address this chronic condition. In 2018, Mississippi ranked number 7 among states with the highest HIV/AIDS diagnoses (Elfein 2020). As with the rest of the country, Mississippi men, who have sex with men, especially African American men, are at exceptionally high risk for HIV/AIDS, as are bisexual men and drug users.

Based on data retrieved from 2017, approximately 2614 people are living with HIV/AIDS. African Americans accounted for about 81% of individuals with HIV in Jackson, MS. As Fig. 1 highlights, 1.9% were Hispanic/Latinx, and 14.4% were White (AIDSVu n.d.). The number of African American males living with an HIV diagnosis in Jackson is 5.2 times that of White males. The number of African American females living with HIV/AIDs is 10.2 times that of White females with HIV/AIDS in Jackson, MS (AIDSVu n.d.).

In September of 2019, CDC published an Issue Brief, "HIV in the Southern United States," where they stated that southern states accounted for an estimated 51% of new HIV cases annually (Centers for Disease Control and Prevention 2019). Like the rest of the country, the vast majority of HIV diagnoses in the South occur in urban areas. However, the South has a higher proportion of new diagnoses (24%) in suburban and rural areas than other regions in the U.S., which poses unique challenges to HIV prevention, primary care, and supportive services efforts. (Centers for Disease Control and Prevention. HIV Surveillance in Urban and Nonurban areas through 2017 (slide set). Available at https://www.cdc.gov/hiv/pdf/library/slidesets/cdc-hiv urban-nonurban-2017.pdf. Accessed November 13, 2020.)

This submission aims to understand the plight of African Americans living with HIV/AIDS, who reside in urban communities like Jackson, Mississippi and focuses on the complex nature of the

**HIV/AIDS and Urban African Americans in Housing Sustainability: The Case of Jackson, Mississippi, Fig. 1** Jackson Residents Living with HIV/AIDS based on Race

problem: urban African Americans with HIV/AIDS in Jackson, Mississippi, regarding housing sustainability. First, an overview will be provided of the housing challenges in urban areas for African Americans living with HIV/AIDS. Next, housing programs will provide insight into addressing housing sustainability for urban African Americans with HIV. Lastly, the discussion explores how sustainable housing plays a role in providing a needed service to these urban African Americans infected and affected by HIV/AIDS. Urban African Americans, who are living with HIV/AIDS, require long-term engagement for sustainable solutions, which leads to the receipt of needed services, such as housing, care, and treatment.

## Sustainable Housing

Sustainable housing is the process of less waste, more recycling, and re-use of materials to lower the environmental impacts and costs. Some benefits of sustainable housing are health, warmth, comfort, and investment. According to Grieb, Davey-Rothwell, and Latkin (2013), stable housing is a house or an apartment that an individual either rents or owns. Unstable housing includes renting a room in someone's home, living with someone for free, living on the street, and living in transitional, recovery, or drug treatment house.

The association between housing and HIV/AIDS has been widely demonstrated across settings, samples, and time frames. The HIV/AIDS epidemic among African Americans is complicated. Still, the disproportionate rates of lower socioeconomic status and poverty among African Americans enable individual- and structural-level risk factors for HIV and creates barriers to access for health care services (Grieb et al. 2013). National surveys have demonstrated that people with unstable housing have more inadequate access to health care than the general population with stable housing (Grieb et al. 2013). Having a regular medical care source is one of the strongest predictors of access to health care services in general.

Persons living with HIV/AIDS (PLWHA) often face tremendous discrimination when searching for decent, safe, and affordable housing. This discrimination occurs regardless if the individuals are using public and private housing programs, purchasing a home, or renting in a housing unit. For example, in focus groups with persons living with HIV/AIDS, Bonuck and Drucker (1998) found that discrimination because of HIV seropositivity and experience with the criminal justice system or drugs posed formidable barriers to obtaining and maintaining housing. Also, Brooks et al. (2004) found that although most unemployed PLWHA, about 74%, were thinking of re-entering the workforce, an overwhelming number (66%) feared workplace discrimination. Since discrimination impacts a PLWHA to obtain and keep a job, housing options become limited.

The literature has revealed the importance of housing for PLWHA, but it has been noted that providing housing for PLWHA can be challenging and expensive. Nevertheless, such strategies are essential to pursue because individuals benefiting from dedicated housing for PLWHA are likely to experience reduced stress, and therefore likely to have improved health, mental health, and social support networks such as emotional support from neighbors in similar circumstances; moreover, they are likely to have increased ability to increase medically adherent (Derose et al. 2010). From a societal perspective, providing housing services for low-income PLWHA may be cost-beneficial as the healthcare system's savings may offset housing costs. The costs to the health care system of ongoing HIV transmissions and HIV treatment failure are substantial. Furthermore, providing housing services may have synergistic effects on other aspects of people's lives. For example, it is much easier to maintain employment if a person has stable housing, and it is easier to access medical services and adhere to medication regimens. Finally, individuals' psychological state may also influence their housing status. Homeless or unstably housed people must focus on day-to-day survival; therefore, competing needs may be challenging to deal with a chronic illness like HIV/AIDS.

## Urban African Americans Living with HIV/AIDS

Housing is a fundamental human right paramount for individuals' dignity, survival, and ability to increase their health outcomes. It is well established that housing is significant for HIV prevention and the health of PLWHA. Stable housing supports prevention and primary care efforts as it reduces drug usage, reduces situational sex in exchange for security, and increase access to mental health and other social assistance. The federal government recognizes housing's crucial role to people living with HIV in the National AIDS Strategy (White House Office of National AIDS Policy 2020).

Some solutions to the problem of housing for PLWHA would be to address the structural and institutional barriers to housing for persons living with HIV. By addressing the barriers, persons living with HIV/AIDS are provided an opportunity to become part of the decision-making process. Consider the needs of women and children who may be impacted and reduce barriers that may cause social isolation. It can be helpful to look beyond HIV-related housing for women and families. Women who have experienced challenges such as domestic violence, pregnancy, incarceration, and substance have options available. The available opportunities are also short-term alternatives but not permanent solutions.

In the Mississippi Jurisdictional Plan, housing was identified as one of the resources that person living with HIV/AIDS were unable to access. The Mississippi Jurisdictional Plan is a document developed out of the work of the Mississippi HIV Planning Group (MSHPG) for HIV Prevention to establish and assist the Mississippi State Department of Health (MSDH) in its HIV prevention process. MSHPG members consist of representatives from state and local agencies, non-governmental organizations, and individuals at risk for or affected by HIV. Identified barriers for PLWHA include limited access to housing assistance, the lack of housing assistance, and limited access to reliable long-term housing (Mississippi State Department of Health 2015).

## Programs to Support Urban African Americans with HIV/AIDS

Despite the need for a housing program to increase the health outcomes of a person living with HIV/AIDS, several programs are available in the Jackson Metropolitan area. However, these programs do not fully address the housing needs of persons living with HIV/AIDS. The Housing Opportunities for Persons with AIDS (HOPWA) Program was established under the AIDS Housing Opportunities Act (42 U.S.C. 12901) in 1990 and amended by the Housing Community Development Act of 1992 (United States Department of Housing and Urban Development n.d.)

Persons living with HIV/AIDS can apply for assistance through the Housing Opportunities for Person Living with AIDS. This program was established to provide housing assistance and related supportive services for low-income persons living with HIV/AIDS and their families. There are two types of grants awarded under the HOPWA program. HOPWA formula grants are made using a statutorily mandated formula to allocate approximately 90% of HOPWA funds to eligible cities on behalf of their metropolitan areas and eligible states. HOPWA competitive funds are awarded based on a national competition (United States Department of Housing and Urban Development 2020).

The HOPWA Program is the only Federal program dedicated to addressing the housing needs of persons living with HIV/AIDS and their families. The program provides States and localities with the resources and incentives to devise long-term comprehensive strategies for meeting the housing needs of low-income persons with acquired immunodeficiency syndrome and their families. Through the Mississippi HOPWA program, 542 individuals received housing assistance in 2015. Among HOPWA clients served in 2015, 79% were African American, 63% were male, and 49% were between 25 and 44 years of age (State Of Mississippi n.d.). Females, despite race, only comprised 37% of individuals who receive HOPWA services.

In Mississippi, tracking a person living with HIV/AIDS in relation to their housing status is a

very complex problem. One way of monitoring housing status among this population is through the Ryan White HIV/AIDS Program (RWHAP) Annual Client-Level Data Report. Approximately 8% of RWHAP clients have temporary housing, and 5% have unstable housing. In the RWHAP, people with temporary or unstable housing consistently have lower retention into care and viral load suppression. Retention in HIV medical care includes people with HIV/AIDS, who had at least one OAHS visit by September 1 of the measurement year, with a second visit at least 90 days after. Viral suppression refers to the most recent viral load test result of <200 copies/mL compared with people with stable housing (Health Resources and Services Administration 2019). In 2018, 4353 persons were living with HIV in Mississippi who received services through a Ryan White Program, of which 95.3% indicated they had stable housing, 2.4% indicated temporary housing, and 2.3% stated that they had unstable housing (Health Resources and Services Administration 2019). Yet, only 84.5% of those patients were retained into care.

The HOPWA program is administered by the Development Assistance Division (DAD) in the Office of Housing and Community Development, which receives annual formula grants from the US Department of Housing and Urban Development (HUD). DAD contracts with three (3) Project Sponsor(s) to deliver service, serving Hinds, Copiah, Simpson, Rankin, and Madison Counties areas. The Mississippi Home Corporation (MHC) in Jackson, MS, is currently funding two agencies to provided HOPWA. These organizations are Grace House and Mississippi United to End Homelessness (MUTEH). These agencies' services are short-term rent, mortgage and utility-tenant-based rental assistance, permanent housing placement, short-term housing, and master lease.

Different housing programs help individuals based on their specific needs. Despite the availability of programs to support housing for persons living with HIV/AIDS, individuals may still choose to forgo these services due to stigma and disclosing their HIV status. The Eligibility requirements are the conditions one has to meet to be considered for a specific housing program. If they do not meet these requirements, they do not qualify and will not be considered for the program. It is important to know that, even if these individuals meet all of a program's eligibility requirements, they may not be accepted into the program (e.g., they may not have space). Some of these eligibility requirements include but are not limited to:

- Income level
- HIV status and stage of their illness
- Age
- Gender
- Criminal Record
- Other health issues, such as mental illness or substance abuse

In the South, there is still a stigma associated with HIV. Even when individuals utilize housing programs, the landlord may discriminate against them because of their race, sexual orientation, physical disability (including HIV), or income source.

## Conclusion

The HIV/AIDS crisis resonates as a deadly reminder that it is disproportionately impacting African American communities. The available data indicates a strong correlation between the risk for HIV transmission for PLWHA and housing status. PLWHA in urban communities, especially African Americans, combat more than just health challenges. The acquisition of sustainable housing presents an immense challenge for PLWHA. Barriers to sustainable housing in urban areas, like Jackson, create drastic issues, including limited access to health care and increased drug abuse and risky sexual behavior. Housing services and options provide an opportunity for widespread HIV prevention services and information.

Furthermore, data collection regarding sustainable housing for African Americans who have HIV/AIDS contributes to understanding the phenomenon. Even though data collection methods are available for urban areas, like Jackson,

obtaining current and accurate data remains a challenge. The limited access to recent data impacts both government programs and nonprofit organizations' ability to address sustainable housing for PLWHA successfully.

Several short-term solutions are available from nonprofit organizations and governmental organizations. However, long-term solutions are necessary to transform the housing status for PLWHA in urban areas adequately. These long-term solutions must tackle the housing needs of PLWHA, especially in places like Jackson, Mississippi. Subsequently, an evaluation of available programs should ensure that they are adequately addressing the housing needs and providing specific outcomes that ensure that PLWHA has a place to call home.

# Homeless and Social Policy, The

Cara Robinson
College of Public Service, Tennessee State University, Nashville, TN, USA

## Synonyms

Destitute; Displaced; Houseless; Itinerant; Unhoused

## Definition

an individual who lacks housing (without regard to whether the individual is a member of a family), including an individual whose primary residence during the night is a supervised public or private facility (e.g., shelters) that provides temporary living accommodations, and an individual who is a resident in transitional housing." A homeless

person is an individual without permanent housing who may live on the streets; stay in a shelter, mission, single room occupancy facilities, abandoned building or vehicle; or in any other unstable or non-permanent situation. – United States Department of Health and Human Services

## Introduction: The Problem of Homelessness

Homelessness is the state of not having a permanent, safe, adequate residence. The problem of homelessness, however, is much more complex. Today, over 750,000 individuals are homeless on any given night in the United States (Department of Housing and Urban Development 2015). Some of these individuals are homeless for that night alone, many are homeless for weeks or months at a time, and a few are chronically homeless. The paths that led these individuals to homelessness are built on joblessness, familial breakup, medical expenses, domestic violence, mental health conditions, substance abuse, etc. Individuals find themselves homeless for a variety of reasons; therefore, the solutions to solving the homelessness problem are as complex and diverse as the issue itself.

The problem of homelessness has existed in modern society for centuries. Street rat, vagrant, and hobo are a few of the names the homeless have been called throughout this time. Modern homelessness became a key issue in the American public sphere during the 1970s and 1980s due to its growth in many inner city neighborhoods. A combination of the closing of state-owned mental health facilities, a rise in the abuse of hard street drugs, the significant number of veterans returning from Vietnam without adequate support systems, and the loss of wages due to the decline in stable, union blue-collar jobs created a convergence of social factors leading to a growth in homelessness.

### What Is Homelessness?

Homelessness has many faces. The National Alliance to End Homelessness distinguishes between the following populations: chronic homelessness, families, veterans, youth, rural homelessness, domestic violence, mental/physical health, and prisoner reentry. One group of homeless citizens that have received targeted attention over the past decade are the chronically homeless. To be chronically homeless, one must be an unaccompanied individual (not a family) that has a disabling condition who has been homeless for one continuous year and/or four times in the last 3 years. The national rate of chronic homelessness is 10% (of the total homeless population).

### Institutional Landscape

Homeless citizens seek services from agencies ranging in size from small volunteer-based faith--based food closets to large affiliates of multinational nonprofit organizations. The unique diversity of agencies serving the homeless lends itself to a wide range of employee qualifications, educational attainment, and previous experience. For example, church volunteers at a faith-based food closet will most likely not have formal education in organizational leadership, public policy, or human services. They are also less likely to be fluent in the processes of public benefits administration and eligibility. The diversity of agencies within the homeless service sector does benefit individuals facing unique issues and, therefore, seeking unique options for treatment, housing, and supportive service delivery. Moreover, all sectors (nonprofit, public, and private) are increasingly involved in providing services for homelessness (Levinson and Ross 2007). Specifically, many homeless clients are receiving benefits from social service agencies in state and local government agencies. Public mental health, substance abuse, housing, veterans, and human service agencies as well as nonprofit street outreach, mental health, counseling, educational training, and housing agencies all serve homeless citizens. The private sector also participates in homeless service provision in health care, housing, counseling, and employment. This diversity necessitates the enhanced efforts at agency coordination currently taking place in Continuums of Care (CoC) across the nation. These efforts are aimed at integrating services between all agency types to ensure clients have access to accurate information and pathways toward assistance.

## Who Are the Homeless?

Homelessness does not discriminate. Men, women, and children of every race and religion facing a diverse number of health and economic needs experience homelessness each day. This diversity further necessitates the need for cross-agency and cross-sector service coordination (Jencks 1995). This collaboration includes the elimination of some geographic boundaries as homeless individuals experience transient lives; therefore, many seek services from city and suburban districts during the same day or week. The more intensive and comprehensive the regional collaboration of providers, the better the ability to meet needs and avoid duplicative service delivery. These delivery systems are constantly changing as information regarding client needs and demographics are being collected and analyzed. Moreover, professional training is being modified to ensure that staff can better serve clients facing unique challenges through culturally competent and appropriate procedures (Finfgeld-Connet 2010).

As previously alluded to, over the past 30 years, researchers pinpointed specific categories in homeless client diversity – type of homelessness (Burt et al. 2001). Type of homelessness refers to transitional, episodic, or chronically homeless. Transitional homeless clients are individuals or families in short-term homeless situations due, most often, to an unforeseen economic or familial event which temporarily displaces them. The transitional homeless are best served through a combination of temporary housing placement with concurrent referrals to public aid, employment opportunities, and/or other case-specific needs (e.g., legal services, credit counseling, rental assistance programs). Individuals and families considered episodically homeless experience consistent, medium incidents of homelessness often created by entrenched, long-term economic, health, familial, and/or legal concerns. The episodic homeless individuals and families need transitional housing placement (6–12 months) accompanied by wide-ranging supportive services and case management. Finally, the chronically homeless are those individuals who have experiences 1 year of homelessness and/or four bouts of homelessness in 3 years and have an accompanying disability. Qualifying disabilities include physical and mental disabilities as well as HIV/AIDS and substance abuse addiction. The chronically homeless are individuals who require long-term, often permanent, housing placement with broad supportive services, medical care, and case management. Single males between the ages of 30 and 60 constitute the majority of chronically homeless clients. The large majority of the chronically homeless have co-occurring mental health and substance abuse disabilities and have spent years in and out of homeless and housing programs as well as hospitals, treatment centers, and jails.

Due to the Great Recession in the United States (2007–2010), the fastest growing homeless demographic are families with children. Job losses coupled with lost housing equity, lack of savings, and crippling household debt, many working and middle class families fell into homelessness during and following the Great Recession. The robust economy and housing markets of the 1990s and much of the 2000s resulted in a significant number of families living with seemingly stable incomes without the accompanying stable savings. The harsh blow of the Great Recession helped swell the numbers of the homeless ranks. These clients usually face transitional homelessness and were specifically targeted by the American Reinvestment and Recovery Act of 2009 through the Homeless Prevention and Rapid Re-Housing Program (HPRP) administered through the Department of Housing and Urban Development (HUD). HPRP focused on preventing homelessness before it occurred by providing eligible clients with monies needed for rent, arrears, legal fees, utility fees, and other items contributing to the threat of homelessness. The rapid rehousing portion of the program focused on getting clients into long-term, stable housing right away rather than emergency shelter or transitional options.

Another population facing increasing rates of homelessness are veterans. The economic and medical effects of the wars in Iraq and Afghanistan created a new subpopulation among veterans. Veterans face unique needs, and collaborative

efforts between the Veterans Administration and social service organizations are imperative to ensure that an appropriate plan of action is established for each client.

### Homeless Service Systems

HUD divides the country into Continuums of Care (CoC) jurisdictions. These jurisdictions range from large cities (e.g., Philadelphia) to entire states (e.g., Delaware). The CoCs are in charge of planning for homeless services in their respective communities. Each CoC also coordinates the application for federal HUD homeless service funding (a large chunk of funding for homeless services in each community). The governance of CoCs differs greatly. Some CoCs are governed by a 501©3, others by a government entity, and still others by a loose nonofficial affiliation of providers. The difference in governance is accompanied by large differences in activity.

CoCs were developed as part of the McKinney-Ventro Act which was the first major legislative action focused on homelessness and homeless service delivery. The Act was established in 1987 and created fifteen programs for homeless programming. In FY 2015, the McKinney-Vento Act programs allocated $1.6 billion in total funding to CoCs across the United States. McKinney-Vento remained the only major homeless service legislation until the passage of the Homeless Emergency Assistance and Rapid Transition to Housing Act (HEARTH Act) in 2009. The HEARTH Act altered the management structure of homeless programs while expanding homeless services and operational definitions of homelessness. In addition to the programs offered via the McKinney-Vento and HEARTH Acts, homeless citizens rely heavily on public benefits and the War on Poverty programs for medical, monetary, and food services.

To address the changing environment and provide more local resources to meet the increased need, critical support was provided by the American Recovery and Reinvestment Act of 2009 (ARRA), through the introduction of the Homelessness Prevention and Rapid Re-Housing Program (HPRP). HPRP provided an unprecedented $5 billion dollars of 3-year time-limited assistance for local communities to prevent and rehouse people experiencing homelessness. These funds coupled with existing Continuum of Care (CoC) resources and other stimulus program funds comes with an even greater need to measure the impact of this new assistance on how communities deliver homeless services.

Homeless clients face varying and unique needs; therefore, assistance programs must develop systems allowing the homeless to access diverse services to meet those specific needs. Within CoCs, largers agencies are able to provide a plethora of those services on-site or within the organizational structure. CoCs rely on the coordination amongst large and small agencies alike to ensure equitable access of those services. Within any given CoC, one organization may serve as the lead agency for the provision of substance abuse counseling while another is the primary provider of domestic violence counseling. This coordination is built by breaking down sectoral boundaries or 'silos' of service delivery. Over the last ten years, one of the ways in which CoCs have tried to break down those boundaries is though the federally-mandated Homeless Management Information System (HMIS). The HMIS is a CoC-wide database utilized by all HUD-funded agencies which collects information on the clients they serve. This data collection streamlines the intake process while, concurrently, providing jurisdiction level information on homelessness and service needs. This process aids planning, funding allocation, and program improvements.

### Homeless Management Information System (HMIS)

With the advancement of computer technologies in the 1990s, several academic researchers and policy leaders began to envision a coordinated system of data collection for homeless service delivery. This coordinated system ideally links agencies and streamlines the registration process for clients while also providing communities with longitudinal data about the usage of services within their Continuums. The longitudinal data could help communities design systems better suited to serve clients (i.e., pinpointing programs gaps for subpopulations) and save costs

(i.e., reducing duplication of services and maximizing cooperative efficiencies). However, HMIS numbers reflect the diligence in which service providers enter data.

In 2001, Congress directed the Department of Housing and Urban Development (HUD) to begin the process of mandating HMIS implementation in all Continuums of Care across the United States. All jurisdictions were asked to have a functioning system by 2004. As a result, many street bureaucrats faced a new, and potentially overwhelming, task as communities were forced to forge ahead. A prescribed template for HMIS implementation was not mandated and discretion was left to localities. While federal monies were made available to lift the cost burden of implementation (e.g., software purchase, training, staff salary, etc.), some jurisdictions chose not to take monies away from direct service in order to enhance HMIS capacities. Some CoCs simply get together to coordinate and submit the federal funding application, while others conduct research and advocacy efforts for the entire jurisdiction. These differences can create difficulty when mandates, such as the one to create a HMIS, are required of the CoC.

### Cost of Homelessness

Cities across the nation conducted cost studies and found that, depending on the population served, the cost of providing services for a homeless person is higher or pretty much the same as the cost of providing housing coupled with services for that person. Especially studies that focused on high utilizers of ER and hospital services, medical detox, and jail systems found significant cost savings in providing permanent supportive housing (housing plus case management) for these individuals.

By definition, the chronically homeless have a long-term health condition which contributes to their homelessness (e.g., mental health diagnosis, substance abuse addiction, physical disability, HIV/AIDS). The most ambitious and comprehensive attempts to house the most vulnerable of the country's homeless in long-term, permanent housing with ongoing, wrap-around supportive medical and health services focus on cost savings. This model of housing delivery for the chronically homeless has been shown to reduce costs for homeless service providers, hospitals, rehabilitation/treatment facilities, and other stakeholders (e.g., jails). For example, in Los Angeles, studies found that this model saved communities $42,000 per client in 1 year. In addition, these services have proven success in serving homeless citizens. In New York, 18-month post-housing placement, 84% of clients with substance abuse addiction served by one housing first program maintained their housing placement (Morgenstern 2010). The How's Nashville campaign links homeless citizens with targeted health services while reducing system costs. Analyzing its success while identifying areas for improvement will help ensure that future phases of the campaign will continue to strengthen the homeless service community's capacity to provide appropriate services to clients.

## Conclusion

The policies and programs governing homeless service delivery are a complex web of partners, organizations, public benefits, landlords, and government agencies. This complexity mimics the complexity of homeless citizens themselves. To this end, it is imperative that individuals working across homeless service arenas are well educated on the complexity of issues, policies, and programs to better ensure the appropriate provision of services.

# Homelessness Among Persons with Disabilities in Urban Areas

Abu-Sadat Rabbi
University of Education, Winneba- Ghana, Winneba, Ghana

## Synonyms

City; COVID-19; Destitution; Differently abled persons; Disability; Disabled persons; Gender; Pandemic; Vicious cycle; Zones

## Definition

Homelessness is defined as living in housing that is below the minimum standard or lacks secure tenure. People can be categorized as homeless if they are living on the streets (primary homelessness); moving between temporary shelters including houses of friends, family, and emergency accommodation (secondary homelessness); living in private boarding houses without a private bathroom or security of tenure (tertiary homelessness).

## Introduction

In urban areas, homelessness is a growing global problem affecting millions of people. Homelessness means a group of people with extreme lack of access to housing or access to housing rights, requiring people to leave their homes and some belongings. The poor and other disadvantaged groups are forced to live on the streets, which is detrimental to human development. The World Report on Disability (2011) reports that between 15.6 and 19.4% of the global population is made up of people with disabilities. The ratio is higher at 18% of the population in lower-income countries compared to 11.8% in higher-income countries. Thus, there are more than 1 billion people with disabilities worldwide. In most low-income nations, this estimate of individuals with disabilities is made poor and homeless. The WHO CBR guidelines (2010) note that for persons with disabilities, the cost of renting suitable accommodation can be higher than for others. This leads to an increase in the everyday living expenses of persons with disabilities with little or no jobs, driving them into the streets and homelessness. When persons with disabilities leave home to attend school, seek jobs, or start a small business in another place, accessible accommodation can also become an issue. People with disabilities may not be able to afford or use the accommodation available because it is inaccessible or because of financial difficulties. This entry discusses the issues of homelessness in urban communities, particularly among people living with disabilities, its causes and consequences, and the intersection between disability and homelessness.

## Concept of Homelessness

Globally, the United Nations reports that over one billion people worldwide need shelter. 100 million of these people are homeless without housing. In 2014, Madrid had about 1905 homeless people in the capital city of Spain. An estimated 1141 of them slept either in care centers or public shelters and 764 disbursed their sleeping room on highways (Panadero and Vázquez 2016 cited in Opare 2018). Homeless people are seen as deviants because they withdraw from the standards of society, drill through trash, beg for alms, and sleep in the open outside. However, this may not be a benchmark for their recognition since only the

undesirable side of homelessness is recorded (Boydell et al. 2000; Opare 2018). Housing that ties homelessness to "houselessness" is a common component in the concept of homelessness that runs through scholarly works (Springer 2000).

Homelessness is characterized differently by various nations. The definition of homelessness often relates to one's culture. Althusser (1974) cited by Opare (2018) attests that people in a community understand and act around the philosophies they have accepted in society. Shinn (2007) asserts that homelessness can be perceived as lacking social policy and social-cultural values and practices.

Shinn further states that in European countries and the United Kingdom, the fluidity and complexities of the definition of homelessness are based on people who are deprived of a residence. The subjective subcategorization of evaluations of people in need marginalizes and stigmatizes homeless people. Homeless people fear accessing agencies for assistance for fear of prioritizing them (Minnery and Greenhalgh 2007; Opare 2018). As a consequence of the lack of access to appropriate accommodation, Amore (2013) cited in Opare (2018) describes homelessness as living in sternly insufficient housing. A home exists in three "domains," according to the European Federation of National Organizations Working with the Homeless. Having a home constitutes having a modest dwelling (space), sufficient enough to satisfy the needs of the person and his or her family (Edgar et al. 2004; Opare 2018).

## Causes of Homelessness

Homelessness affects both the social, political, and economic phase of a nation. The origins of the problem must be dealt with or investigated before strategies can be drawn up. Homelessness is affected by systemic and individualistic variables (Anderson and Christian 2003). The systemic and individual vulnerability viewpoints have often been framed as diametrically. Beer, Baker, Lester, and Daniel (2019) point out that there are procedures and circumstances that put people at risk of homelessness not just on systemic and individual variables but also on institutional circumstances. These structural obstacles include laws and regulations that prohibit the tenancy of individuals under the age of 18 (Burt 1992; Wong 2013). These variables combine to cause homelessness (Pleace 2000).

The **systemic perspective** focuses on the perception of causes and influences associated with the increase in homelessness since the 1970s. The perspective on **individual vulnerability** focuses on personal characteristics and risk of homelessness among people living in insecure or marginal (Wong 2013).

In furtherance, the structural causes of homelessness emphasises that, the emergence and growth of homelessness is as a result of changes in societal forces that are beyond the control of individuals. Structural forces that are associated with the growth of homelessness and its spatial distribution include but not limited to: (a) Poverty (b) Natural disasters (c) Urbanization (d) Political Issues and Evictions (e) Unemployment (f) Lack of Affordable Housing (Wong 2013).

### Poverty

Poverty is inseparable from homelessness. People are more likely to become homeless without the resources to fulfill their basic requirements. In Opare (2018), Akindola (2009) defines poverty as the lack of economic resources that are necessary for the food, shelter, and clothing needs needed for one's physical well-being. Homelessness is often exacerbated by poverty, which is dictated by macro-level socioeconomic factors such as welfare programs, lack of affordable housing, and labor markets, causing people to go out and become homeless (Stephens and Fitzpatrick 2007; Lee et al. 2010).

### Natural Disasters

Natural disasters worldwide are unavoidable, increasingly becoming more frequent, expensive, and threatening. Many natural disasters have left millions dead, with the loss of their homes, and the rest homeless. Since the 1950s, the global economic rate associated with natural disasters has risen 14-fold (Guha-Sapir et al. 2004). In places of economic challenge and developing

countries, natural disasters have a complex impact as overcrowded areas remain homeless, an example of which is the 2004 Indonesian earthquake that displaced millions of people.

### Urbanization

The problem of homelessness has been advocated by urbanization. Half of the world's population resides in urban centers in cities (Bahns 2005). Urbanization is a transfer of people from rural areas to metropolitan areas with population growth (United Nation 2008; cited in Issifu 2015). Rapid urbanization poses an economic threat to poor and low-income earners and their health. The United Nations reports that Africa has the highest rate of urbanization, with an estimated annual increase of 4.0% (Huchzermeyer and Karam 2006) and 6% annual growth in urban population in African countries such as Ghana (Accra), Nigeria (Lagos), and Kenya (Nairobi) (Bahns 2005). The prevalence of rural-urban migration has driven rapid population growth in the urban centers of many developing countries (Agesa and Kim 2001). The manifestation of rural urban migration is triggered by socioeconomic forces that drive people into the streets of urban centers and render them homeless (Ajaero and Onokala 2013).

Numerous studies conducted by researchers such as Ajaero and Mozie (2011) have shown that insufficient wages, lack of productive and stable employment, and poverty are systemic factors that pull people from rural areas to urban centers in search of livelihood strategies by soliciting alms and cobbling up menial jobs such as shoe shining. McCatty (2004) argues that violence, weak infrastructure, and poor services such as sanitation and drinking water are the result of excessive urbanization. Most migrants arriving in urban areas lack formal education and are unqualified, thus not having the right requirement for employment. And often without any asset to grow any form of business, they become vulnerable and end up living on the streets (Awumbila and Ardayfio-Schandorf 2008) and are vulnerable to many health problems such as depression, rape, malaria, suicide ideation, and many others (Issifu 2015).

### Political Issues and Evictions

Homelessness is an indication that housing prices are not properly delivered. When state's political institutions fail to meet the requirements of the most disadvantaged individuals, people are left without adequate homes and taken to the streets to become homeless (Majale 2002). Thus social and political policies fail to address and respond effectively to homelessness issues as a national problem. In Ghana, for example, an eviction by the Accra Metropolitan Assembly (AMA) on 21 January 2011 on railway line structures in Accra could have made millions homeless. Habitat International Coalition (2011) prevented the evacuation, which defied the then incumbent government's initiative. President Mugabe's "Operation Murambatsvina" or "Operation Restore Order" left 2.4 million homeless in the clean up the cities move. Zimbabwe also saw a case of 700,000 displaced citizenry (Tibaijuka 2005). Instead of resolving the related problems causing homelessness in their region, governments address homelessness in the developing world to receive international aid and funding, and this leaves the homelessness phenomenon to increase (Toro 2007).

### Unemployment

Homelessness could exist as a result of a lack of employment, and income inequality is far from being improvised (Ajaero and Onokala 2013). Wright-Howie (2003) notes that unemployment is a structural proponent that pulls people to the street to end up as homeless people. In addition, Awumbila and Ardayfio-Schandorf (2008) added that unemployment is a product of a lack of knowledge and skills to obtain and maintain meaningful jobs, which can drag people into the streets and make them homeless. Most homeless people found on the street are young people who are unskilled and not well educated. Unemployment is often the product of the weakening of the economy, and as a result, the factors and causes of homelessness continue to exist and increase (National Coalition for the Homeless 2009).

### Lack of Affordable Housing

Homelessness is exacerbated by high housing shortages, which raise housing supply demands. This puts strain on the few housing supplies that do not fulfill people's housing needs, thereby making people homeless (Brux 2008 in Opare 2018). Other researchers, such as Lee, Price-Spratlen, and Kana (2003) and Quigley et al. (2001), have shown a shortage of affordable housing that leads to a high rate of homelessness in urban centers. Because of the high cost of housing, the inability to pay rents or buy housing pulls people into taking shelter on the street. In addition, GSS (2005) noted that only 43% of the population in Ghana owns a house and that one in ten Ghanaians has access to stable housing. This indicates that housing insecurity and tenure conditions exist with potential evictions among many Ghanaians that can make them homeless (NDPC 2006). There is a propensity for them to be pushed to the street where they become homeless if they cannot afford accommodation.

The perspective of **individual vulnerability** focuses on the identification of person-level and household-level characteristics. Certain aspects of relationships and individual dynamics can lead to the probability of an individual being homeless. Vulnerability to harmful aspects of homelessness is linked to individual factors, including drug abuse, family violence and trauma, personal crises, and those leaving parental homes at a young age (Caton et al. 2005, 2007; Wong 2013).

### Mental and Health Challenges

Mental health is a problem in life that can happen to anybody and can be episodic, relatively long, and temporary. Mental illness is a gateway to homelessness and can also intensify with persistent homelessness. Mental well-being may include depression, anxiety, paranoiac, hallucinations, schizophrenia, and bipolar disorders. These may lead to homelessness due to restricted family interaction, lack of social support and networking, inadequate preparation, alcoholism, substance abuse, frequent hospitality, cultural disparities in mental illness, poor care, and poor acceptance of mental distress (National Coalition for the Homeless 2009). Mentally ill people with a lack of social and economic benefits and family support are those at risk of homelessness. They may be pushed by their situation to live on the streets. Opare (2018) citing Forson et al. (2005) and Stefanick and Tsemberis (2007) suggested that mentally ill people are unable to form and sustain any relationship of stability as they are frequently mistaken to cause people around them to respond often deliberately and to drive families, friends, and caregivers away leaving them in a state of homelessness.

### Substance Use or Abuse

Many studies show that there is a correlation between drug abuse as an indicator and homelessness as an impact. Substance abuse contributes to the problem of homelessness as substance use kills friendship through addictive orders. These addictions will cause people to lose their jobs and homes and cause family problems, leading them ultimately to homelessness (Didenko and Pankratz 2007 in Opare (2018). Fisher and Roget (2009) also report that drug misuse frequently occurs concurrently with mental health disease. Without care, people with mental disorder turn to the street for drugs and self-medication and end up on the streets as homeless. The dependency on opioid use and drug misuse exhausts the financial reserves of individuals. The failure to pursue and use assistance for drug addictions drives them to the street (Embleton et al. 2013).

### Broken and Abusive Relationships

Broken and abusive relationships are individualistic variables that drive individuals to the streets, leaving them homeless. This contributes to the downward spiral that pulls people into homelessness when an important relationship is broken or ends. After divorce, some women are frequently vulnerable to homelessness and poverty as they lose approximately 40% of their economic stability (Boakye-Boaten 2008). In a study of homeless street children in South Africa, Ward and Seager (2010) confirm that many of these children were forced to the street and became homeless with the loss of either parent. 75% of street youth in Tanzania also reported that due to the death of their parents, they lived on the streets. Thus these

fractured marriages forced these kids to the street to survive, leaving them homeless.

### Family Violence and Sexual Abuse

Many individuals have endured family violence or sexual assault that forces them to leave and live on the street. Subsequently, 47% of homeless women researched reported sexual and physical violence as the justification for leaving home (Toro et al. 2007). Ferguson (2009) as quoted by Asante (2015) and Opare (2018) eludes that parents' use of drugs has intensified family violence, resulting in physical and sexual assault, causing young people to leave their homes and live on the streets at an early age. McCreary Centre Society (2002) and Bray (2010) report on prevalent family disturbance and childhood violence among street youth in Vancouver that led to their homelessness. They also cited the constant turmoil and tension at home pushed them onto the streets. It has also been pointed out that income affects housing choices as women and children who are deprived of an independent income are impacted by family abuse. Women and children impacted by family violence and sexual exploitation will become vulnerable to homelessness, if there is no independent income that affects one's housing choices.

## Types of Homelessness

Homelessness is complex in nature and is of a sort. The entry discusses the following three forms of homelessness;

- Chronic homelessness
- Episodic homelessness
- Situational/transitional homelessness

### Chronic Homelessness

They are people who live on the streets for a longer period of time and have little or no resources at their disposal to improve their condition. These people are crippled by mental health problems and opioid abuse. Unless assistance is offered by others, they are unable to improve their situation. Sometimes older and injured people who are homeless also fall into this group (Culhane and Metraux 2008 in Opare 2018).

### Episodic Homelessness

There are persons who during their lives encounter recurrent and ongoing homelessness events. They are more likely to face intricate problems including mental well-being, addictions, crime, and health and are often unemployed for a long period of time. They therefore have a high frequency in and out of shelters and a limited time there. Episodically, homelessness can be applied to someone who has endured homelessness for 3 or more years and is currently homeless.

### Situational or Transitional Homelessness

In this form of homelessness, due to some tragic conditions such as the inability to afford accommodation, lack of wages, service exhaustion, loss of the breadwinner of a family, unemployment, violence, and separation, a person becomes homeless for a brief time in their life. Before moving to or transiting into permanent housing, they spend a brief period becoming homeless and leaving their homelessness status with little to no interference.

## Homelessness in Ghana

A rather recent concept is the notion of homelessness in Ghana. Homelessness differs from the culture of Ghana because there is no word for homeliness in the language (DFID 2017 cited in Opare 2018). The Ghana Statistical Services recognizes and uses a criterion based on the quality of accommodation, which means that individuals who reside in roofed buildings are not homeless (GSS). Subjects related to institutional consistency or suitability are not evaluated, and the complex essence of homelessness is overlooked (Tipple and Speak 2004; Opare 2018). Ghana's homelessness stems mostly from housing deficits exacerbated by other causes, such as changes in the Ghanaian family structure, poverty, rural-urban migration, rapid population growth and urbanization, and housing shortages due to continuous government reform.

The issue of homelessness was not visible in Ghana until the present urbanization of the cities led to people migrating to the big cities in search for job opportunities. In Ghana, the home and family are used interchangeably; the breakdown of the extended family as a result of migration, urbanization, nucleation of families, and modern capitalist system has brought changes to the Ghanaian family system (Korboe 2000); and ethnic violence has given rise to the homeless phenomenon. It is a common sight to find two household families leaving under one roof however due to the above factors; there is a breakdown of social relations and a manifestation of high living cost for extended family due to the economic demands (Assimeng 1999). However the essence of homelessness is rather urban, as a result of the relocation of rural families and neighborhoods, where elderly people care for individuals; teach values, ethics, and knowledge of customs; and offer punishment and incentives, and the structured structure of social security to help keep individuals out of the streets is lost. Urban public spaces are avenues that provide the physical services that impoverished street people use to support their daily lives. Young people move to big cities and are not even able to take care of the elderly. When they take up residence on streets in major cities, the youth are at the leniency of this homeless phenomenon. Homeless people are most commonly relegated and viewed as "beggars" or "mentally ill," but only a rare number of homeless people participate in the act of soliciting charities. On the other hand, they were interested in some minor tasks and employment to earn their regular income in Ghana (Speak and Tipple 2006; Opare 2018).

## Gender and Homelessness

Gender is very reflective of the homelessness phenomenon as there is a distinction between how men and women experiences and copes with their homelessness situation, which lead not just to their pathways into homelessness but also as a means out of it. However in the state of homelessness, women are more vulnerable than men (National Coalition for the Homeless 2009).

A greater proportion of secret or unseen homeless people in the homeless subculture are more homeless women who may also have children in their care (National Coalition for the Homeless 2009). Women often don't turn to be rough sleepers than men. Men's homelessness is most often noticeable than not, as they are found sleeping roughly on open streets or in shelters compared to women's homelessness, which is obscured from the perspective of the public (Novac 2001). Homeless men are the largest number of the homeless population and unlike women, are not sheltered (The Annual Homelessness Assessment Report (AHAR) to Congress 2015). In contrast to their fellow homeless men, homeless women are more likely to suffer harassment and sexual and physical assault, turning to sleep in areas and places that are vulnerable to rape and attacks. Their weakness, substance use, and mental illness have a negative effect on the willingness of the person to be vigilant and self-conscious to escape risky circumstances (Wenzel et al. 2000). In addition, homeless women are more likely than homeless men to participate in sex crimes involving the commercial trade of sex for food and shelter in order to survive (Meanwell 2012). Another differentiation between homeless women and homeless men is their reproductive health. In particular, women face challenging reproductive health problems, such as monthly menstrual cycles and having to clean up, being pregnant, giving birth, and taking care of a baby on the streets, unlike men (National Coalition for the Homeless 2008).

## Persons with Disabilities and Homelessness in COVID-19

While the COVID-19 pandemic affects all members of society, the attitudinal, environmental, and structural barriers replicated in the COVID-19 response affect people with disabilities disproportionately. Many individuals with disabilities have pre-existing health problems that make them more vulnerable to virus infection, with more serious

symptoms following infection, contributing to higher levels of death. In the context of the COVID-19 crisis, persons with disabilities who are dependent on assistance for their daily lives may find themselves isolated and unable to survive during locking measures. People with disabilities often continue to face discrimination and other obstacles to access to livelihoods and income support, to engage in online education, and to seek protection from abuse. There are also greater threats facing particular categories of people with disabilities, such as inmates and those who are homeless or without appropriate housing.

Owing to overcrowded living conditions, lack of access to water and sanitation, and due to their pre-existing health conditions, homeless people with disabilities and those living in emergency shelters and informal settlements are especially vulnerable to COVID-19 contracting. Homeless people, including those with disabilities, were forced by the COVID-19 emergency to seek refuge and assistance, overcrowding emergency shelters and spreading the virus. People who because of their living conditions, do not comply with physical distance are also in a disadvantageous position (United Nations Human Rights Commission 2020).

In Ghana, due to their living conditions, the vulnerable, especially the homeless (including PWDs), are more susceptible to COVID-19 than any other category. The destruction of the homes of some of Old Fadama's slum residents (especially during the lockdown) meant that many, including children, had to sleep outdoors. This condition puts these people at greater risk of contracting the virus because they have little to no way of following the rules of social distance and little access to running water and other basic hygiene facilities. Although the Metropolitan Assembly of Accra vowed that temporary accommodation would be given to the displaced people, many are still sleeping on the streets as these temporary measures do not meet the basic needs of the homeless (Abu-Salia et al. 2015; Morgan 2020; Africanews 2020).

Homelessness reaction in the United States has been introduced by unique guidelines that provide a communication component of impairment. In Chile, the government has stated that it is strengthening its commitment to providing health services to homeless people on the streets. Over 1,000 beds have been built in a large facility in Argentina to provide emergency shelter for those who may need physical distance without high medical requirements (United Nations Human Rights Commission 2020). The point, therefore, is that relief from COVID-19 should be more inclusive of the homeless persons with disabilities and offer permanent interventions to any given community (Anadolu Agency 2020).

## Homelessness and Disability

To date, to a large degree, homelessness study has largely overlooked people with disabilities. Chamberlain and Mackenzie (2008) argued that the pathways to homelessness that affect people with disabilities vary from those of the general population, but the pathways have not been completely articulated by studies.

Globally, in the homeless population, persons with disabilities are overrepresented. Persons with disabilities are at risk of homelessness due to low wages, reduced labor market participation, and limited capacity in the private rental sector (Beer and Faulkner 2009). Importantly, however, people with disabilities are not a standardized category, and their paths to homelessness differ by form of disability, place and nature of their disability. It is therefore important to develop a much better understanding of the intersection between disability and homelessness (Beer et al. 2019).

## Homelessness and Disability in a Vicious Cycle

Counts of individuals in a group experiencing homelessness on a single night show that about a quarter of people with homelessness have a disability, including physical, intellectual, and developmental disabilities, as well as conditions of mental well-being and/or substance abuse. In reality, homelessness affects persons with disabilities overwhelmingly. Disability also leads to

**Homelessness Among Persons with Disabilities in Urban Areas, Fig. 1** Homelessness and disability in a vicious cycle

homelessness in a vicious spiral, and homelessness in turn generates or exacerbates impairments and external obstacles. The cycle of events is seen in Fig. 1.

Owing to the prevalence of institutionalization, inequality in access to care, insufficient housing and social assistance, a shortage of accessible and affordable housing stock, and cheap rentals, people with disabilities are at increased risk of being homeless and socially excluded.

## Effects of Homelessness on Persons with Disabilities

It is difficult to underline the impact of homelessness on persons with disabilities. Homeless persons with disabilities face discrimination, stigmatization, health conditions and challenges in obtaining healthcare, criminalization, and social isolation and lose job rights while living on the streets (National Alliance to End Homelessness 2009; Opare 2018). Chamberlain and MacKenzie (2006) conclude that unemployment is a social limitation for homeless people and that the lack of sufficient income and services prevents homeless people from achieving adequate accommodation and caring for their basic needs and living their lives at risk of communicable diseases, malnutrition, poverty, and even death. Often, homeless persons with disabilities are faced with various health problems criteria. The challenges faced by the homeless in accessing healthcare are due to the geographical position of the health service, mental health, timely access, low esteem, stigma and prejudice, fear, denial, and turmoil of life, resulting in a high risk of morbidity (Opare 2018). With several economic limitations, the homeless are at a disadvantage and are unable to finance their healthcare because income would impair their ability to receive healthcare services. It is also difficult for the homeless to access health services and care in the geographical location of health services, especially when they have to travel long miles and there is a need for transport that they can barely afford (Opare 2018). In various contexts, homeless people face more prejudice, stigmatization, and discrimination, including jobs, housing, education, and even access to healthcare, and these are the characteristics of their poor health (Opare 2018). Studies often indicate the negative effects of stigmatization of the homeless due to their feelings of shame, self-denial, depression, and suicidal thoughts (Barry et al. 2014). Philippot et al. (2007) suggested that groups that are frequently marginalized and stigmatized elsewhere are vulnerable to homelessness.

In addition, homeless people are criminalized as temporary interventions. However this does not

address the problem of homelessness, since these imprisoned homeless people always go back to the streets after being detained for a brief period of time without housing or housing to return to. Such criminal convictions of minor offenses will subsequently act as a barrier that prevents the homeless from accessing jobs, housing, and public services, thus exacerbating the exit from homelessness. The constant cycling of the arrest of homeless people just to get them out to the street does not fix the homeless problem but instead uses the resources of the public to implement these measures instead of supplying homeless people with accommodation to keep them off the street (NLCHP 2014 cited in Opare 2018).

## Conclusion

Overall, it is concluded that there is a higher risk of homelessness in persons with disabilities than in the general population. Individuals with some types of disability (mental illness, leprosy, mobility deficiency, visual impairment, etc.) are more vulnerable to homelessness and may require additional housing assistance, which tends to be lacking in many low-income countries. In conclusion the author recognizes that while this entry highlights homelessness and its intersection with disability, it is worthy to note that discrimination in housing provision is often encountered by persons with disabilities, and the entry could have shed light on what provisions the CBR matrix makes for individuals with disabilities who are homelessness.

Education; Home education; Public policy

## Definition

Homeschooling, or home education, is the education and training of school-age children, between ages 5 and 17, occurring in a nonpublic or registered private school setting.

## Introduction: Brief Overview of Homeschooling in the USA

Although it as old as education itself, homeschooling, as a formal, institutionalized means of educating children, began in the late 1970s, with only a few thousand adherents. By 2012; however, latest estimates calculate over 1.7 million children homeschooled (National Center for Education Statistics 2013). According to the US Department of Education, children between ages 5 and 17 who were homeschooled increased 61.8% or equivalent to 3.4% of the total number of elementary- and secondary-aged school children. After battling early on for educational, cultural, and legal legitimacy, homeschooling, particularly with the assistance of organized legal lobbying groups, such as the Homeschool Legal Defense Association (HSLDA 2016), can no longer be considered a fringe element of public school alternatives (Cooper and Sureau 2007). Given its meteoric rise and staying power, it is now a fully institutionalized alternative to public school education and an important contributor to education choice specifically and social policy broadly.

Many questions abound regarding homeschooling as social policy: What are the primary motivations or reasons for homeschooling? Are homeschooled students adequately prepared socially and civically? Is there sufficient state regulatory oversight of various homeschooling activities, including curriculum choice, testing, student development, and the like? What is the future of homeschool education? This essay will address these questions.

## What Are the Primary Motivations or Reasons for Homeschooling?

Homeschooling, or home education, recognizes the education and training of school-age children in a private setting. Why do nearly two million children homeschool in the USA today? Three primary explanations for engaging in homeschooling are religious identification, ideological affirmation, and pursuit of higher levels of student academic achievement. Several secondary explanations include parent educators provide an

active and positive role model for children, help develop a strong sense of efficacy for assisting children in learning, and help to provide strong and positive perceptions of life, and for African-American parent educators, especially, it is to protect their children from overt forms and displays of racism that often occur in public schools. These motivations or reasons are discussed in more detail.

First, beginning in the 1970s, the initial interest in homeschool education arose from a dedicated and sincere constituency, who were generally politically and ideologically conservative, largely evangelical Christian, predominantly white, and primarily middle to upper middle class (Gaither 2009). Living mostly in rural communities and the expanding suburbia, this demographic core believed strongly in the biblical mandate (e.g., Deuteronomy 6:7; Proverbs 22:6; Ephesians 6:4) to educate, train, and discipline their children at home, away from what they considered the negative influence of the institutionalized school system. Supporting this position was the fear by many in the fledging homeschool movement that public education was not only a failed system but was antagonistic to their core beliefs: faith in God, traditional family values, and solid pedagogy (Kunzman and Gaither 2013). Bolstering homeschool families' beliefs and practices, organizations, such as the nonprofit legal advocacy group, Homeschool Legal Defense Association (HSLDA), established by Michael Farris in 1983, have provided legal support and advice to homeschool families. HSLDA has successfully defended the rights of homeschool families in all 50 states to practice home education, largely unimpeded from allegedly onerous state regulations.

Second, homeschooling practices and constituent groups are becoming more diversified. Initially concerned with the lack of adequate rigor in the basic areas of education – reading, writing, and math skills – home educators have broadened their approach to include a variety of educational and pedagogical models, such as classical, service, and apprenticeship. Homeschool networks and cooperative groups of homeschool educators, primarily "stay-at-home moms," exploded during the 1990s and 2000s. These venues provided the opportunity for replication of institutionalized educational settings, dividing according to age, subject matter, or both. Larger homeschool gatherings appeared, such as state conventions, where curriculum vendors marketed and sold their wares, and workshops provided hands-on training for what and how to teach specialized subject areas, such as math and science, and how to address the demands of special needs children. These conventions oftentimes met in state capitols or other large cities.

Third, in addition to the growing diversity of pedagogy and curriculum is the demographic and social diversity of homeschool participants. Although recent evidence suggests that close to 75% of the total homeschool population is white, a growing percentage of African-American and Hispanic-American families are drawn to homeschooling. Homeschooling is no longer the domain of a select white, middle- to upper-middle-class clientele. Homeschooling among African-American families has increased to about 8% of the approximately two million K-12 homeschooled children in the USA (Ray 2015). Recent research strongly suggests that segments of the African-American community have grown extremely frustrated with the inability of public school systems, especially those in large cities, to address the educational needs of African-American students. Sizable numbers of African-Americans surveyed strongly approve of inventive options within the public arena, including use of tax credits, vouchers for use at private or parochial schools, and public charter schools. More recent surveys indicate a slow, steady movement toward nonpublic education venues, including private and homeschool options. The real question is "Why are African-American families slowly gravitating toward homeschooling?"

Like most Caucasian home educators, African-American parents desire better learning achievement results, provide religious and moral instruction than is provided in public school settings, customize each child's educational needs, and many more. Unlike Caucasian homeschool parents, African-American home educators are motivated to homeschool for what is termed "racial

protectionism," i.e., "to protect their children from the ill effects of school-related racism" (Mazama and Lundy 2012). In addition, African-American families who homeschool often use the venue to use specialized curriculum that emphasizes the historical importance of Afrocentric contributions in a wide variety of fields and endeavors. And regardless of race or ethnicity, the public school and homeschool community interaction and cooperation has increased across the USA. Greater cooperation enhances not only working toward improving educational achievement levels but in dispelling myths that homeschool students do not engage or socialize at a rate equal to their public school counterparts (Dahlquist et al. 2006).

## Are Homeschooled Students Adequately Prepared Socially and Civically?

A major criticism of homeschooling is the alleged ill-preparedness of children socially and civically. The argument is largely centered on the lack of social interaction and community development by homeschool families' children. Fundamental to public education is the environment created by interaction within not only the classroom but in social activities and events that initiate and develop socially engaged individuals. Home-educated families vigorously deny these allegations, contending that through cooperatives, social events, community engagement opportunities, clubs, and athletic events and associations, homeschool families have ample opportunities for enhancing socialization (Kunzman and Gaither 2013, 19). The long-term effects of the socialization of homeschool are realized in a number of ways including generational transfer of the homeschooling ethos, successful completion of higher education, and higher levels of political and civic knowledge.

Social interaction and community building for the homeschool family, however, is not limited to developing sound playground etiquette with the neighbor next door, but it also revolves around the need to identify and develop religious values. As mentioned earlier, this is also an important explanation for why homeschool families home educate in the first place, but it also helps explain a critical component of their religious ideological development: fostering cultural and civic engagement according to these highly developed and protected religious-cultural values.

Engaging in religious-oriented cooperatives, for example, is one way to enhance homeschool families' ability to counter the cultural challenges to not only their faith but to corresponding cultural and civic outgrowths of their faith, such as ideological and philosophical opposition to controversial policy issues such as abortion, same-sex marriage, transgenderism, and legalization of drugs.

Homeschool children often have strong sense of courage of conviction and a greater motivation to be politically and civically engaged, primarily because they have a more highly developed value structure than their non-homeschooled peers. Although some are critical of homeschooling not for encouraging and developing a sound, civic, and constitutional awareness (Ross 2010), others complement homeschooling for promoting sound principles and values of citizenship, nationhood, and democratic values (Arai 1999). Additional empirical evidence is required, though, to determine the impact of sustained civic and social contribution of homeschooling to the greater public good. If early evidence is any indication, the prospects for the future are encouraging.

## Is There Sufficient State Regulatory Oversight of Homeschooling?

This third question is critical to our discussion of homeschooling as social policy. In large part because homeschooling is a departure, some would say a radical departure, from the institutionalized educational process, it should require greater governmental oversight. Ironically, though, this freedom from government regulation is a particularly important reason for pursuit of homeschooling. In this third section, the role and function of the Homeschool Legal Defense Association (HSLDA) in securing and protecting the legal right to homeschool is examined; voices and arguments for regulation of homeschool practice

are critiqued; and, lastly, general conclusions and implications for homeschooling are provided.

Homeschooling is no longer a fledging movement, but an institutionalized and highly successful example of teaching and training children in the confines of their homes. Homeschooling has a strong political and social base, both here (Cooper and Sureau 2007) and in other countries, such as Canada (Basham et al. 2007). The question becomes how effective is its legal standing. The short answer is very well; the long answer is a bit more complex.

To date the US Supreme Court has not weighed in on the constitutionality of homeschooling. Certainly First Amendment's free exercise clause claims have been made declaring the right of parents to withdraw their children from public schools (e.g., *Pierce v. Society of Sisters; Wisconsin v. Yoder*), whereas the Fourteenth Amendment's due process clause has long recognized the right of parents to raise their children (Gaither 2009; Kunzman and Gaither 2013). Still, even with the lack of constitutional declaration, homeschool advocacy organizations, such as the HSLDA, continue to pursue all legal avenues to remove state restrictions regarding parental pursuit of homeschooling.

The HSLDA, which was founded in 1983, aimed to defend and protect the legal, if not constitutional, right of parents to be the sole authority and overseer of their children's education. Over the last 30 years, the HSLDA has litigated, counseled, lobbied, and otherwise legally defended the right of homeschool parents to educate their children unhindered by state opposition. State resistance was strong in the beginning, but after several victories in the 1990s and early 2000s, HSLDA solidified their standing as the primary legal pro-homeschool defense organization, promoting their philosophical vision of the state, and public schools, as the enemy of freedom, rather than the promoter of the common good: which is described as the well-rounded education of society's children (Gaither 2009; Kunzman and Gaither 2013).

According to HSLDA, the US states are divided into four categories of regulation: "no regulation," "low regulation," "moderate regulation," and "high regulation." These regulatory categorizations, although broad and somewhat vague, reflect levels of state requirements for monitoring and regulating home education. These levels range from no notification to the state or local school district required on the part of the parent that they intend to homeschool to extensive oversight of homeschool families, including curriculum approval, teacher qualifications for parents, or even home visits by state education officials.

As of 2014 HSLDA reported 11 states have no regulation for parents to initiate contact with state or local officials their intention to homeschool (i.e., Alaska, Idaho, Texas, Oklahoma, Missouri, Iowa, Illinois, Indiana, Michigan, Connecticut, and New Jersey); 15 states only require parental notification, usually in writing (i.e., California, Nevada, Utah, Arizona, New Mexico, Kansas, Nebraska, Wyoming, Montana, Wisconsin, Kentucky, Mississippi, Alabama, Georgia, and Delaware); 19 states require parents to send written notification, submit test scores, and/or validate professional evaluation of student progress, particularly if the primary educator does not have a certified teacher license or a formal education (i.e., Washington, Oregon, Colorado, North Dakota, South Dakota, Minnesota, Arkansas, Louisiana, Tennessee, Florida, North Carolina, South Carolina, Virginia, West Virginia, Ohio, Washington DC, Maryland, New Hampshire, and Maine); and 5 states require all of the preceding requirements and require an in-home visit by a state education official (i.e., Pennsylvania, New York, Vermont, Rhode Island, and Massachusetts).

Since 2011, HSLDA has successfully fended off attempts by various states to further restrict the opportunity of parents to homeschool. This ranged from New Jersey, Pennsylvania, Michigan, and Ohio's failed attempts to pass legal protections for "at risk children," effectively requiring parents to seek and gain approval from the state before homeschooling children that the state deemed as "at risk," such as abused or neglected, to Iowa's attempt to restore state oversight regarding notification and assessment requirements (www.hslda.org/laws). Too often HSLDA is viewed as critical of any type of contact, positive or otherwise, with states and local

school districts. However, this is simply not true. As of 2016, for example, one important regulatory area that is embraced by both HSLDA and most states (e.g., 43 as of April 2016) is the participation of homeschool students in public school organizations, clubs, and activities, such as band, chorale, and sports. These joint partnerships between homeschool families, cooperatives, and other homeschool organizations and public schools are indicative of (a) the intentionality of both homeschool advocates and public school organizations and officials to initiate meaningful community and (b) the continuation of both parties to meet common ground, whether it is culturally or academically.

Still, there are important arguments to consider, both philosophical and policy oriented, which argue against lifting all forms of regulatory oversight of homeschooling. One of the primary voices is Rob Reich, a professor of political science, Stanford University. Reich makes compelling philosophical and policy arguments in favor of a tripartite responsibility for a child's education: the child, the parent, and the state (Reich 2008).

First, Reich argues there is a threefold relationship between philosophy and public policy: (1) political theory provides for element of policy prescription; (2) political theory limits range of "permissible policies" in a liberal democratic state; and (3) political theory generates values that "structure the democratic process," which ultimately leads to implementation of public policy (2008, 19). Some form of state regulation of homeschooling is appropriate when it is defending and promoting, for example, the rights of parents to homeschool, the "independent voice of the child" (i.e., what are her interests, particularly the older the child is) not to be homeschooled, and the authority and responsibility of the state to ensure that the right of education is guaranteed for all, thus advancing the common good. Thus, for Reich it is inappropriate from a liberal democratic position to permit little to no regulation of homeschooling, assuming that the parents' interests are solely for the defense, safety, and security of their child and not for the betterment of society, for which education is a critical element.

Second, Reich disagrees with the analogy between the state's regulatory position over education and parental authority over their children's welfare. Some critics, such as Perry Glanzer, contend that Reich (1) "places an unjustified burden on the parents to show adequacy of homeschooling arrangements" and (2) that he "...underestimates the state's tendency to use regulation to weaken the civil society essential for liberal democracy" (Glanzer 2008, 1). Reich disagrees. It is not that the state trumps or supersedes parental authority and oversight of the child's welfare, but when it comes to education, which has a compelling civic and social impact and outcome, the state's authority is different. The state's authority and thus regulatory oversight is necessary because for Reich, unlike homeschool parents, education is a privilege, not a right.

Others, such as Robert Kunzman (2009), seek a balanced regulatory framework: one "...that strives to balance principle and practicality, and that seeks to accommodate diverse beliefs about the purposes of education while protecting the basic interests of children..." (323). For this balance to work, three conditions are required from formulating to implementing homeschool regulatory policy: (1) recognize that vital interests of the children are at stake; (2) general consensus is necessary for defining and meeting these "vital interests"; and (3) there must be "effective ways to measure the criteria" (324). This would be extremely difficult, if not impossible; however, in the US' federal system of governance. To date most education policy is conducted at the state level, and so to bring about the conditions Kunzman iterates would require substantial cooperation between all three levels of government. Based on recent history regarding disjointed governmental cooperation of educational policy, i.e., *No Child Left Behind*, future prospects do not look good.

## Conclusion

Homeschooling, dormant in the USA from the early 1920s through the 1960s, reemerged in the 1970s, primarily as both an ideological and pedagogical alternative to the traditional

institutionalized public school system. In addition, homeschooling parents, who in the beginning were largely Caucasian, conservative, and Christian, embraced homeschooling as a critical opportunity to protect and care for their children's well-being, something the vast majority did not believe the public school system did.

Today, homeschooling is more diverse, embracing families from various racial and ethnic backgrounds, including African and Hispanic-Americans, while at the same time broadening its appeal geographically, ranging from rural Southern states to urban and suburban New England states. Homeschooling has staunch advocates in all 50 states, especially state legislative assemblies and governors' offices. State legislation is being passed in almost all 50 states that enhance the appeal of homeschooling, including lessening requirements for parental certification of teaching merit to promoting partnerships and innovative relationships between homeschool parents, cooperatives, and other organizations and the public school systems. These partnerships bridge the divide once found in sports, arts, and music and other organizational opportunities where homeschool students can now interact with their public school peers.

Legal advocacy organizations, such as Homeschool Legal Defense Association (HSLDA), defend the privilege (and/or right) of parents to homeschool. With membership nearing the 100,000 mark, and a long list of successful court cases that protect the right of homeschool families and students to pursue homeschooling as a legitimate public school alternative in its wake, HSLDA continues to pressure state governments not to pass laws and regulations that inhibit this right.

By 2000, the first Christian liberal arts university, which primarily targeted toward homeschool students, opened. Today, 16 years later, Patrick Henry College (PHC) boasts an enrollment nearing 500 full-time residential students, with numerous programs and majors. Situated in Loudon Country, only 50 miles from downtown DC, PHC boasts several majors, such as prelaw, government, public policy, strategic intelligence, and political journalism, whose students intern, study, and research in governmental and political agencies and organizations, demonstrating their academic and vocational strengths and acumen.

Homeschooling is a vital and contributing element in today's social and educational policy milieu. It will continue to grow and strengthen as public perception of the US public school system continues to deteriorate. Regulatory oversight will continue to be a contentious subject. Balance between extreme oversight and complete laxity of the state toward homeschooling is critical. Some type of middle-ground approach is necessary, one that balances the rights and privileges of the homeschool family and child with the state's responsibility to pursue the common good for all of its citizens.

## Horizontal Accountability to Prevent Corruption

Nurul Huda Sakib
Department of Government and Politics, Jahangirnagar University, Dhaka, Bangladesh

### Synonyms

Outwards accountability; Parallel accountability; Uniform accountability

### Defining Horizontal Accountability

Horizontal accountability contrast with traditional vertical accountability system where *the accountee is not hierarchically superior to the accounter* (Schillemans 2011). It may alternatively be understood as a form of accountability to third parties. For semiautonomous agencies, independent evaluators, boards of stakeholders or commissioners, journalists, interest groups, and clients can all act as horizontal accountees. In other words, remain accountable to similar status authority. The word "outwards" is key to understand the notion because it infers the accountability of two or more separate, independent authority, where both is under surveillance by each authority (Mulgan 2003). For example, the performance of the election commission accountability can be monitored by judiciary or parliament.

### From Vertical to Horizontal Accountability

Accountability often regarded as "buzzword of the modern era" because of unclear meaning and diversity of the terminology (Mulgan 2003). In simplest term, accountability is a method of keeping citizens informed and authority in check doing misconduct (Aldons 2001). In political science words like transparency, equity, democracy, efficiency, responsiveness, responsibility, integrity, and so on are simultaneously used as synonyms to accountability (Schillemans 2011). There are two ways accountability works: vertical and horizontal accountability (Fig. 1). Vertical accountability denotes a more traditional form of meaning where someone at upper position demands accountability to his subordinates. It is a kind of principal-agent relationship where the principal always asks for the answer to his agents. For example, in a democratic system people (principle) elect a political party (agent) to govern for a period. If they are not satisfied with the government, they withdraw them from power either by the ballot box or demanding resignation or punishment (Head et al. 2016). However, these conventional vertical mechanisms have been criticized by many for limited success holding officials less accountable. The problem is lying within the agency (party in power) as they abuse power, involved in wrongdoing.

Pope (2000) argued that the trajectory of vertical accountability itself proved too inadequate throughout history. There is always a big difference between the party in power and remaining in opposition. In most cases, especially in developing countries, political parties came to power with a lot of promises. But on many occasions, they failed to keep those promises and fear of losing the election. Therefore, they create a system of patronage to reelect. Within the system, they misappropriated or stole public funds. Bureaucratic class (who remain isolated from the public) on the other hand routinely demand bribes and create a nexus with the political and business class. They together control public contracts and public posts, involved in unfair recruitment. Even in some countries, despite political pressing effective reforms does not sustain due to rigid bureaucratic practice. Therefore, public services may be poorly delivered (Pope 2000).

Limitations of holding public officials accountable in "vertical accountability" form pioneered by O'Donnell (1998) who argued that any

**Horizontal Accountability to Prevent Corruption, Fig. 1** Vertical and horizontal lines of accountability. (Source: Schillemans 2011, p. 391)

unlawful activities by any state agencies or agent can be routinely oversight by other state agencies. Therefore, these agencies need to be legally enabled and empowered. His concept can be traced down the as effective separation of power; where "the diverse agencies of government would be unable to defend their autonomy against encroachment" (Kenney 2003, p. 5). Although O'Donnell broadly focuses on the scope of the horizontal accountability to state agencies. Nowadays, non-state actors like media, trade union, political party, business peak associations, mass social movements, and so on are also a crucial part of horizontal accountability. According to Schmitter (1999, p. 60) who portrays the importance of non-state actors in horizontal accountability that "not only denounce the infractions of officials but even bring appropriate sanctions to bear on them."

## National Integrity Systems as Horizontal Accountability Model to Prevent Corruption

The notion of horizontal accountability in contemporary time acknowledges by many researchers and practitioners. Their main attempt is to ensure good governance in a democratic system. The National Integrity Systems (NIS) is one of such models that was developed in the 1990s by Jeremy Pope, who as the co-founder of Transparency International (TI) introduced it as a system of "horizontal accountability." Thus, Pope favored "horizontal accountability" and introduced the NIS to elaborate on this concept. Under the system of "horizontal accountability," the organs of the government and indicators of governance are the key indicators that Pope called "pillars." The NIS is different from conventional vertical accountability systems because each pillar is interlocking with each other in a "virtuous circle." Each "pillar" is "both watcher and is watched, is both a monitor and is monitored" (Pope 2000) (Fig. 2). Pope's NIS framework may best be described by the following diagram, which is commonly called the "Greek Temple."

The NIS framework adapted from Pope indicates that all the institutions side by side is accountable to each other in a certain way. For example, the role of the watchdog agencies is to focus on corruption in all the sectors. The role of civil society or media, on the other hand, is to criticize those efforts if they are not doing their jobs. Similarly, the judiciary or legislature controls civil society or media so that they might not be biased. The temple rests on foundations comprises of public awareness and social values. At the roof, there are three balls – sustainable development, the rule of law, and quality of life –

**Horizontal Accountability to Prevent Corruption, Fig. 2** Institutional pillars of the NIS framework "Greek Temple." (Source: Pope 2000, p. 35)

indicating that all the pillars should remain level with each other so that these balls can stay static (Head et al. 2016; Pope 2000). The pillars of the framework may differ from culture to culture. However, the common integrity pillars that have been present in most of the countries and they follow particular "rules and practices," which suggest their strength and weakness (Table 1).

The main goal of implementing the NIS framework is to make corrupt practices "high risk" rather than "low risk." It is not likely that all the pillars may function all the time properly. However, maintaining checks and balance through this integrity framework corruption may be reduced. Recently TI has attempted a holistic diagnosis of the anti-corruption system in a country focusing three indicators for each pillar: "(1) their overall capacity, (2) their internal governance systems and procedures, and (3) their role in the overall integrity system" (Brown and Heinrich 2017). TI now assesses over 100 countries using NIS assessment tools and provides key reform suggestions based on the results of its assessments.

The NIS approach has been criticized by scholars and practitioners. Heywood and Johnson (2017) identified several problems: (1) the institutional approach underpinning the NIS methodology is too narrow; (2) the NIS does not focus on cultural distinctiveness; (3) it has an incorrect conceptualization and articulation of "integrity," and (4) it has an overemphasis on compliance-based approaches to combating corruption at the expense of the positive promotion of integrity. They argued that a more effective NIS needed greater recognition of specific cultural challenges and national legacies with effective reforms. These recent criticisms extended earlier critiques. One of the biggest criticisms of the NIS has been that it is more normative than practical. The NIS depends on multiple institutions and laws in balance to achieve integrity, which is difficult to achieve and assess in the real world (Head et al.

**Horizontal Accountability to Prevent Corruption, Table 1** Common NIS pillars and their "rules and practices"

| Institutional pillars | Corresponding core rules/ practices |
|---|---|
| Executive | Conflict of interest rules |
| Parliament | Fair elections |
| Public Accounts Committee (of the legislature) | Power to questions senior officials |
| Auditor general | Public reporting |
| Public service | Public service ethics |
| Judiciary | Independence |
| Media | Access to information |
| Civil society | Freedom of speech and assembly |
| Ombudsman | Records management |
| Anti-corruption/ watchdog agencies | Enforceable and enforced laws |
| Private sector | Competition policy, including public procurement rules |
| International community | Effective mutual legal/ judicial assistance |

Source: Head et al. (2016, p. 27)

2016). Another criticism of NIS concerns its applicability outside developed democratic countries (Brown and Heinrich 2017). Applying the NIS to Lithuania, for example, Doig (2006) argued that translating the general NIS model into practice was extremely difficult and required considerable local expertise and adaptation.

Sampford, Smith, and Brown (2005, p. 98) are comfortable to mention the process as "mutual accountability" because horizontal accountability rarely visible among integrity agencies because "an equality of legal and/or political power between institutions that is typically absent. 'Mutuality' also allows for aspects of accountability based less on formal powers and assessments and more on subtle watching and advising." They focused on another model of promoting integrity they called the "bird's nest." Criticizing the NIS, they argued that integrity does not break down or become weak as a failure of a single pillar. Because all the government institutions or agencies in the integrity system are like interlocking twigs in a nest-like structure, the weakness of one twig may not have a significant impact (Sampford et al. 2005).

However, Doig and McIvor (2003) showed that the NIS approach could work in practice in their research on 18 countries around the world. They thought that the NIS approach was very important because it offered an effective qualitative approach to measure the pillars regularly and provided an assessment of the weakness and strengths of the different pillars. The advantage of such a systematic, cohesive, and coherent NIS framework is to help donors and countries to develop a national plan (Head et al. 2016). Similarly, Hubert's evaluation of seven world cities suggests that the main integrity pillars of Pope's model were present in all of them and that the institutions in those cities are maintaining a balance between them to promoting integrity (Huberts et al. 2008). These results suggest the importance of all the pillars to combat corruption and suggest that there is a need for mutual reinforming to combat corruption from all its pillars.

## Can Horizontal Accountability Be Effective in Developing Countries to Prevent Corruption?

Depicting the NIS model of horizontal accountability and the concept of horizontal accountability itself raised the ultimate question of effectiveness to ensure good governance and reduce corruption in developing countries. It is a difficult task for countries with low Corruption Perception Index (CPI) and fragile governance to ensure as O'Donnell (1998) argued that the state agencies should have "the capacity, autonomy and willingness to control, redress and/or sanction actions or omissions of other state agencies that are unlawful" (Ankamah 2016, p. 291). In developing countries, these practices are myth rather than reality. Because corrupt syndicate in developing countries create a nexus with the entire system and issues like autonomy, sanction and so on hardly visible.

In general, there are funding limitations to enforce capacity and sanction (Ackerman 2004).

Therefore, supporting Kenney (2003) statement (Ankamah 2016, p. 291) also agrees that "accountability without the capacity to sanction where public officials are found to have committed misconduct is indeed a diminished form of accountability." Also, Schillemans (2011) contended that accountability practice is more important than accountability mechanism because in many countries public agencies are not obliged to provide accounts in front of interest groups or mass media. Therefore, NIS model of horizontal accountability discussed here largely to be failed in developing countries due to lack of accountability practice. Many developing countries already have an accountability mechanism to hold public officials accountable. But they do not have the practice to deliver such an accountability framework. There are many issues, e.g., biased media and civil society, the threat of killing, and so on.

Another serious problem in developing countries is the institutional weakness within the integrity pillars. Drawing developing countries example while investigating Bangladesh's national integrity strategy pillar assessment Sakib (2018) found that pillars, like local government, election commission, anti-corruption commission, executives, judiciary, parliament and political parties, are in a fragile condition due to corruption within the pillars, coordination problem, skills, political will, and so on. There are many incidents in Bangladesh the ACC faced coordination problem with auditor office. Thus, countries like Bangladesh and other developing countries must maintain horizontal accountability while most of the integrity agencies lack integrity. Therefore, O'Donnell's (1998, p. 123) recommendations ensuring "highly professionalized, adequately and independently endowed with resources, and insulated from political interference" is unlikely in developing countries.

## Conclusion

Horizontal accountability might fit in developed countries context as Western counties have better governance, democratic practice, rule of law, separation of power, and effective sanctions. However, in developing countries, these facts remain paper only. Therefore, the underline fact of horizontal accountably suggests that it is difficult to maintain horizontal accountability unless both vertical electoral (core pillars) horizontal mechanism both make "fire alarm." Therefore, the active involvement of civil society and the media is critical. Also, there is the urgency of social accountability which might work side by side with horizontal accentuality Ankamah (2016). The rise of social networking now become a tool to make the relationship between horizontal and social accountability, where active citizens can easily draw the attention of media, civil society and the government to ensure good governance.

## Synonyms

Advanced directives; End-of-life care decisions; Health disparities; Hospice

## Definition

Making end-of-life care decisions in advance is intended to improve the quality of life for patients during their final months or days before death. It also helps to assure that a person's care wishes are adhered to as well as reduce the cost of high technology and medical services. The accumulative research has shown that African-Americans are less likely to make these decisions in advance than white Americans. Factors contributing to this difference include religious or cultural considerations, lack of awareness, differences in the availability of health care, and a lack of trust in a white-dominated medical system.

The literature is replete with evidence identifying significant disparities between African-Americans and whites in using end-of-life planning mechanisms. This assessment extends across a broad spectrum of end-of-life care planning. Examples cover a continuum of both legal and personal health-care mechanisms to help a dying person "settle their affairs": advance directives, medical power of attorney, palliative care, hospice care, euthanasia (in the state of Oregon), various public policies designed to give the dying person a "Bill of Rights," and others.

## Introduction

Dying is one of the few events in life that is certain to occur, but for which we rarely plan. End-of-life care planning involves a process of communication between an individual, his or her family members, and health-care providers to ensure that care is consistent with the individual's treatment preferences and values. This planning process typically results in written instructions, including advanced directives, wills, or other legal procedures to be executed by a competent individual in the event the person becomes incapacitated. It also includes services such as palliative care, hospice, euthanasia, and others. At the societal level, public policies have been instituted to enhance individual decision-making, such as the dying person's "Bill of Rights." Although individuals usually have ample opportunity to express their wishes before death, these wishes are left unspoken for 70% of Americans (Hilliard et al. 2013).

For individuals who engage in a meaningful discussion about the dying process, it quickly highlights how death typically occurs in a modern

society and the choices for how end-of-life care is provided. Over the last seven decades, there has been a shift from the typical death being located at home to a hospital. In the 1940s, most Americans still died at home. In 1949, only 40% of persons older than 65 years of age died in the hospital. But over the next several decades, as the hospital increasingly monopolized acute care delivery and its reputation for curative care soared, the trend toward hospital death accelerated. By the 1970s and early 1980s, more than half of US deaths occurred in hospitals, and the proportion occurring at home dropped to 15% (Rothman 2014). Moreover, given the success of modern medicine and treatments, the cause of death is now most often the culmination of years with chronic illness, such as dementia, congestive heart failure, or cancer. Most people dying from these causes often suffer debilitating symptoms, delirium, or severe pain in the process.

This shift in how and where we die has caused increasing concern about the traditional medical "problem-cure" model of providing care. This model often falls short of following consumer perceptions of quality and personal preferences in end-of-life care. As a result, concerns have been raised reflecting notions of "good" and "bad" deaths which are threaded throughout discussions about dying and death. These two concepts are not fixed in meaning but rather are shaped by people's experience, spiritual beliefs, culture, social mores, technology, and available options for dying. According to the US Institute of Medicine, a good death is characterized by "one that is free from avoidable distress and suffering for patients, families, and caregivers. In general, services are provided in accord with patients' and families' wishes, and are reasonably consistent with clinical, cultural, and ethical standards. Conversely, a bad death is characterized by needless suffering, lack of sensitivity for patient or family wishes or values. Fundamentally, it involves a sense among participants or observers that norms of decency have been offended" (Institute of Medicine 1997, p. 4).

Promoting earlier end-of-life care planning and decision-making has become an important societal goal in all modern nations. Making a decision to forgo or to sustain life with artificial treatment is a complex process that brings various individual, economic, educational, social, and cultural traits into play. While the preponderance of studies indicates that it would be improper to consider cultural, religious, and demographic elements as predictors of behavior, they do hold them as critical to having a full understanding of their influence in decision-making at life's end. Studies that focus on racial/ethnic differences in end-of-life care planning are significant because who we are and our perception of a "good death" are the products of generations of core religious beliefs, culture, and a variety of socioeconomic factors. These broad contextual influences have a significant impact upon an individual's end-of life care decision-making.

## Alternative Explanations for Differences in End-of-Life Planning

Studies involving culturally diverse patient's responses to end-of-life care planning began to appear in the 1990s. They have consistently demonstrated that there are significant disparities in planning and how and where we die among population groups. These differences persist despite extensive efforts to provide information and greater access to end-of-life planning options. Some insights on why these differences persist are revealed in a 2013 PEW Research Center survey. This survey demonstrated that African-Americans differed from non-Hispanic whites in their willingness to complete advance directives and their desires about life-sustaining treatment. Both earlier and recent studies have found that significantly more African-Americans and Hispanics want their doctors to keep them alive regardless of how ill they are, while more whites agreed to stop life-prolonging treatment under some circumstances. These survey results suggest that a common notion of a good death that could provide structure for end-of-life care is lacking, particularly for African-Americans. Invariably, we are lacking a comprehensive understanding about how the concept of a good death might

vary across relevant populations or different cultures (Wicher and Meeker 2012).

### Demographic Differences

There is a preponderance of scholarship documenting the extent of health disparities in the USA and the contributing demographic factors. Differences in end-of-life care decisions are well documented in income, education, environmental and economic conditions, health behaviors, lifestyle patterns, access to care, as well as differences in the levels of quality care received. Disparities have also been observed by geographic location, age, gender, and disability status (Atrash and Hunter 2006). A common linking thread behind these disparities is that US minority groups experience poorer access to medical care and services than their white counterparts. For example, even after adjusting for socioeconomic status and access-related indicators, African-Americans are less likely than whites to have primary care providers. Although previous research has shown that these factors create real barriers to care and services, they do not tell the whole story (Welch et al. 2005). These studies offer descriptive explanations which are useful but fail to provide insights for the underlying causes. In many instances, we are left with suppositions about religious, cultural, and socioeconomic differences.

### Consumer Education Explanations

The literature indicates that there are historical and present-day challenges in consumer education that limit the effectiveness of various initiatives in reaching all population groups equally. There is considerable anecdotal evidence supporting the conclusion that working-class people, who constitute the majority of African-Americans, feel more uncomfortable and less prepared in dealing with middle- and upper-status professionals than they do in dealing with persons of equal status. Moreover, poor people, as a class, frequently mistrust traditional bureaucratic institutions that have "mistreated" them or lack confidence in their ability to communicate their concerns and problems in terms understood by doctors (Smith and Jennings 1997).

To illustrate this consumer education challenge, in May 2006, Caring Connections, of the **National Hospice and Palliative Care Organization** (NHPCO), conducted two African-American end-of-life focus groups in St. Louis, Missouri. Group participants discussed their general feelings and issues regarding end-of-life thinking and planning. Most participants were unaware of the true meaning of advance planning, using it interchangeably with end-of-life care, which they connected with life insurance and funeral planning. Many misinterpreted the materials they were given and thought that advance medical care planning referred to an agency or organization where all advance directives are stored. It was noted that there was significant distrust in the focus groups that even if preferences are specified in writing, the medical professional in charge would not honor them (African American Outreach Guide 2008).

### Mistrust Explanations

A number of studies highlight explanations of prior discrimination or abuse to explain differences in end-of-life care planning. Many African-Americans remember the days of segregation, Jim Crow laws, and violence toward their people. And many African-Americans are deeply distrustful of the government and the health-care system, a distrust that is rooted in both historical and present-day experiences. For example, the Tuskegee syphilis experiment was an infamous clinical study conducted between 1932 and 1972 by the US Public Health Service to study the natural progression of untreated syphilis in rural African-American men in Alabama. They were told that they were receiving free health care from the US government while purposely left untreated. Similarly, there is the case of Henrietta Lacks (August 1, 1920–October 4, 1951), an African-American woman who was the unwitting source of cells from her cancerous tumor which were cultured to create the first known human immortal cell line for medical research. This is now known as the HeLa cell line.

### Explanations of Religion and Cultural Beliefs

A number of studies indicate that religious beliefs have a significant influence on African-American decisions and practices during the end

of life. In some cases, African-Americans perceive advance directives and palliative care measures as "giving up hope" or not respecting their religious or personal values. For example, African-American elders are more likely than whites to believe that God is the ultimate decision-maker regarding the time, manner, and place of death and are also more likely to have religious prohibitions against limiting life-sustaining treatment.

The preponderance of literature suggests that the role of the church in the broader African-American community has the potential to yield insights into the personal preferences about end-of-life treatments. For example, most white mainline Protestants (72%), white Catholics (65%), and white evangelical Protestants (62%) say they would stop their medical treatment if they had an incurable disease and were suffering a great deal of pain (PEW 2013). By contrast, most African-American Protestants (61%) and 57% of Hispanic Catholics say they would tell their doctors to do everything possible to save their lives in the same circumstances (PEW 2013). On balance, African-Americans and Hispanics are less likely than whites to say they would halt medical treatment if they faced these kinds of situations.

## Conclusion

After thousands of years of pondering it, we still consider death, and the process of dying, to be among life's most perplexing mysteries. What we know, however, is that death and dying is not a purely individual act, any more than life is (Aries 2015, p. 41). An individual's experiences while dying are differently shaped by the nature of their illness, by individuals, by family, and by others' reactions to it. It is also affected by the quality of care provided for their physical, psychological, spiritual, and practical needs.

This examination of the current state of knowledge suggests that end-of-life care decision-making is multidimensional, and any attempt to explain disparities must approach it from multiple perspectives. In doing so, we can better assemble the mosaic of the population being served. This is a "picture" where the population's needs, wants, deficiencies, and cultural diversities are pieced together in an interlocking way. This presents significant challenges in developing more effective public policies and programs. The essential steps in making this a productive process first require that scholars use mixed research methodologies to examine the impact of religious behaviors and other social-cultural factors on end-of-life care decision-making by African-Americans. Both qualitative and quantitative techniques should be employed for collecting and analyzing information.

Second, though initiatives have been implemented in some areas, more culturally sensitive education is needed to increase awareness of end-of-life care services and its benefits. Some studies suggest that cultural diversity among hospice staff may influence the level of diversity among the agency's patients (Rhodes 2006). As we become an increasingly diverse society, we need to bolster current educational efforts to improve cultural competence among health-care providers. Overcoming the health disparity gap will require better patient education, better tools for patient engagement, and increased provider awareness of population-specific barriers to care. Providers will need to improve the skills required to care for patients from dissimilar backgrounds and languages. Admittedly, the effectiveness of cultural competence training remains to be fully tested, but its potential benefits should not remain unexplored (Peterson and Yancy 2009). Ann C. Klassen and her colleagues captured it well when they conclude that ". . .. Caregivers cannot undo a patient's past experiences, but they can be aware of the influence of those experiences on current decisions and well-being" (Klassen et al. 2002).

Third, the literature shows that many public and private efforts frequently focus on persuading people to change their behaviors and perceptions of end-of-life care to make it more "logical." This approach fails to challenge the medical and social structures and place primary responsibility on individual choices. This is particularly so with African-Americans who have encountered discrimination (both overt and covert), mistreatment,

and suffered inequalities. These have been powerful and frequently systematic experiences that have been woven into cultural experiences and are not easily dispensed. Moreover, given the powerful influence of our environment, people cannot be expected to change patterns of decision-making through individual behavior alone. Rather, any solution that public policy officials test must also consider changing community environmental situations (Lavery et al. 2005).

Finally, the research spectrum needs to be broadened. Health-care professionals are not the sole providers of care. Family members also often provide elder care. Most frail adults who need help with basic activities live in the community, not in nursing homes, and receive care from family members, not from paid helpers. Older adults with disabilities who receive family care are substantially less likely to become institutionalized. African-Americans, those in excellent or very good health and those with frail spouses or parents, are especially likely to engage in caregiving activities. Nearly seven in eight adults age 55 and older with frail parents serve as family caregivers.

# Housing Policies in South Korea

Yoonseuk Woo
Department of Public Administration, Soongsil University, Seoul, South Korea

## Introduction

Although traditional hierarchical government intervention has often faced criticism, particularly from the entrepreneurial viewpoint (Osborne and Gaebler 1992), the housing sector is usually regarded as a realm in which government intervention is appropriate due to its unique feature as value goods and its role in social welfare delivery

(Woo 2013). According to Kemeny (1981), different government intervention approaches lead to either a dual or unitary housing rental market structure. In a dual rental market, the social rental sector is separated from the private rental sector by the residual approach of liberal and laissez-faire-type government intervention, while the social and private rental sector are not separated in a unitary rental market in which a wide range of government intervention is taken for granted.

South Korea has overseen the successful evolution of its modern housing supply from scratch since the Korean Civil War in 1950–1953, which has been achieved by alternately taking dual and unitary market approaches with each government regime with different political ideologies pursuing different housing policy. In South Korea, as the housing shortage problem arising from extremely rapid urbanization and industrialization has been the main target to be addressed by past governments, each government has tried its best to develop various policy tools to cope with ever-increasing housing demands through supplying more housing units and controlling housing price. Thus, one of the best expressions to refer to Korean housing policy is "a fool in the shower room," as noted by Noble laureate economist Milton Friedman, as each past government has adjusted the shower tab so frequently toward the right (deregulation) or left (tough regulation) that the housing market has become alternately hot and cold following these shifts. It is of interest to analyze the evolution in housing policy in South Korea as it could be an example of a successful strategy of housing supply for developing countries suffering from over-demand and housing shortage problems.

The aim of this article is to describe the evolution in South Korean housing policies to provide a relevant example and implication as a form of government-led housing supply in developing countries rather than just analyzing their impacts. In the following section, we briefly discuss the evolution of Korean housing policy since the 1960s in terms of policy orientation and various tools. The analysis is focused on housing shortages and prices, while less attention is given to levels of inequality in the housing market by location or income. While this is a key issue in modern society, it has only recently been highlighted as a main policy agenda, and increasing the housing supply and controlling housing prices are still the main interests of the incumbent regime in South Korea (The main agenda of the housing policy of the incumbent government is stated as "Respond to market conditions in a pre-emptive and flexible manner; rein in speculative demand in overheated areas while managing supply to an appropriate level in contracted areas; ultimately restore the housing market order geared toward real demand"; see http://www.molit.go.kr/USR/WPGE0201/m_35313/DTL.jsp).

## Evolution of Korean Housing Policy

### Policy Tools for Housing Policy in Korea

As discussed above, the Korean government has developed and implemented various kinds of policy tools to stimulate or stabilize the housing market. Typical policy tools and categories are listed in Table 1, which shows that some measures are even contradictory, such as tax increases and tax cuts, for example. Historic changes in Korean housing policy are to be summarized as a mix of applying these tools with different sets according to the ideological agenda of each past government (Kim 2013; Lee 2017; MoLTMA 2012; OECD 2018; Woo 2009).

### Beginning of Housing Policy: Regulation for Economic Development (1962–1979)

The initial housing policy in facto was tackled by President Park Chung-hee administration (1962–1979) beginning in 1962, when the first 5-year national economic development plan was launched. National development projects including highway building and industrial zone development driven by the government led to rapid urbanization and an influx of urban populations from rural areas, and the land prices for urban, residential, and industrial development skyrocketed throughout the entire country. High increases in population growth in urban areas led to an increase of urban slums and set off an ever-increasing over-demand for housing, which resulted in a high increase in

**Housing Policies in South Korea, Table 1** Housing policy categories and measures

| | | | |
|---|---|---|---|
| Speculation control (to suppress overheated housing market) | Demand control (to curb over-demand for housing) | Transaction control | Reporting housing transaction (to identify real buyers and methods of payment for imposing tax)<br>Designating speculation control zone (to control housing price in booming areas by regulating loans and transactions or rebuilding)<br>Apartment subscription qualification (to impose higher qualifications to buy a new apartment)<br>Apartment ownership trade control (to restrict chances to get speculative revenue by selling a right to buy a new apartment) |
| | | Tax increase | Readjusting tax base of real estate (to set tax rate according to real price)<br>Introducing new tax for real estate owners (to impose higher tax for plural housing owners) |
| | Public concept of land and real estate (not to exploit common goods for private interest) | | Restitution of development gains (to impose tax to whom get extra revenue by development)<br>Bond bidding system to buy a new apartment (to give more restriction to buy a new apartment by imposing duty to buy government bond without interest) |
| | Registration (to impose a duty to report data to government) | | Duty of registering real transaction price (to identify real price) |
| | Others | | Real estate agency management (to regulate real agent agencies who seek speculative revenue by introducing buyers and sellers for illegal transaction)<br>Tax investigation (to impose taxes on hidden transaction) |
| Economic stimulus (to make use of construction policy to stimulate economy) | Supporting affordability (to give more chances to buy housing) | Transaction vitalization | Relaxing regulation on subscription (to relieve qualification control to buy a new apartment)<br>Relaxing regulation on resale of purchase right (to give more chance to sell one's right to buy a new apartment) |
| | | Financial support | Loan for purchase and rent (to allocate extra loans to buyers and tenants) |
| | | Tax cut | Exemption and reduction of tax on real estate transaction (to relieve burden by adjusting tax rates) |
| | Increasing supply (to build more housing) | Deregulation | Relaxing regulation on housing supply (to remove building regulations on housing builders) |
| | | New development | New town development (to supply mega-sized housing units by developing new towns) |
| Social housing (to supply public rental housing) | Financial support (to loan public fund for tenants to pay the rent) | | Loan for rent deposit (to allocate public housing funds to tenants)<br>Interest discount of loan (to decrease interest rate of public housing fund) |
| | Increasing more public rental housing (to support to build more social housing) | | Supplying more social housing development sites (to develop housing sites by public housing corporation)<br>Supplying public housing fund for social housing builders (to loan public fund to private housing company to build social housing) |

Source: Kim and Lee (2005: 13)

housing prices. In order to cope with these problems, the government modified or enacted various laws and regulations dealing with urban planning, land expropriation, public housing, construction, or readjusting the division of land, and these actions contributed to supplying more housing units through apartment building and redeveloping unauthorized housing scatters. They also established the Korea Housing Corporation and Korea Housing Fund to support housing programs.

### Military Regimes: Widening Government Intervention (1980–1992)

From 1980 to 1992, the military regime led by President Chun Du-hwan and his successor President Roh Tae-woo initiated a massive increase in housing supply through new town development to cope with the ever-increasing overdemand for housing and the rapidly increasing housing prices. In 1980, President Chun announced a plan to supply five million housing units from 1981 to 1991. After several amendments to the plan, it was practically abandoned, but was still sufficient to provoke countrywide speculative private investment on real estate, with a massive trade surplus and monetary inflation due to a rate of annual economic growth over 12% in the late 1980s. The increasing annual rate of land price in 1989 hit 32%, while the rate between 1980 and 1987 was only 10.5%, and thus land prices throughout the whole country doubled during the last 3 years of the 1980s. It produced 35 trillion won (29 billion US$) of capital gains from land price increase, which accounted for 36% of the whole GDP in 1987 (MoLTMA 2013). President Roh announced a war against speculative investment on real estate and introduced a speculative investment prevention zone, higher tax burden for the benefit of price gap, concept of public ownership of land, and so forth. The administration also announced another massive supply plan of two million housing units (1988–1992) in 1988 through the development of five new towns around Seoul. In 1991, the housing supply hit 2,140 thousand units, and the implementation of the plan was so successful that it was ended 1 year earlier than originally scheduled.

### Democratized Regimes: Deregulation to Cope with Crisis (1993–2002)

After a long period of military regime, the first and second civilian governments were led by President Kim Young-sam and President Kim Dae-jung, respectively, from 1993 to 2002. In the early stages of the Kim Young-sam administration, due to strong regulation systems such as real-name financial and real estate transaction, land transaction permission, investigation into the sources of housing purchase, etc., the number of real estate transactions fell, and the number of unsold new apartments increased throughout the entire country besides Seoul. From bad to worse, Korea encountered a foreign exchange shortage crisis (international monetary crisis) in 1997, and thus land prices dropped by 46%, and housing prices fell 12.4% across the country, which totally changed the deep-rooted belief among the Korean people, the so-called myth of invisible real estate investment and ever increasing price that once you buy real estate, you can get a huge benefit from increasing prices (Kim 2013). In a bid to use housing policy as a boosting tool for economic stimulus to overcome the IMF crisis, the Kim Dae-jung administration hurriedly introduced every possible deregulation policy, such as revitalizing construction businesses, abolishing new apartment price control/small-sized apartment ratio/land transaction permission/concept of public land ownership, tax exemptions and cuts, allowing foreign investment on real estate, and so on. However, the impacts of these extreme policies were exaggerated with the help of the recovering purchasing power stemming from the low level of interest rates and shortage of housing units during the IMF period for housing price increase rate per year to reach 16.1% (apartment price increase rate 23.3%) in 2001, the highest level of increase ever since 1991 (Woo 2009). This led to the strongest and toughest housing market regulation by the next administration.

### Progressive Regime: Strong Regulation in a Bid for Public Welfare (2003–2007)

President Roh Moo-hyun administration (2003–2007) was the first progressive regime in

facto emphasizing social role rather than market autonomy in modern Korean history, because the former President Kim Dae-jung, the actual first leftist president, could not initiate progressive policies as he followed an extremely neoliberal economic agenda negotiated with the IMF on the condition of an emergent loan for Korea to overcome the monetary crisis. The main priorities of the Roh Moo-hyun administration included national balanced development, mega-sized development plans such as the so-called administrative capital city movement, and the relocation of more than 175 public organizations from Seoul to other regional areas, and these were acknowledged to bring about land price hikes all over the country. In order to curb this housing price increase starting from the late period of previous government and exacerbated from the start of current administration, they announced 3–4 housing policies almost every year focusing on strong regulation to control housing demand allegedly using all the direct and indirect tools, including expanding speculative zone, regulating reconstruction, development gain redemption, introducing total real estate tax, reviewing debt to income ratio (DTI) and loan to value ratio (LTV) as a tool to decrease housing loans, tax burden for multi-housing owners, and so on. As apartment prices in Seoul increased by more than double in 2001–2006 in spite of such demand suppress, they turned to supply policy to build more housing stock featuring a second new town plan.

### Conservative Regimes: Deregulation for Better Supply (2008–2017)

The president Lee Myung-bak (2008–2012) and President Park Geun-hye (2013–2017) administrations are regarded as conservative regimes stressing a market economy after the previous Presidents Kim Dae-jung and Roh Moo-hyun and similarly focused on deregulation and taking the residual role of government in order to recover the private function in the housing market that was almost paralyzed during the previous regimes. They implemented tax reduction for transaction, LTV deregulation, simplifying reconstruction and redevelopment, clearing speculative zones except for three districts in Seoul, supplying so-called Nest Housing at a lower price than nearby housing built in Greenbelt area, abolishing price control of apartments, and so forth. President Park Geun-hye continued deregulating policies under the umbrella name of "housing market normalization" such as alleviating remodeling process; stimulating housing transaction; LTV and DTI easiness; lowering interest rate; so-called Happy Houses as social housing, particularly for newly married couples or youth generations; and so on.

### Incumbent Regime: Stronger Regulation to Housing Price (2017–)

The administration of the incumbent President Moon Jae-in was inaugurated in 2017 following the impeachment and resignation of the previous President Park Geun-hye, and this administration, as the second progressive government after President Roh Moo-hyun, follows similar or advanced versions of President Roh's housing policies. It is worth noting that President Moon and President Roh were close friends and that president Moon was one of the presidential secretaries when President Roh's housing policy was implemented, to understand the similarity of their policy orientation. It would be premature to evaluate the impact of President Moon's housing policy, but current data shows a noticeable falling of housing prices and decreased number of real estate transactions due to the imposition of heavy tax burdens on multi-housing owners, tightening LTV and DTI (now changed to debt service ratio, DSR) regulation, and decreasing housing supply with increasing regulation on redevelopment.

## Conclusion

In South Korea, housing policies have been diverse and changed frequently with the aims of supplying more housing and controlling housing prices. With pros and cons, the implication is twofold: they successfully helped cope with ever-increasing demand for housing (ratio of number of housing units against number of households is higher than 100% in South Korea in 2017 except for Seoul and Gyeonggi-Do-province surrounding Seoul), while they provoked unexpected negative side effects

(Statistics Korea, http://www.index.go.kr/potal/main/EachDtlPageDetail.do?idx_cd=1227). For example, according to Lee (2017), announcing government plan of massive housing redevelopment with an aim to curb housing price from over-demand for housing incurred extra speculative behavior to buy land or housing located near development sites, as investors expected the prices would increase as well after finishing development.

Housing is a kind of value goods of which a proper level of consumption is beneficial for ordinary people, and thus a relevant level of government intervention is regarded to be necessary to supply the service. However, as Ball and Harloe (1992) pointed out, interactions between policy changes and existing housing structures are more complex than we expect, and we should therefore take care to clearly understand the role of institutions and its constraints to fully recognize the influences on actor in housing research. Although the South Korean experience might be unique and not applicable to other countries with different settings, it serves as another example indicating that the implementation of proactive and diverse housing policies by the government could help rapidly urbanizing countries cope with housing shortage problems.

Housing policy is a sensitive subject to politics, society, demographic environment, and economy, and the process of policy formation and implementation is influenced by the interaction among various stakeholders. Also key policy issues are closely tied with inequality in housing market by location and income. However, less attention is given to these relationship and issues since they are beyond the limit of this chapter.

# Human Capital and Meritocracy

Ani Matei and Reli Ceche
The National School of Political Studies and Public Administration, Bucharest, Romania

## Synonyms

Employeees of a public or private enterprise/institution; Evaluation and promotion based on personal merits

## Definition

Human capital is a concept of economic origin that is constantly evolving in terms of its content and structure. Most often, it includes *knowledge, skills, competences, and other attributes internalized by individuals or groups of persons, acquired over a lifetime, and used to produce goods, services, or ideas in market circumstances.*

Meritocracy is also a concept with multiple aspects and semantic approaches that determine its characteristics of *a popular doctrine that*

*access to power finds its legitimacy in the merits of efforts recognized through educational studies or the labor market.*

## Introduction

The two concepts – *human capital and meritocracy* – coexist in the literature, being in a relationship of mutual determination.

The public sector and, most often, the public administration provide eloquent examples of their interaction in terms of the need to increase performance and quality, professionalize the civil service, and support the processes of social innovation, adaptation, or digitalization.

Recent papers of Chassamboulli and Gomes (2018), Kroncke (2016), Bevia and Corchon (2017), or UNDP (2015) address theoretical models that integrate the two concepts in complex tools for assessing public and private performance, economic and social development, etc.

It is noted that, although at the beginning the prevailing conceptual approach was the qualitative one, in the last decade and a half, quantitative models based on logical and mathematical formalism are more and more frequent.

Thus, Bevia and Corchon (2017, pp. 185–192) present a dynamic model of cooperation in production in the conditions of human capital accumulation. Using a model of the Cobb-Douglas function, the authors conclude that meritocracy always has a positive effect on production, but when the elasticity of substitution is a subunit, it is only a level effect. The accumulation of human capital, specific to each generation, determines unique levels of meritocracy for which efficiency or effectiveness is obtained.

Evans and Rauch (1999) emphasize the importance of meritocratic recruitment for public office and that it is ideally based on a combination of education and examination. The Weberian scale, proposed by them, is a statistical tool with which an integrated image is created on an ideal combination of merit, career, and rewards in the public system.

Starting from the public-private comparison, the model proposed by Chassamboulli and Gomes (2018) insists on the simultaneous approach and integration in the decision-making supports of education, public sector policies, and meritocracy. Such a model allows for endogenous substitutability or complementarity between investment in education and government policies whose effects on education depend crucially on the presence of meritocracy in the public sector employment.

An interesting study, described by Krauze and Slomczynski (1985), aims to provide an answer to a controversial dispute starting from the question "how far are we from meritocracy?". The model, based on three hypotheses compatible with human capital theories, refers to the determination of social status by education, its mobility, and its inequality between educational groups.

Starting from this study, Matei and Matei (2010) present, based on a simulation based on statistical data from the Romanian civil service system, applicable conclusions on the evolution of the meritocratic framework in the Romanian public sector.

### Meritocracy and Merit

Given its most general significance, meritocracy is "a popular doctrine that access to power finds its legitimacy in the merits of efforts recognized through educational studies or the labor market" (Mahé de Boislandelle 1998, p. 263).

Therefore, the meritocracy approach accepts the hypothesis of a strong connection between individual "merits" and social reward.

For sociologists, meritocracy describes a social system that is supposed to be ideal, having the property to transmit, in its entirety, the influence of social origin on the social hierarchy, through education, and not through heritage, privilege, etc.

This type of social system is called "society without delayed effects" by Carlsson (1958) and "meritocratic society" by Boudon (1973). As specified by Krauze and Slomczynski (1985), the concept of meritocracy was taken into account in discussions of the functional theory of social stratification (Wrong 1964), integrating social status and mobility research (Boudon 1973), the future of post-industrial society (Bell 1973), as well as in the theory of job competitiveness (Thurow 1975).

In this context, the concept of meritocracy refers to a large-scale social system, presenting a positive relationship between "merit" and certain desired common values, such as income, power, and prestige (Krauze and Slomczynski 1985).

Dominant social and political discourses associate meritocracy and democracy with ideological, political, or practical significance (Connolly 1993).

In this context, Sen (2000), as well as other authors, emphasizes that democracy, in its ideal sense, supports a presumed equality of persons, while meritocracy is a justification for social inequality (Meroe 2014).

It is clear that in both the public and private sectors, merit cannot be reduced to certain qualifications or the acquisition of a level of knowledge in one or more fields, as they also include personal qualities, derived from behavioral and individual skills, mobility and flexibility in thinking and action, as well as managerial ability. This approach allows the application of a statistical treatment based on a formalized definition: a social system with the three characteristics – origin, educational level, and status – is meritocratic only if the following probability is independent of the position of origin: a person at $e_j$ educational level achieves a status $s_k$.

At the same time, this approach induces the idea of making measurable comparisons between real and ideal situations (Vlasceanu and Zamfir 1998), an idea that will be used in this chapter.

### Individual Human Capital and Social Status

Starting with the seven to eight decades of the last century, human capital has become more and more used in the conditions of the evolution of the knowledge economy for which it becomes a basic pillar.

For the tertiary sector, that of services, given the existence of a wide variety of jobs, the specificity of human capital is distinct in its assessment, increasingly complex.

According to OECD approaches, human capital comprises "knowledge, skills, competences and other attributes internalized by individuals or groups of persons, acquired over a lifetime and used to produce goods, services or ideas in market circumstances" (Westphalen 1999, p. 4).

In this context, individual human capital can be considered as representing the skills/abilities and abilities of individual workers.

Specialized studies reveal the factors that determine human capital such as skills and qualifications, level of education, and work experience. In addition to these, intelligence, personality, creativity, etc. can be added.

We also mention the fact that scientific and technological evolutions have transformed and continuously transform both the workplace and the competencies and abilities necessary to fulfill the obligations incumbent on it.

To better understand this complexity in OECD-CEDEFOP analyzes and reports, the levels and dimensions of individual human capital are described in terms of its assertion at the organizational, governmental, or, more generally, societal level (see Table 1).

Most often, human capital is valued in economic, monetary terms. This fact induces the difficulty or even the impossibility of an evaluation as close as possible to reality. Therefore, there is a need for differentiated valuation in relation to human capital levels. Such an approach is described in Table 2.

The important conclusion from this perspective is that, in each context of analysis, an appropriate theoretical and methodological framework must be established. For individual human capital, in public organizations, the evaluation used mainly refers to the diplomas and certificates obtained, declarations, and curriculum vitae by which a person proves his skills and abilities.

This approach is not unanimously accepted by specialists. The sphere and content of individual human capital are extended to intellectual capital seen as a systemic sum of human and organizational capital.

In this context, most opinions converge towards the methodological identification of individual human capital based on:

- The existence of a coherent framework that integrates the concept itself as well as its levels and dimensions
- Identifying the related processes related to the acquisition, maintenance, and development of knowledge at an individual level

**Human Capital and Meritocracy, Table 1** Level and dimensions of human capital. (Adapted from Westphalen (1999, p. 5))

| Level/ dimension | Politics | Economy | Sociology | Psychology |
|---|---|---|---|---|
| Individual | Increase skills level | Increase earnings | Increase equality | Increase self-esteem |
| Organizational | Comply with surrounding society | Increase competitiveness | Increase competitiveness | Increase competitiveness |
| | | Improve the organizational image | Improve the organizational image | Improve the organizational image |
| | | Improve work environment | Improve work environment | Improve work environment |
| Government | Complement labor market and employment policies | Share the costs related to education and training | Implement the lifelong learning concept | The notion of a dynamic government/society |

**Human Capital and Meritocracy, Table 2** Correlation methods at different levels. (Adapted from Westphalen (1999, p. 9))

| Level | Methods |
|---|---|
| Society | Investment in education relative to national wealth |
| Organizational | Investment in training relative to organizational performance |
| Individual | Years of schooling relative to life income |

- Adequate differentiation between individual and collective human capital

This methodological framework must offer the possibility to evaluate/measure the formal individual human capital – the educational level reached, the years of schooling, the professional experience – or the real individual human capital, measured through interviews, tests, examinations.

Social status, understood as the set of behaviors that the individual can expect from members of a social group, is most often correlated with the social role that incorporates the expectations of the social group from one of its members.

In theories and analyzes of social stratification, status will represent the position or rank of an individual within it.

The specialty literature also talks about the mobility of acquired social statuses, mobility asserted, especially in modern societies, but also the fact that each individual has a lot of statuses that are associated with each other, forming the so-called global status.

The social role being associated with the social status, represents, along with it, an aspect viewed from different perspectives of the same process, social phenomenon, etc.

By reducing the discussion at the level of each individual, the exercise of the individual social role is differentiated. The company has certain expectations, the most important, in the case of public administration, being those in relation to the necessary behaviors, specific to its place in administrative structures.

Individual performance will be assessed according to the full or partial fulfillment of all the requirements and obligations of the social role.

Social status is, in the opinion of many researchers, a concept of interest for multiple fields of research. According to Chen (2012), there is a constantly evolving literature on the role of social status in a monetary economy. More recent studies also include human capital. The simultaneous incorporation of human capital and social status into models of socioeconomic analysis induces the possibility of better assessment of social reality.

The fundamental assumption is that "superior social status is acquired relative to human capital" (Chen 2012, p. 4). Feathermand and Stevens (1982) demonstrate that a determining factor of social status is individual human capital. In this context, Fershtman et al. (1996) design and

**Human Capital and Meritocracy, Fig. 1** The meritocratic interaction of social status and the role of individual human capital (made by authors)

develop a general model of economic equilibrium with the social status represented by employment, which depends on human capital to study the interaction between employment and economic growth.

These considerations and approaches can be extended to broader social analyzes, establishing a framework for mutual determination between human capital, status, and social role. Even with the risk of simplification, we try in Fig. 1, to highlight the interactions, through meritocratic processes, between the concepts listed above.

According to our vision presented in Fig. 1, human capital becomes a support for social status and role. Meritocratic processes are highlighted in the form of two-way interactions, both in terms of individual human capital and social status and role.

The following approach is based on some ideas presented by Krauze and Slomczynski (1985) adapted to administrative stratification and assessment of the level of meritocracy in public service systems. An approach in this direction was also made by Matei and Matei (2010).

The research is current, given that, at least for the public sector, public management reform strategies in both EU Member States and other organizations, such as the OECD, reveal the following as basic objectives: professionalization of the public service and, therefore, the recruitment and promotion of civil servants exclusively on substantive criteria.

We find the arguments for such an approach in literature and specialized studies. Thus, Bowman and West (2007), discussing public service reform and merit systems, emphasizes that "The role of the merit system in American democracy is a critical subject for investigation... an important obligation of the government is to be a model employer in society, to set a high standard to which others can aspire and to provide the opportunity to work that honors fairness in the employer-employee relationship."

Even not directly connected to the public sector, we quote Husen (1974), who states: "... meritocratic tendencies ... are inherent in highly industrialized societies," Krauze and Slomczynski (1985, p. 625) or Bell (1973, p. 35), who state: "the post-industrial society represents a meritocracy in its logic."

## Hypotheses and Principles for a Socio-statistical Model

The model proposed by Krauze and Slomczynski (1985) is based on some hypotheses that we will use and adapt to the context of the public sector. These hypotheses were also used by Matei and Matei (2010). In the context of this paper, our approach will follow this last paper, operating, when necessary, changes adapted to the current context of analysis.

(a) Individual merits are circumscribed to the sphere of educational meritocracy. Therefore, any person who has acceded or accedes a public position will have a certain educational level, a level acquired both by basic education in schools or universities and continuous education within the framework of some specific programs, organized by specialized institutions. This level of education will determine the accumulation of individual human capital that will be the support of the social status of that individual. Regarding these, we can distinguish several social statuses, $e_i$, $i = \overline{1,m}$, a certain number of people corresponding to each level.

(b) Within the public sector, there is an administrative stratification, in which each level of civil service is characterized by a social role. The social roles $s_j, j = \overline{1,n}$, are distinct and the access to these civil services is achieved according to the conditions stipulated in specific laws.

(c) The public sector is characterized at a certain moment $t_s$ by a number N of persons, with a social status $m$, holding N public positions, grouped into n social roles. The multitude of roles of a system of public functions at a given time can be defined by a matrix $X = (x_{ij})$, $1 \leq i \leq m$, $1 \leq j \leq n$, that describes an empirical, double varied distribution of the civil service, meritocratically classified, entitled observed distribution.

Corresponding to this distribution, two ideal distributions are created, a "meritocratic" one $M = (m_{ij})$, $1 \leq i \leq m$, $1 \leq j \leq n$, and a random distribution $R = (r_{ij})$, $1 \leq i \leq m$, $1 \leq j \leq n$. Analyzing the meritocratic finality, the above-mentioned authors take into consideration possible theoretical transitions from the initial status, $t_s$, to the above-defined final, ideal statuses. Related to the "distance" to those ideal statuses, we could conclude on "proximity" to meritocratic distribution or the random distribution.

(d) The transition from the observed empirical distribution to another distribution requires a certain mobility of the status among the educational groups, a certain change for determining the status by education and a certain change in the inequality of the status. If the meritocratic thesis is valid, none of the three hypotheses should be rejected (Krauze and Slomczynski 1985, p. 626). Briefly, Krauze and Slomczynski (1985) formulate the following three hypotheses:

**Ip.1.** *Hypothesis concerning the mobility of status*

In a public sector based on meritocracy, the number of persons who would change the status as a result of transition to meritocratic distribution is less than the number that occurs further transition to random distribution.

**Ip.2.** *Hypothesis on determining the status*

The absolute growth in determining the status by education that would occur as a result of transition to meritocratic distribution is less than the one that occurs due to transition to random distribution.

**Ip.3.** *Hypothesis concerning the inequality of status*

The absolute growth due to inequality of status among groups as a result of transition to meritocratic distribution is less than the one that occurs due to transition to random distribution.

(e) Generally speaking, the meritocratic thesis has got the functional theory of social stratification as a key pillar, transposed in terms specific for the public sector, in the so-called administrative stratification. At the same time, meritocratic distribution represents the core objective of the functional theory of stratification stipulating, as shown by Davis and Moore (1945), that the most appreciated public positions are "in a conscious manner held by the most qualified persons."

(f) The sociologic literature defines meritocratic distribution in the principle: "higher is the level of education/social status for a person, higher should be his/her social role" (Krauze and Slomczynski 1985, p. 627).

(g) Krauze and Slomczynski (1985) reformulate this principle, in order to be applicable and to enable transition from any observed distribution to meritocratic distribution. The new principle, obtained by reformulating the above-mentioned principle, using mechanisms of bivalent logic is expressed as follows: "the persons with higher education should not have a lower social role than those with less education."

## Conclusions

As we have shown in the introductory part of the chapter, the current research approach aims at substantiating and presenting more extensively the intrinsic link between human capital and meritocracy.

The two concepts have benefited and benefit from an important attention and interest in social research worldwide. The attempt to establish the connection we are talking about has placed before us, on the one hand, the analysis of several social concepts and contexts – human capital, social status and role, meritocracy – and their placement in a deductive logic that highlights both evolutions and specific interactions.

On the other hand, the finality proposed in the chapter – that of analyzing the impact – determined the need to use and adapt a socio-statistical modeling that, in a more general form, we found in the literature.

It should be mentioned, however, in this context that the analysis and deepening of the mentioned concepts "benefits" from a controversial sociological and educational context. Debates in the 1980s, well known to specialists, such as social mobility (Hauser and Grunsky 1988), the discrepancy between conceptual and empirical reality regarding the level of meritocracy in some developed states, etc., they led to the restriction of the analysis area and to the operation with reductionist hypotheses that can distance the study from the social reality.

In this context, it must be emphasized that the analysis will certainly have to be completed with other qualitative analyzes meant to bring the model closer to reality.

The advantage of this approach, however, is undeniable from several perspectives. Thus, we can conclude that:

- The structure and content of the chapter offer objective elements and arguments regarding the way in which meritocracy regulates the bivalent relationship between formal and real human capital or, more generally, between status and social role.
- The basic concepts of the work, human capital in its various forms or social status and role, are private facets from different perspectives, of a single social phenomenon determined by educational levels and position in administrative systems.
- The chapter establishes, even if in an incipient phase, the logical and functional determination between human capital and the status and social role in the public sector. The public sector thus becomes a new model of social subsystem in which meritocracy has specific values.
- The need to associate such a theoretical analysis and an empirical analysis, remains a desideratum so that, even in this case, we can highlight or remove objectively, the contradictory interpretations.
